JUNE 30, 1917.

THE
GARDENERS' CHRONICLE

A Weekly Illustrated Journal

OF

HORTICULTURE AND ALLIED SUBJECTS.

(ESTABLISHED IN 1841.)

VOL. LXI.—THIRD SERIES.

JANUARY TO JUNE, 1917.

LONDON:

41, WELLINGTON STREET, COVENT GARDEN, W.C.

1917.

INDEX OF CONTENTS.

JANUARY TO JUNE, 1917.

(FOR SPECIAL HEADINGS SEE UNDER BOOKS: CERTIFICATES; LAW NOTES; NURSERY NOTES; OBITUARY; PLANT PORTRAITS; PLANTS, NEW; SCIENTIFIC COMMITTEE; SOCIETIES; AND ILLUSTRATIONS.)

A

ABBOTT'S WOOD, Godalming, shrubs damaged by frost at, 160
 Abies Douglasii in chalky soils, 50
 Acer Davidii, 46
 Acetylene gas, forming by means of, 126
 Aciphylla Colensoi at Leontidejler, 255, 265
 Acorns and Chestnuts from Verdun, 6

Agricultural education for disabled men, 254
 Agricultural organisation in France, 36

Albanum plat-antibolium, 17
 Alcedium House, Elstree, the gardens in winter at, 95; the effect of frost on shrubs at, 124

Allahabad, flower shows at, 19, 230
 Allotments, 194, 201; a manual on, 204; free watering of, in America, 214; in Belfast, 155; in Brussels, 145; in Edinburgh, 6; in France, 127; in Glasgow, 161; in Leeds, 110; in Scotland, 87, 126, 127; in West Scotland, 141; method of cropping of, 154; operations in, displayed on the cinematograph, 194; protection of, 261; rights of holders of, 211; Sunday labour on, 127

Almond, flowering of, 175
 Alpine garden, the, 211, 241
 Alpines, the cultivation of, without a rock garden, 211

America, allotments in, 214; exports of Apples from, 41; free gift of seeds in, 83; note the hardness of, 211, 222, 242, 260

American Apples, a trial of, 116
 American blight, specific for, 27
 American President's appeal for in crossed crops, 162

Anemone Pulsatilla, 209, 226; A vitifolia, 88

Antirrhinum, rust disease of, 155
 Aphid eggs, 22

Aphis, woody, specific for, 27
 Apriay, the 167, 177, 255

Apple Allington Pippin, 152
 Apple Chelmsford Wonder, 40

Apple blossom, the glory of, 225
 Apple sucker, the story of, 251

Apple trees, development of fruit buds in, 40; development of rot fungus at different temperatures, 156; scab and canker diseases of, 57; pruning newly planted, 152; top grafting, 150

Apples, American exports of, 41; mysterious spotting of, 40; top grafting, 150; trial of American, 116

Appointments, agricultural, 7
 Artichokes, Globe, 2; Jerusalem, 60, 129

Artificial manures, 82
 Ascorb, food production under glass at, 174

A-poracous, a rust resistant, 214
 Astelia Banksii, 22
 Austria, note from, 95

Australian vegetable resources, 224
 Avicenna officinalis, the Grey Australian Mangrove, 56
 Azolla caroliniana and Mulgedium Plumieri as garden escapes, 255, 247

B

BACTERIA, nitrogen-fixing, 144
 Bacterium campestris; Black Rot disease of Cabbage, 115

Barley, L. H. *The Standard Cyclopedia of Horticulture*, 74

Barlow, Mr. A., appointment of, 7
 Barlow, Mr. Graham, honour for, 235

Batley, Capt., awarded the Cross of the Legion of Honour, 7

Beaulieu grown in shade, 85, 154
 Barley, the cultivation of, 112

Boston, Harold *British Insects and How to Know Them*, 245

Bathurst, Capt. Charles, appointment of, 6

Batsford, Park, Gloucestershire, effect of frost on plants at, 245

Beans, Broad, 221, 222, 242; Butter, 167, 191, 201, 212, 221, 251

Dutch Haricot, 202; Haricot, 107; Mastapepe, 142; Mont d'Or, 142; Wax pod (see Butter Beans for cattle, 67; for drying, 201; planting of Runner, on lawns, 166, 181; Runner, grown without supports, 153; varieties of, suitable for drying, 112

Bees, the management of, 167, 177, 253

Beet, 54, 123; for preserves, 119; the hardness of, 211, 222, 242, 260

Beets, Spinach, 50, 115; sugar, 30, 119, 125, 208; R.H.S. trial of, 242

Belfast, allotments in, 155
 Belgian Committee, address of the, 62

Belgian gardening at Letchworth, 87

Belvoir, spring flowers at, 29
 Benevolent Institution, Gardeners' Royal, 6; annual meeting, 42; Worcester Auxiliary of the, 344

Bestest to a gardener, 6, 62
 Berberis subacaulata, 53

Birds and fruit buds, 53; as allies, 251

Black Currant, abnormal flowers of, 160

Blenheim Palace, Woodstock, Orchids at, 53

BOOKS, NOTICES OF, **Algae** (*W. S. Hooper*), 110; Allotments and Small Gardens in War Time (*Austin & McLean*), 79, 65; Animals and Biennials (*Centradie J. L. Lyle*), 3; **B-etamed** Magazine, 154, 265; British Grown Timber and Timber Trees (*Lucas D Welch*), 3; British Insects and How to Know Them (*Harold Bustin*)

245; **Census of New South Wales Plants** (*J. H. Maiden*), 195, 225; **Centers and Taxids of Japan** (*E. H. Wilson*), 179; **Cropping of an Allotment of Small Kitchen Garden** (*Royal Horticultural Society*), 154; **Cultivation and Manuring of the Kitchen Garden** (*Royal Horticultural Society*), 64; **Culture of Profitable Vegetables in Small Gardens** (*Station and Sons*), 63; **Early Pests** (*L. Geoffrey Henslow*), 205; **Enquiry into Plants and Minor Works on Odours and Weather Signs** (*Alephrastus*), 209; **Field Notes on Sweet Peas** (*Leslie L. Morse and Frank G. Cuthbertson*), 100; **Food, Fruit and Flowers** (*Walter P. Wright*), 139; **Food Production in Cottage and Allotment Gardens** (*S. Hosking*), 112; **Forest Flora of New South Wales** (*J. H. Maiden*), 225; **Genus Eucalyptus** (*J. H. Maiden*), 148; **Herb Cataloguing for Boys and Girls** (*Mrs. L. Chamberlain and Miss E. C. W. Hocking*), 127; **Herbs Used in Medicine** (*Mrs. John D. Ellis*), 115, 250; **Hints on Potato Growing** (*L. J. Allsop*), 100; **Johnsons' Gardeners' Dictionary and Cultural Instructor** (*J. Vasey and A. Hensley*), 140; **Jottings of a Gentleman Gardener** (*M. F. Ellis*), 225; **List of the Most Desirable Varieties of Most Kinds of Fruits** (*Royal Horticultural Society*), 166; **Making and Manuring of an Allotment** (*L. S. Gully*), 204; **Notes on Medicinal Plants** (*L. Hosking*), 100; **Nuts; a Profitable Crop for Waste Land** (*G. Bingham and Co.*), 64; **Orchid Review** (*H. A. Bulley*), 76; **Parish War Societies** (*William Richard Bodley*), 23; **Plantae Wisconsinense** (*C. S. Sargent*), 127, 111; **Pruning Manual** (*L. H. Baily*), 135; **Publications Received**, 3, 16, 23, 53, 64, 76, 112, 127, 166, 176, 305, 225, 245, 264

Rockeries: How to Make and Plant Them (*H. E. Thomas*), 169; **Rose Annual** (*H. R. Dainton and Century Page*), 244; **Science and the Nation** (*L. C. Seward*), 239; **Select Varieties of Roses and Instructions for Pruning** (*National Rose Society*), 121; **Sweet Pea Annual** (*J. S. Broughton*), 40; **The Worker's Garden** (*Frank H. Butler and Cyril Harding*), 112; **Tropical Agricultural type** (*Hubert Vernon H. Jeay*), 81; **Vegetable** (*Henry J. Day*), 225; **Vegetable Culture for All** (*Evans*), 195.

Broccoli or Kale, 50
 Boston, U.S.A., flower show at, 127

Bottles for fruit preserving, 232

Bracken as a vegetable, 119, 126; the use and eradication of, 244

Bradford, hizzard at, 156

Brassicas, nitrates for, 252

Brasso-Cattleya Cynthia, 190
 Brasso-Laelia Jessica, 220

Brasso-Laelia-Cattleya Admiral Sams, 230; B. L. C. Diana, 121; B. L. C. Rumania, 22

Breeding, "pure line," 224
 Briscoe, Mr. T. W., 19

Broad Beans, 221, 222, 242
 Broccoli, the hardness of, 212; the planting of, 221, 252

Brooklyn Botanic Gardens, Nephrolepis in, 64
 Brown-rot disease of fruit trees, 54, 153

Brugmansia arborea, 52
 Bulbs, allotments in, 145

Brussels Sprouts, 59, 90, 161, 171, 181, 206, 211, 212, 222

Buckwheat, 177
 Bulb garden, the, 115

Bull-growing on Pacific Coast, 63
 Bulbs, home-grown and foreign, 115; imports of, from France, 185; cold storage of, 65

Business names, the registration of, 101

Butcher, Gerald W. (*The Worker's Garden*), 112

Butter Beans, 107, 191, 201, 212, 221, 251

C

CABBAGE, black rot disease of, 115; for feeding cattle, 157

Cabbage root fly and tarred felt discs, 127

Cabbages, 50, 228, 260
 Calanthes, effect of fog on, 33

Calceolaria Burbidgei, 53; origin of, 76

Calyces, tearing of, 238
 Calyx splitting in Carnations, some causes of, 7

Campanula Ephestra, 190; C. speciosa, 166; C. Stansfeldii, 39

Carnations, causes of calyx splitting in, 7; new varieties of Perpetual Flowering, 51

Carrots, 59; as a farm crop, 120
 Castlewellan, fire at, 17

Catalpa, old seed and plant, 9, 29, 41, 54, 65

Catalpa, regulations concerning the issue of, 110

Caterpillars, a plague of, 229, 255
 Cattle, Beans for, 67; Cabbage for, 157; fattening of, 90

Cattleyas: Eileen, 190; Rainbow, 45
 Cecil, Mr. Evelyn, honour for, 235

Celery, 59, 191; as a green vegetable, 171; R.H.S. trial of varieties of, 47
 Celery fly, the, and Parsnips, 261
 Census of agricultural stock, 177
 Centenarian gardener, a, 127

- CERTIFIED PLANTS:** *Androsace* ciliata, 176; *Antifonium Prina* Donna, 236; *Brasso-Cattleya* Bianca var. *Daphne*, 102; B. C. Lady Jellicoe, 137; *Brasso-Latho* Cattleya Jean var. *Mrs. Gratrix*, 102; *Carnation* Maldwin Drummond, 236; *Cattleya* Cowaniana alba, 206; C. C. alba var. *Princess*, 147; C. *Enid* var. *Mrs. Gratrix*, 102; C. *Enid* var. *Silver Queen*, 138; C. *Enid* alba var. *Fairy Queen*, 147; C. *Mabel*, 102; C. *Mendellii* Fairy Queen, 247; C. *Schröderae* var. *Manda*, 206; *Corylus* *Avellana* contorta, 30; *Cyclamen* *Cherry* *Ripe*, 101; *Cyclamen* *Crimson* *St. George*, 30; *Cymbidium* *Alexanderi*, 128; C. A. *exquisitum*, 102; C. A. var. *Celeste*, 206; C. *insigne* album, 101; C. *Mars*, 206; C. *Schlegelii* *Conyngham* var. 55; C. *Sch. roseum*, 55; C. *Sybil* *Conyngham* var., 128; *Cypripedium* *Acteas* *Cainiae* *Harefield* *Hall*, 10; C. *Aethea*, 10; C. *Clarke* var. *compactum*, 128; C. *Erythraea* *The Baron*, 137; C. *Garland* var. *Lord Northbourne*, 65; C. *Greyii* *magnificum*, 206; C. *insigne* *speculatum*, 55; C. *Iona* *Carter* *Place* var. 128; C. *Lathamianum* var. *Cardinal* *Mercier*, 30; C. *Marshal* *Haig*, 55; C. *Nigger*, 30; C. *niveum* *The Grange* variety, 237; C. *Persius*, 147; C. *Ranji*, 167; C. *Traceyanum* var. *Percy*, 55; C. *Verdun*, 55; *Dendrobium* *Atherton*, 147; D. *Chelye* *West Point* var. 147; D. *Illustra* var. *Florence* *Bartlett*, 196; *Dontzia* *Vilmoriniana*, 236; *Eulophella* *Rolfæ*, 101; *Exochorda* *macrantha*, 216; *Freesia* *La France*, 76; *Iris* *Rindove*, 236; *L. sibirica* *Perry's Blue*, 236; *Laelio* *Cattleya* *amabile* var. *Ashlandiae*, 10; L. For Advertisement Charges see page vii.

SANDER AND SONS, Oldfield Growers, St Albans.

NOW IS THE TIME TO PLANT **KELWAYS' COLOR BORDERS**

By sowing Kelways' Plants arranged to give a succession of bloom during the Spring, Summer, and Autumn. NOW THAT LABOUR IS SCARCER these borders solve the difficulty of having a Garden always in bloom without the trouble of replanting and lifting the plants every year.

Plant a border this Autumn and you will be able to enjoy its beauty for several years without any additional expense.

Send the measurements of your beds or borders and we will recommend a selection of plants suitable for your district, and quote our special reduced War prices. Extract from a letter received from "29/11/16.

"Last year, this month I believe, I wrote you re Kelways' plants, when you submitted price list. I also took a proof and plan from you, and finding he was much obliged, I gave him an order for over £3 worth of plants.

"To my regret, the plants were hardly worth growing, and the plan scheme was so bad that I have just disposed of them and given them away."

WATERER'S GOLD MEDAL RHODODENDRONS. We cordially invite you to come and select any plants you require. We have over 80 acres, comprising the finest collection in cultivation. Call on free. **JOHN WATERER, SONS & CRISP, LTD.,** The Nurseries, Bagshot, Surrey.

GUSHURST COMPOUND. Insecticide and Fungicide. Over 50 years' reputation; highly Commended R.B.S. Seventy-eight Control Trials at Wisley 1914-15. Sold by Dealers in Garden Sundries, Wholesale. **FRIE'S PATENT CANDLE CO., LTD.,** Battersea, London, S.W.

WANTED, 1,000 Large ASPIDISTRAS, old plants suitable for stock, cash or exchange. See other advertisements; catalogues free—SMITH, London Fern Nursery, Longborough Junction, London, S.W.

WANTED, large Kentia Fosteriana PALMS, from 5 to 25 feet in height, for cash or exchange.—ROBERT GREEN (1911), LTD., 28, Crawford Street, London, W.

WANTED, 500 good TURFS, for Bowling Green.—Reply, G. BENNETT, Hon. Secretary High Wycombe Bowling Club, High Wycombe.

WANTED, Particulars, Prices, and Quantities of Erica carnea, Calluna vulgaris, &c., Kalnia latifolia, &c. to 30 ft. and grown Outlanders and Olear of Lebanon, to FREDERICK MARTIN, Bourne Place Gardens, Hildenborough, Kent.

PLANTS, &c., FOR SALE.

ROCK GARDEN PLANTS, Where and In What Soils to Plant Them," with Catalogue, free on application. Special selections, 12, 3s. 6d.; 25, 6s. 6d.; 50, 12s. 6d.; 100, 25s. All different, named, strong stock.—G. R. PHIPPS, Alpine Nursery, Barnham, Bognor.

MISCELLANEOUS.

EXPENSIVE ADVERTISING. In these days, when every firm has to advertise or see its business decline, it is necessary to make sure that the beneficial publicity is so obtained that the results justify the expenditure. It is this consideration that has led most keen business men to discontinue the wasteful method of advertising by catalogue. If enquiries be made of any printing firm it will be found that catalogue printing has fallen away since the war by about 80 per cent., nor is this to be wondered at. The price of paper is nearly three times what it was formerly, printing rates are higher, and the cost of postage is much increased, so that the wholesale distribution of large catalogues is now too expensive for business purposes. The newspapers, though they themselves are produced at much greater expense all round, have nevertheless refrained from increasing their prices for advertisements, and it is by utilising these permanent media that profitable advertising may still be practised.

SELECT LIST OF BOOKS ON GARDENING.

To be obtained at the "GARDENERS' CHRONICLE" OFFICE from the Publisher.

Prices Quoted are in all Cases Post Free to any part of the United Kingdom.

- Orchids, Fertilisation of.** By Chas. Darwin. Illustrated. 2s. 11d.
- Orchid Growers' Manual.** By the late B. S. Williams. 800 pages. Numerous Illustrations. 16s. 8d.
- Pansies and Violets.** By D. B. Crane. Paper. 1s. 2d.; cloth, 1s. 9d.
- Pears and Plums, The Book of.** By the Rev. E. Bartrum, D.D. Illustrated. 2s. 9d.
- Pinus, The Genus.** By George Russell Shaw. Price £2 15s. 6d.
- Plant Breeding.** Being Five Lectures upon the Amelioration of Domestic Plants. By Prof. J. H. Bailey. Illustrated. 5s. 4d.
- Plant Life.** By C. A. Hall. £1 0s. 6d.
- Practical Plant Physiology.** By Frederick Keeble, F.R.S. Illustrated. 5s. 10d.
- Practical Tree Repair.** By Elbert Peets. The Physical Repair of Trees—Pruning and the Treatment of Wounds and Cavities. Illustrated. 7s. 11d.
- Plants and Trees, Diseases of Cultivated.** By George Massoe. Well Illustrated. 7s. 11d.
- Plants, A Popular Treatise on the Physiology of.** By Dr. Paul Soreau. Translated by F. E. Weiss, D.Sc. With 53 Illustrations. 9s. 6d.
- Practical Tree Repair.** By Elbert Peets. A pioneer Text book of Tree Surgery. Fully Illustrated. 7s. 11d.
- PRESENT DAY GARDENING.** Edited by R. Hooper Pearson, Managing Editor of the GARDENERS' CHRONICLE. Each of the seventeen volumes following contains 8 full page Coloured Plates. 1s. 10d. each.
- Sweet Peas.** (Second and Revised Edition, 1914.) By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition," by Thos. Stevenson.
- Pansies, Violets, and Violets.** By William Cuthbertson and R. Hooper Pearson.
- Daffodils.** By the Rev. J. Jacob. With Preface by the Rev. W. Wilks, M.A.
- Orchids.** By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.
- Root and Stem Vegetables.** By the late Alexander Dean.
- Carnations and Pinks.** By T. H. Cook, Head Gardener at Sandringham; James Douglas, V.M.H.; and J. F. McLeod, Head Gardener to the late Mr. Pierpont Morgan.
- Rhododendrons and Azaleas.** By W. Watson. With Preface by Sir F. W. Moore, M.A. (The first popular volume published on this subject.)
- Lilies.** By A. Grove. With Preface by H. J. Elwes, F.R.S.
- Apples and Pears.** By George Bunyard, V.M.H., Chairman of R.H.S. Fruit Committee.
- Irises.** By W. R. Dykes, M.A. With Preface by Prof. Bayley Balfour, F.R.S.
- Annuals.** By Charles H. Curtis.
- Rock Gardens.** By Reginald Farrer. With Preface by Dr. J. Bretland Farmer, F.R.S.
- Chrysanthemums.** By Thomas Stevenson. With Chapters by Charles E. Shea and C. Harman Payne.
- Tulips.** By Rev. Joseph Jacob, member of R.H.S. Tulip and Daffodil Committee.
- Dahlias.** By George Gordon, President of the National Dahlia Society.
- Roses.** By H. R. Darlington. A double volume, 2s. 10d. and 3s. 10d.
- Climbing Plants.** By William Watson, A.L.S. With introduction by William Robinson, author of "The English Flower Garden." 2s. 10d. and 3s. 10d.
- Primula, Handbook of the Hardy.** By H. M. Paul. An Illustrated Work on the Culture, Mode of Growth and Utility of Primulas. 1s. 11d.
- Pruning.** A Compendium of Outdoor Work, with special chapter for Small Holders. Reprinted from the "Fruit Trades' Journal." Illustrated. 1s. 1d.
- Pruning, The Handy Book of.** With Chapters on Grafting and Budding. By James Udale, with introduction by the Right Hon. Viscount Cobham. New Edition. Illustrated. 1s. 9d.
- Rock and Alpine Gardening.** By H. Hensley, rockwork expert. A practical guide to the making of Rock, Alpine, Wall and Water Gardens. Profusely Illustrated. 1s. 6d.
- Rock Garden, The English.** By Reginald Farrer. A complete dictionary of Hardy Plants suitable for Rock Garden Culture. Contains 500,000 words and 300 Illustrations. In 2 Vols. Price, £2 2s. 10d. post free (in the press).
- Rose, The Book of the.** By Rev. A. Foster-Mellier, M.A. Illustrated. New Edition. 5s. 5d.
- Roses for the Garden and Greenhouse.** By John Weathers. Description, Culture, Propagation, Manures, etc. Coloured Illustrations. 5s. 4d.
- Roses in Pots.** By Wm. Paul. Ninth Edition. An invaluable Guide to the Cultivation of Roses in Pots, whether for forcing or otherwise. 2s. 2d.
- Roses, their History, Development and Cultivation.** By Rev. J. H. Pemberton. Illustrated. 10s. 11d.
- Salads and their Cultivation.** By T. W. Sanders. How to grow them in the Open, on Hot Beds, and under Glass, etc. Freely Illustrated. Paper, 1s. 2d.; cloth, 1s. 9d.
- Saxifrages or Rockfoils.** By W. Irving and R. A. Malby. A practical work on the Culture of Saxifrages. Well Illustrated in Colour and Half-tones. 2s. 10d.
- Soil, The.** By A. D. Hall, F.R.S. An introduction to the Scientific Study of the Growth of Crops. New Edition. 5s. 5d.
- Species and Varieties, their Origin by Mutation.** By Prof. Hugo De Vries. Second Edition. 21s. 6d.
- Strawberry Culturist, The Illustrated.** A Book worthy of the attention of Raisers of New Varieties, as of the General Cultivator. 1s. 7d.
- Strawberry, The Book of the.** With Chapters on the Raspberry, Blackberry, Loganberry, Japanese Wineberry, and Allied Fruits. By Edwin Beckett. Illustrated. 2s. 9d.
- Sweet Peas.** (Second and Revised Edition.) By Horace J. Wright. Contains 8 Coloured full-page Plates. With Chapter on Sweet Peas for Exhibition by T. Stevenson. 1s. 10d.
- Sweet Peas and Antirrhinums.** By William Cuthbertson. 1s. 3d.
- Teratology, The Principles of Plant.** By W. C. Worsdell, F.L.S. Containing a large amount of new and interesting information. Illustrated. Price 25s. 8d.
- Tomato Culture for Amateurs.** By B. C. Ravenscroft. Illustrated. New Edition. In paper, 1s. 3d.
- Tomato Culture for Market.** By J. Stoddart. 1s. 1d.
- Topiary, The Book of.** By C. H. Curtis and W. Gibson, of Levens Hall. 2s. 10d.
- Trapping of Vermin and Birds, Practical.** By W. Carnegie. 1s. 3d.
- Trees: A Woodland Notebook.** By the Rt. Hon. Sir Herbert Maxwell, Bart., F.R.S., LL.D. 22s.

BULL'S SHRED

THE

Fumigant for 1917.

A PERFECT SHRED—AT LAST !

And certain death to all insect pests in greenhouses.

We have no hesitation in proclaiming this to be the most efficacious and economical fumigating shred on the market.

DIRECTIONS FOR USE.

Place the shred in heaps on the ground, light in three or four places and leave to smoulder.

Sufficient to fumigate 20,000 cubic feet of space, in sealed packets, 5/- per lb.

NOVELTIES OF 1916.

ORCHIDS

A REVIEW of the Orchids during the past year discloses the fact that hybrids have been pre-eminent in 1916, though they had been very few novelties amongst species and varieties of species. The only new species of importance was the New Guinea *Dendrobium Wollastonii*, which flowered at the gardens of the Hon. N. Clais, Rotterdam, at Ashton Wood, Urdie. It will be seen from the lists of new hybrid Orchids published in these pages from time to time that 340 novelties flowered for the first time last year. The plants were almost equally divided amongst amateurs and nurserymen, although probably some of the amateur exhibits were acquired by purchase. As most of these hybrids have not yet proved their worth for gardens, we propose to deal only with novelties certificated by the Royal Horticultural Society. The awards of the R.H.S. Orchid Committee in 1916 included fourteen First-class Certificates and sixty-seven Awards of Merit, of which two were withdrawn, as the exhibitors failed to comply with the rule that flowers of certificated plants must be placed at the Society's disposal for painting. The Society's collection of illustrations of certificated Orchids compiled since 1896 numbers 2,335, and is constantly referred to by the Orchid Committee for comparison with plants entered for awards. Cattleyas, Laelia Cattleyas, Odontiodas, Odontoglossums, Miltonias, Cypripediums and Sophronitis crosses continue to be favourites.

Exhibits from amateurs began to decline in numbers at the commencement of the war; Lieut. Col. Sir Geo. L. Holford has entirely ceased showing, whilst other well-known growers have only shown occasionally. The death of Mr. J. Gurney Fowler was a great loss to the Orchid world and to horticulture in general.

Sir Jeremiah Colman, Bart., Gattou Park, Surrey (gr. Mr. Collier), showed many good hybrids raised at Gattou, the most interesting being *Vuytstekeara Colmanii*, an elegant cross

between *Miltonia Warszewiczii* and *Odontioda Bradshawiae*. This exhibitor received Awards of Merit for *Odontoglossum Lambaebanum* var. *Gattou Prince*, and *Laelio-Cattleya Isabel Sander* var. *Gattou Queen*. The Duke of Marlborough, Blenheim, Woodstock (gr. Mr. J. Smith), secured First-class Certificates for *Laelio-Cattleya Britannica* Blenheim variety and *L.-C. Isabel Sander* Blenheim variety, both showy Orchids, and an Award of Merit for *L.-C. Weedonaurea*.

The late Mr. Gurney Fowler showed the noteworthy *Odontioda Joan Fowler's* variety in the month before he died. The remarkable *Odontoglossum ardentissimum* Memoria J. Gurney Fowler, which was exhibited by Miss Fowler from the Brackenhurst collection, secured a First-class Certificate, and is unique in its section, the corolla being ruby red blotched with *O. crispum* Solms, which is species crossed with *O. Pescatorei*, produces it, appearing in that plant alone.

Dr. Miguel Lacroze, Bryndir, Roxborough Lane, a comparatively new but enthusiastic Orchidist, secured Awards of Merit for *Laelio-Cattleya Bionis Aves*, a showy cross between *L.-C. luteo-helveticus* and *L. Emil*; *L.-C. Thymé* Bryndir variety, a rich yellow flower with dark labellum-edged lip; the bright red *Odontioda Elm Bryndir* variety; and *Brasso-Laelio Cattleya Queen of the Belgians*.

R. Windsor Rickards, Esq., Fisk Priory, Monmouthshire, a great fancier of *Cypripediums*, obtained a First-class Certificate for the large and handsome *Cypripedium* Mrs. Hilary Jenkinson, and Awards of Merit for the yellow and white *Cypripedium John Cypher* and *C. Chardwar*.

F. M. Ogilvie, Esq., The Shrubbery, Oxford (gr. Mr. Bahntorf), showed *Odontoglossum ardentissimum* The Shrubbery variety, of rich claret colour with white margin; *Miltonia vexillata* The Shrubbery variety, bright rose with white work on the lip; and *M. Hyacinth* var. *F. M. Ogilvie*, a charming, delicately tinted form, for each of which an Award of Merit was given.

Ernst G. Meitling, Esq., Woburn Place, Addison-st. Mr. Stevenson, obtained a First-class Certificate for his handsome *Odontoglossum Memoriae* var. *Memoriae* available on October 24, and Awards of Merit for *O. pectinatum* var. *Naxos* and *Laelia Fata*, the latter a remarkable cross between *L. flava* and *L. Loma* G. W. Earl, Esq., The Manor House, Wickham, obtained a First-class Certificate for *Odontioda Gladys* and Award of Merit for *Olea Aurora*; Mrs. N. C. Cookson, Oakwood, Wylam, obtained an Award of Merit for *Cypripedium A. J. H. Smith*, with pretty, wax-like white flowers with violet purple markings; G. F. Moore, Esq., Chardwar, Bontton on the Wat., an Award of Merit for *Cypripedium Madame Albert Fey* var. *Chardwar* variety, the award being won by Patricia Ball, Esq., Ashford Park, Surrey, for *Cattleya Venus var. Victoria*, a beautiful yellow and ruby red form; and Cyril Mann, Esq., for Lycaete Skinner; Mrs. G. Hamilton Smith.

NURSERYMEN'S EXHIBITS.

Messrs. Armstrong and Brown, Orchidhurst, Timberidge Wells, who have added to their responsibilities by taking over the extensive block of Orchid houses at Brackenhurst, have been very successful in the raising, flowering and exhibiting of new Orchids. They were awarded three First-class Certificates, thirteen Awards of Merit, and had a monopoly of the Awards of "Preliminary Commendation," securing nine for new *Odontoglossums* and three for *Odontiodas*, the plants being shown with first flowers of remarkable beauty. The First-class Certificates were given for *Sophro-Cattleyas* Rex Orchidist variety and *Sa Mervyn Buller*, both of fine colour; and *Brasso-Laelio Cattleya* The Baroness Orchidist variety, a flower of perfect shape and clear, citron-yellow colour. The Awards of Merit were

given for *Cattleya Chlorina alba*, C. Monastri, C. Prince John Orchidist variety, C. Saturn Orchidist variety, C. Venus Orchidist variety, *Cypripedium Wm. Lloyd* var. Negro, chiefly of a blackish-purple colour; *Laelio-Cattleya Golden Wren*, L. C. Lady Munningham Buller, L. C. Maquoda, L.-C. Erzerum, L.-C. Sir Mervyn Buller; *Miltonia vexillaria* Drounought, one of the largest rose-pink forms, and *Miltonia Frank Reader*, a very handsome variety with rose-coloured flowers of fine shape and a rich ruby mask to the lip.

Messrs. Charlesworth and Co., Haywards Heath, sustained their reputation for fine novelties, winning four First-class Certificates and twelve Awards of Merit. The First-class Certificates were gained by *Brasso-Laelio-Cattleya Joan var. Verdun*, a rich yellow flower; *Laelio-Cattleya Antinous*, L.-C. Momus, a showy dwarf hybrid between *L. C. rubens Lambaebanum* and *C. Octave Doin*; and *Odontoglossum The Czar*, which, as shown on March 7, was one of the finest dark *Odontoglossums* and one of the best specimens shown. Awards of Merit were received by *Cattleya Trianae* Roehling's var., a fine flower with bands of claret-red in the petals; *C. Rosta*, an attractive white-petalled flower; *C. Venus Golden Queen*, *Laelio-Cattleya General Letchitsky* and *L. C. Serbia*, the last having much of the large size and fine form of its parent, *L. C. St. Gothard*; *Miltonia Isabel Sander* Charlesworth's variety, *Odontioda Alcantara*, *O. Brevii cupreum*, *O. Florence*, *O. Dora*, *Sophro-Laelio Cattleya Lutetia*, and the interesting *Wilsonara insignis*, with mauve flowers.

Messrs. Floy and Black, Orchid Nursery, Slough, showed a variety of interesting hybrids from their establishment at Slough, taken over from Messrs. Jas. Veitch and Sons. They obtained ten Awards of Merit for *Brasso-Cattleya Mars var. xantholeuca*, a perfect, large cream-white flower with cowslip yellow centre; *Cattleya Alexandra*, and *C. Rhoda Langley* variety, one of the darkest of the cross between *C. Iris* and *C. Hardyana*; *C. Naidia* var. *luminosa*, *Laelio-Cattleya Soudange*, *L.-C. Lorna*, *L.-C. Verdun*, *Odontioda Irene* var. *Gloria*, *O. Gratryae* Byndir variety and *O. Prince Albert*.

Messrs. Sander and Sons, St. Albans, in *Cattleya Thebes* (*Adula* s. *Dowiana*), for which they obtained a First-class Certificate on October 24, showed one of the handsomest yellow-petalled *Cattleyas* of the year, its rich ruby red labellum contrasting effectively with the other segments. Messrs. Sander also received Awards of Merit for *Brasso-Cattleya Orion* var. *Majestic*, a large cream-white flower tinged with rose; *Miltonia John Barker*, an attractive flower of unrecorded derivation; and *Cattleya Fabia Memoria* Lord Roberts, fine in form and rich in colour. Messrs. J. and A. McBean, Cooksbridge, obtained Awards of Merit for *Cattleya chionosis alba*, a pure white form; *Cymbidium Alexanderianum*, and *C. A. Excelsior*, two of the best which their numerous *Cymbidium* crosses have produced; *Odontoglossum amabile* McBean's variety, and *O. crispum* Aldworth, which was one of the attractions at the Chelsea Show.

Messrs. Stuart Low and Co., Jarvisbrook, Sussex, obtained Awards of Merit for *Brasso-Cattleya Home Low's* variety and *Cattleya Per cybalina grandiflora*, the latter one of the largest forms of the species and of good shape and colour.

The following new or rare Orchids were illustrated in the e pages during 1916:

- Brasso-Laelio-Cattleya The Baroness Orchidist variety, December 9, p. 235.
- Cattleya illustris, September 30, p. 153.
- Cyrtopetalum Rothschildianum, October 13, p. 139.
- Coleogyne corymbosa at Colesborne, March 18, p. 159.
- Cymbidium Parishii Sanderae, June 10, p. 307.

- Cypripedium Fairricanum from seed, December 9, p. 276.
 Cypripedium Thalia Mrs. F. Wellesley, June 10, p. 309.
 Dendrobium glomeratum, August 26, p. 97.
 Dendrobium Victoria Regina, May 20, p. 267.
 Dendrobium Wollastonii, April 15, p. 206.
 Dendrobium Sanderæ, October 7, p. 163.
 Disa Blackii Langley variety, August 5, p. 65.
 Disa grandiflora and parts, December 2, p. 270.
 Disa longicornu, December 2, p. 266.
 Disa racemosa, December 2, p. 271.
 Disa sagittalis, December 9, p. 285.
 Disa tripetaloides, December 9, p. 284.
 Disa Veitchii, December 2, p. 269.

VEGETABLES.

ONIONS.

ONIONS succeed in the same beds for several seasons in succession, and without the ground being dug. After the crop has been harvested rake up and burn all rubbish immediately and sprinkle the ground with lime. During the next three or four months feed the ground lavishly with slops from the house, garden, cess-pools, and pisties. This should be done until the end of February, then rake the rubbish from the surface and apply another dressing of lime. I prefer to sow the seed under glass in February, and transplant the seedlings into

manures. The ground having been treated as recommended will be rich in nitrogen, and will absorb and retain the ammonia for the use of the plants during their season. Sprinklings of a mixture of soot and wood ash between the rows occasionally will be beneficial. Should other manure be deemed necessary, give it in a liquid state. Transplanting is a great help in warding off attacks of the Onion maggot, but the practical gardener of to-day cannot afford to ignore the old saying, "prevention is better than cure." Therefore use a preventive from the start, and thus save time, labour, and expense. Quassa extract, to which has been added a small wineglass of paraffin to the gallon, is a good specific for the maggot. I have also great faith in clear soot water. *M. S. A., B.E.F., France.*

GLOBE ARTICHOKE.

I was surprised to read Mr. James' directions for growing Globe Artichokes (*Gard. Chron.*, Vol. LX., p. 219). In Scotland, in high inland districts, where the winters are certainly not mild, these plants were always grown without protection (I speak of gardens 550 feet above sea level), but the preparation of the ground is very thorough. For each plant a hole 3 feet by 3 feet deep is dug, material for drainage placed at the bottom, and the hole filled with good manure and leaf mould incorporated with the local staple, in which the Artichokes are planted, and these last for years without renewal.

However, this is not a time to plant such an extravagant vegetable, when the space required might be much more profitably planted with quick-growing crops—by so doing two crops could be taken from the same ground in the year. *Western Wight.*

DISEASE OF POTATOS.

A VERY valuable bulletin of the disease of the Potato known as *Spongospora subterranea* records the results of experiments made in America, and should be studied by all in this country who are interested in Potato growing.

This disease (corky scab), well known in the British Isles, has, as is the case here, a fairly definite geographical distribution in America.

By transferring infected soil to districts in which the disease is unknown the authors have shown that the absence of the disease in certain regions is due to climatic conditions which interfere with and prevent infection. Their observations lead them to conclude that infection is confined to those regions in which periods of rainfall, followed by cool, damp, cloudy weather occur during the growing season. They find, moreover, that certain types of soil are more readily productive of infection than others. The disease is not confined to the tuber, but occurs in the root system, and is manifest therein by numerous galls.

In addition to the Potato no fewer than seven other species of *Solanum* (including the Tomato) are susceptible to the disease, and when infected show root galls similar to those which occur on infected Potatos.

Treatment of "seed" by formaldehyde or by mercuric chloride reduces the amount of disease, and the reduction is greatest when the seed is steeped in hot solutions for a short time, e.g., formaldehyde, 2 parts to 30 of water, at a temperature of 46°-50° C. for 5 minutes, or mercuric chloride, 4 parts to 15 of water, at 44°-45° C. for 5 minutes.

Variety tests indicate that some kinds are less susceptible than others; among the more resistant is Eldorado, but it is not claimed that any varieties are wholly immune. The fungus which causes the disease is widespread in in-

FIG. 1.—LABILLARDIERE'S PLATE OF *OLEARIA STELLULATA* (*ASTER STELLULATUS*, O. LABILL.).

This plant has never been in cultivation, but several species have been grown under the name *O. stellulata*. Two-thirds natural size. (See p. 5.)

- Laelia Flaviviona, January 15, p. 53.
 Masdevallia deorsis, March 18, p. 154.
 Miltonia Frank Reader, June 3, p. 295.
 Orchis foliosa at Warley Place, November 4, p. 221.
 Odontioda Joan Fowler's variety, March 11, p. 149.
 Pleione yunnanensis, March 18, p. 161.
 Odontoglossum ardentissimum Memoria J. Gunney Fowler, May 27, p. 232.
 Odontoglossum crispum Leonard Perfect, June 10, p. 311.
 Odontoglossum The Czar, March 11, p. 150.
 Sophro-Cattleya Rex Orchidhurst variety, April 1, p. 137.
 Wilsonara insignis, June 10, p. 312.

(To be concluded.)

boxes, or place four around the edge of a 60-sized pot and plunge the latter in a hotbed. The chief dangers to avoid at this stage are cold draughts and an excess of water. Grow the seedlings close to the roof-glass to prevent their being drawn, and let the air circulate about them freely. Gradually harden the plants, and stand them outside on an ash bottom, under the shelter of a wall, for a few days before planting them in their permanent quarters. Before this operation is commenced give the ground a sprinkling of soot, and lightly rake it beneath the surface. Plant at a distance of 4 to 6 inches apart. As the bulbs begin to swell, water the roots pretty freely in dry weather, but on no account begin feeding them with strong nitrogenous

* *Spongospora subterranea* and *Phoma tuberosa* on the Irish Potato." By Messrs. Melhus, Rosenbaum and Schultz. *Journ. Agric. Research*, VII., 5, Dept. of Agric., Washington.

fected soils, and may persist for five years. No treatment has so far been discovered which rids the soil of the disease-producing organism, but sulphur, broadcasted at the rate of 600 lb. per acre, reduces the amount of infection by Spongospora.

WASTEFUL WAYS OF COOKING POTATOS.

USEFUL advice, particularly applicable to the present time, is contained in Special Leaflet No. 67* on Economy in Using Potatos. Having regard to the fact that less than 25 per cent. of a Potato is food and more than 75 per cent. water, it is specially important to make the most of the food substances contained in the tuber.

If pared, put into cold water and boiled, a large proportion of the flesh-forming constituents of Potatos is lost. On the other hand, boiling or steaming them in their jackets preserves nearly all the nutriment of Potatos. Baking also, if it be done slowly, results in the retention of the food substances.

OLEARIA GUNNIANA AND ITS ALLIES.

For a considerable time confusion has been prevalent in gardens regarding the correct nomenclature of various species of *Olearia*, which have been grown under the names *Olearia Gunniana*, *O. stellulata*, and *O. lyrata*. It has never been quite clear which particular forms should bear these names respectively, so at Mr. Bean's instigation the writer has undertaken an investigation of the taxonomy of this group of species, the results of which are set out in the following notes.

It may be remarked that the confusion at the present day in regard to the names of many garden plants, and Australian plants in particular, is often due to the excessive reduction or "lumping," if we may use a popular term, of species by certain authors. This is a constant source of trouble and delay to both horticulturalists and taxonomists, for the unravelling of the species can only be satisfactorily accomplished by the examination of actual types and of all specimens quoted, the latter, mostly preserved in various herbaria, not being always easy of access.

The species dealt with in the present paper are included by Bentham in the *Flora Australiensis*, Vol. III., p. 473, under the name *Olearia stellulata*, which, as the writer has endeavoured to show in the following lines, is a rather obvious example of an aggregate species. To be quite clear it will be as well to set out Bentham's treatment of this species as it stands in the *Flora*, which is as follows:—

"*Olearia stellulata*, DC., *Prodr.*, v., 272, with the following synonymy: "*Aster stellulatus*, Labill., *Pl. Nov. Holl.*, ii., 50, t. 156; *Eurybia fulvida*, Cass. [in *Dict. Sci. Nat.* xvi., 47]; *Hook. l., Fl. Tasm.*, i., 175; *Diplostephium stellulatum*, Nees, *Gen. et Sp. Aster.*, 187; *Aster phlogopappus*, Labill., *Pl. Nov. Holl.*, ii., 49, t. 195; *A. phlogotrichus*, Spreng., *Syst.*, iii., 525; *Eurybia quercifolia*, Cas. [in *Dict. Sci. Nat.*, xvi., 47]; *Diplostephium phlogotrichum*, Nees, *Gen. et Sp. Aster.*, 186; *Olearia phlogopappa*, DC., *Prodr.*, v., 272; *Eurybia Gunniana*, DC., *Prodr.*, v., 268; *Hook. l., Fl. Tasm.*, i., 175; *E. subrepanda*, DC., l.c."

Following the geographical distribution of the species, "Queensland, N.S. Wales, Victoria, and Tasmania," there are descriptions of three varieties with their synonymy as follows:—(1) "var. *canescens*;" (2) var. *lirata*—*Aster liratus*, Sims, *Bot. Mag.*, t. 1509; *Diplostephium lyratum*, Nees, *Gen. et Sp. Aster.*, 188; *Eurybia lirata*, DC., *Prodr.*, v., 267; *Hook. l., Fl. Tasm.*, i., 175, t. 45; and (3) var. *quercifolia*—*Aster quercifolia*, DC., *Prodr.*, v., 272; *Eurybia rugosa*, F. Muell. ex Archer in *Journ. Linn. Soc.*, v., 22."

From the above somewhat formidable array of synonymy it will be seen that the specific name *stellulatus* was first used by Labillardiere, and is the original of De Candolle's *Olearia stellulata*. Labillardiere gives an ample description and an excellent figure of his plant, a specimen of which is preserved in the Natural History Museum, South Kensington. A photograph of the illustration is reproduced in fig. 1, with the permission of the Director of the Royal Botanic Gardens, Kew, and a drawing of a typical leaf is shown in diagram (see fig. 3 (1)). It is a very different species from *Olearia Gunniana*, *Hook. l.*, of which a photograph of a typical specimen (dried) is here given, and a drawing of a typical leaf (see fig. 3 (8)). There are numerous specimens of *O. stellulata* in the Kew Herbarium, but no cultivated ones, and it seems certain that this species is not, and never has been, in cultivation in this country. The next synonym quoted by Bentham is *Eurybia fulvida*, Cass., but as this was merely a new name proposed by Cassini, with no apparent reason, for *Aster stellulatus*, Labill., it may be passed without further comment. As may be noted, Cassini's name was also used by Sir Joseph Hooker in his *Flora of Tasmania*, where the species were much more critically dealt with than in the *Flora Australiensis*. *Diplostephium stellulatum*, Nees, is only Labillardiere's plant under a different generic name. *Aster phlogopappus*, Labill., is again well-described and figured by Labillardiere, and is, I consider, a form of *Olearia Gunniana*, *Hook. l.* Sprengel preferred the name *A. phlogotrichus*, which accounts for the next synonymy. *Eurybia quercifolia*, Cass., is a new name for *Aster quercifolia*, Labill., another alteration of name for no apparent reason. *Diplostephium phlogotrichum*, Nees, and *Olearia phlogopappa* are merely other combinations for the respective species mentioned above. Then we have *Eurybia Gunniana*, DC., the description of which was founded on plants collected by Gunn and forwarded by Lindley to De Candolle. And the last name quoted by Bentham is *Eurybia subrepanda*, DC., another species described in De Candolle's *Prodrum*.

In the above synonymy of *O. stellulata*, as defined by Bentham, the writer considers that there are at least three distinct species of *Olearia* represented, *O. stellulata*, DC., *O. Gunniana*, *Hook. l. (Bot. Mag.*, t. 4638), and *O. subrepanda*, *Hutchinson (comb. nov.)*; whilst under the varieties there are perhaps four others, *O. canescens*, *Hutchinson (n. sp.)*, *O. lyrata*, *Hutchinson (n. comb.)*, *O. quercifolia*, DC. (non Cass.), and *O. rugosa*, *Hutchinson (comb. nov.)*. *O. canescens*, *O. quercifolia*, and *O. rugosa* are very distinct species indeed; the last two have separate geographical distribution, *O. quercifolia* being confined to New South Wales and *O. rugosa* to Victoria.

In order to establish the identity of the typical form of *O. Gunniana*, it was necessary to consult the Lindley Herbarium, and the writer is much indebted to Prof. Soward for the loan to Kew of the necessary type specimens from Cambridge. In the Lindley Herbarium, as at Kew, there are several different forms labelled *O. Gunniana*, but it is comparatively easy to fix upon the one described by De Candolle. He described the leaves as being toothed, about 1 1/4 inches long, and the pedicels (peduncles) long and slender. A photograph of what the writer takes to be typical *O. Gunniana* in the Kew Herbarium is here reproduced (see fig. 2), and it will be seen to correspond very well with De Candolle's description. If it be compared with the photograph of Labillardiere's figure of typical *O. stellulata*, the mistake of associating the two species will be evident. In the *Flora of Tasmania* Sir J. D. Hooker dealt very critically with the Tasmanian forms of *Olearia* (*Eurybia*) *Gunniana*, and he described no less than eight varieties. As only two of

these, var. *cana* and var. *lirata*, appear to be in cultivation, the remainder are dealt with in the systematic account given below. "Var. *cana*" is identical with *Eurybia subrepanda*, DC., and should for horticultural purposes be regarded as a distinct species. The leaves are much shorter and more rounded or obovate than in *O. Gunniana*, and they are nearly always densely canous-pubescent on the upper as well as the lower surface. *O. subrepanda* was grown in Veitch's nursery at Coombe Wood in 1884, and a dried specimen of one of their plants collected by Mr. G. Nicholson (No. 2915) is preserved in the Arboretum Herbarium at Kew. This may be the species figured in the *Gard. Chron.*, 1882, i., 732, fig. 113. "Var. *lirata*" is again a very distinct species, and should be known as *O. lyrata*, *Hutchinson*. It is usually extremely floriferous, with long, tapering entire leaves, the flower-heads being nearly always gathered into definite dense bunches at the ends of the lateral branchlets. *J. Hutchinson, Kew.*

(To be continued.)

TREES AND SHRUBS.

PROPAGATING SHRUBS.

OUR district is situated in the west of Cambridgeshire, about three miles from the sea. The climate, which is comparatively mild, cool and humid, has undoubtedly a great influence on the growth of the plants of which I am writing. I have found that there it is possible to propagate nearly all shrubs, with the exception of some of the Ericaceae, on an open border under a north wall. This border is 10 feet wide, and is sheltered from the east and west winds to some extent; very little sun reaches the border except in the morning and evening about the end of June.

In preparing the soil for the cuttings I placed a drain 2 feet deep by the edge of the border near the path, and then had the border double dug, taking care to make the subsoil more open by adding burnt earth and mortar rubble to the bottom of each trench. The surface soil was improved after the double digging by dressing it with large quantities of leaf mould and weathered coal ashes, and I think it is these ashes that have caused the development of such an abundance of roots as the rooted cuttings have. The double digging is only done about every three years, but the dressings of leaf mould and ashes are given each year. The work commences as soon as the previous year's rooted cuttings have been lifted, generally the last week in October; the border is dug over and allowed to settle before planting the cuttings about mid-November.

We generally prepare the cuttings during wet weather and heel them in until the soil is dry enough for planting. When preparing the cuttings we select well ripened wood and use strong shoots with two-year-old wood if procurable. With many species a heel to the base of the cuttings is made by pulling them off at a joint; this heel is of great importance, especially with plants having pith, such as *Roses*. Before planting, another dressing of weathered coal ashes is given to the surface of the border, which is then trodden down firmly. These ashes work in with the cuttings and encourage rooting. The cuttings are planted in short rows 1 foot apart, with the cuttings 6 inches apart and 4 inches deep. A bright, clean working spade is better than a dibber for this operation. As the work proceeds the cuttings are made quite firm by treading upon either side of the row, after which the surface of the soil is made loose with a Dutch hoe.

It is necessary to examine the cuttings from time to time, especially after frosty and stormy weather, and to tread them in firmly again, the final firming being done at the end of March. No other attention is necessary except the frequent hoeing and staking of the climbing *Roses*

* See *Journal of Board of Agric.*, XXIII., 3.

and such plants as *Buddleias*, and by the end of October the plants may be fitted for transferring to nursery beds.

It is surprising how rapidly the young plants develop while in the cutting bed, making, in the case of *Veronicas* and other similar plants, quite well formed bushes in the one season. The shrubs rooted in pots and wintered in cold frames cannot be compared with those rooted outside, and I find that we can get a much larger percentage of strikes of such plants as *Choisya ternata* and *Viburnum Tinus* in the open, and that the plants grow away freely and make shapely specimens.

By the way of further experiment I planted at the beginning of April last year a duplicate set of cuttings, the result being that there was a very good percentage of rooted plants, but their growth was not so strong.

It is necessary for me to warn readers as to the ashes they use for opening the soil when preparing the border. Stakehole ashes from coke are of no use; in fact, they may be harmful in binding the soil; and in the case of coal ashes they should be well weathered and contain no fine dust, which might cement together. If sand is used it should be quite sharp and clean, free from any binding substances such as iron or fine clay.

The following are some of the shrubs I have successfully rooted in the open. All the cuttings were taken from plants growing in the open:—*Atriplex Halimius*, *Aucuba japonica* var., *Azara microphylla*, *Berberis japonica* and other species, *Buddleia speciosa*, *Buxus*, *Cassia fulvida*, *Ceanothus*, *Choisya ternata*, *Cistus*, *Coronilla Emerus*, *C. glauca*, *Desfontainia spinosa*, *Eucalyptus*, *Fuchsia corallina*, *F. Riccartonii*, *Griselinia*, *Hydrangea hortensis*, *H. paniculata*, *Laurus nobilis*, *Lavandula*, *Leycesteria*, *Muehlenbeckia*, *Olearia Haastii*, *O. stellata*, *Ozothamnus rosarinifolius*, *Rhodotypos*, *Rosmarinus*, *Silya fruticosa*, *Skimmia*, *Spiraea arguta*, *S. media* (confusa), *Tamarix*, *Tecarium*, *Veronica Anderssonii*, *V. buxifolia*, *V. nummulariaefolia*, *V. salicifolia* and vars., *V. Traversii*, many garden varieties of *Veronicas*, and *Rambling Polyantha*, *Wickströma*, and *H.P. Roses*. *A. D. Turner*.

GARRYA ELIPTICA

This handsome Californian evergreen shrub (see *Gard. Chron.*, Vol. LX., pp. 254, 272) is much harder than is generally supposed, and training it formally against a wall robs it of every chance of showing its beauty. In Sir Harry Veitch's garden at East Burdham Park a fine group of *Garrya*—both male and female forms, I believe—occupies a position on the lawn near the house, where, judging by the size of the plants, they must have stood for many years. Near my old home at Hampton Hill a couple of trees in a lady's garden reaching 8 feet or 9 feet high had a lateral spread of at least 20 feet. On a slightly raised bank, and only separated from the road by a low palisade wall, they were in full view of all who passed by, and looked beautiful when laden with catkins. The site faced north-east, and the only protection the plants had was a thin screen of young *Sycamores* in a garden on the opposite side of the road. The only thing they suffered from during a score of years was a jolting gardener's pruning saw. A heavy snowstorm one winter bore them down, and the gardener, seizing the opportunity, sent in word to his mistress that they were "broken down and would never recover. Should he prune them?" In this way sanction—reluctantly given—was obtained. Within an hour or two they were sawn off at about 2 feet from the ground. Owing to the exceptional size of the wood, I secured a piece and placed it before the Floral Committee of the R.H.S. at the old Drill Hall many years ago. The circumstances of its growth interested the late Mr. Nicholson, and the piece of stem eventually found its way to Kew Gardens. *E. H. Jenkins*.

The Week's Work.

FRUITS UNDER GLASS.

By JAMES HUBSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton, W.

FORCING.—In writing of this department I shall not only mention such fruits as are now popular, but endeavour also to encourage the culture of others which might be advantageously grown. The absence in most gardens of the Pineapple nowadays is to be regretted. I have had nearly

twenty-five years' experience with this fruit, but now it seems almost superfluous to touch upon it. The growth of the Banana, too, has dropped out for the same reason, namely, that imported fruit has improved in quality.

Head gardeners have great responsibilities to bear in the present crisis, and that of fruit culture under glass is one of the most difficult with the very great shortage of labour. Fruit forcing, as we understood it before the war, no longer obtains in many gardens, yet it should not be entirely set on one side, for if this is done there will, in all probability, be an excess of fruit later in the season. What may be done in this direction is to give a rest to such as the first early vines and Figs, Peaches, and Nectarines. If any of these fruits show a tendency to exhaustion let them have a complete rest for one season. Let the vines be allowed to make more growth, not entirely to grow wild, but growth that will encourage increased root development. If it be possible give attention at the same time to the borders by top-dressing them with fresh loam and old mortar rubble, or its equivalent. Well-rotted farmyard manure would also be an excellent top-dressing. If any vines are still unpruned they should be treated at once.

LATE GRAPES.—The latest Grapes, such as the last of the crop of Muscat of Alexandria and the crop of Lady Downes and Gros Colman should now be cut and bottled, then placed in a dry, dark room where a minimum temperature of 45° can be maintained. Let the pruning of the vines be then proceeded with, and if there be any tendency towards bleeding dress the wounds with styptic. Take the earliest opportunity to remove any loose bark and then scrub the rods with warm water; water at a temperature of 150° will kill many of the insect pests and do no harm whatever to the vines. Next apply a dressing of such an insecticide as Liquid Gishurstine, or similar well-proved preparation. The object of following this dressing immediately upon the hot water is that it will have greater penetrating power. At the same time thoroughly cleanse the interior of each house and water all inside borders freely.

PEACHES AND NECTARINES.—In the case of these fruits take the first opportunity that may arise to thin out any exhausted wood. That is, in other words, lay in the wood thinner than usual, and give a rest to those trees that have been forced severely for some years past. In the case of these fruits do not employ the water solut for dressing the wood as in vines or Figs. Watch the trees narrowly, and keep the houses

close, or nearly so, as soon as the first symptoms of activity are seen in the flower buds.

FIGS.—In the case of trained trees that are still resting, a good opportunity may be afforded of resting them longer than usual, and somewhat severe pruning may in some cases be commendable. Follow out the same routine as advised for vines, but do not add any nitrogenous manure to the borders, for this would encourage excessive growth.

VINE AND FIG PROPAGATION.—If it be desired to raise vines from eyes this spring no time should be lost in preparing a gentle hotbed of fermenting material for the purpose. Avoid extremes of temperature, and err rather on the side of a dry atmosphere than of an excess of moisture. It is better to insert each eye in a thumb-pot than to pit several into a pan. With respect to Figs more may be accomplished by propagating a few plants every spring and growing them quickly when once rooted, than is usually done in private gardens. The Fig will luxuriate in a temperature that is congenial to the Melon. Figs now propagated in this manner will yield a few fruits by next September, and a good crop in pots the following year. I use the tips of the shoots—well ripened, of course—for this purpose, and make the cuttings about 3 inches in length. A good half dozen varieties for this purpose are Brown Turkey, White Marselles, Negro Largo, Bourjassotte Grise, Grosse Violette de Bordeaux and Violette Sepor.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

"MALMAISON CARNATIONS."—The best results with these charming flowers are obtained when the plants are kept practically dormant during winter. This is brought about by keeping them dry at the roots and in a comparatively cool house. Only sufficient fire heat is necessary to

keep the atmosphere from getting too damp, and to maintain a temperature of about 40°. Two-year-old plants should have all the growths neatly staked, using thin bamboo points, of the same shade of colour as the Carnation foliage. Pick off all decayed foliage, and lightly

stir the surface soil if it is becoming caked. If the rust fungus is prevalent, pick off all affected leaves and burn them. This operation makes the plants look shabby for the time being, but they quickly recover when growth recommences in spring. I am not in favour of spray specifics being used at this season of the year. The best preventive of rust is to keep the plants cool, and in a dry atmosphere, strictly avoiding a warm, close atmosphere. Young plants layered last autumn, if not already in their flowering pots, should be potted during the present month, for if they are left too long in small pots they are apt to become stunted, and incapable of growing away freely when potted. The first requisite is good drainage, and the potting compost may consist mainly of sweet turfy loam, pulled up roughly, with some charcoal, fine rubble, and sharp sand added, and a 6-inch potful of soot, or Carnation manure, to each barrowful of compost. Pot firmly and water sparingly until the plants are growing freely.

CINERARIAS.—The early plants are now developing their flower-spikes. When in this stage, and the pots full of roots, the plants must on no account suffer from lack of water, or the foliage will lose its freshness and colour, and the flower-

spikes become stunted. Give regular waterings with weak manure or soft-water, and occasional pinches of a good artificial plant food. The day temperatures should range between 45° and 50°, allowing the heat to drop to about 40° on cold nights. A high temperature for Cinerarias is harmful, and tends to encourage the spread of green fly and other insects. Fumigate the frame as often as necessary to keep the plants clean. Late batches of Cinerarias in frames can be kept cooler, admitting air daily in suitable weather.

HERBACEOUS CALCEOLARIAS.—These slow plants succeed under conditions similar to those given to Cinerarias. Two important points are never to allow the plants to suffer a check through becoming pot-bound in their early stages, and to avoid high temperatures. Shift the plants into larger pots as they require it, using a rich open soil. Stand the plants, if possible, on a damp bottom.

CLEANING PLANT HOUSES.—All plant houses should be thoroughly overhauled and cleaned during the winter months. Wash all glass and woodwork, both inside and out, limewash all walls under stages, and do any necessary repairs. Wash the fine gravel, or renew the material used on the stages, and see that all plants are clean before being brought in.

THE FLOWER GARDEN.

By W. J. GUNSE, Gardener to Mrs. DENESTER, Keele Hall, Staffordshire.

SHRUBBERIES.—The unfavourable weather has greatly delayed all work in the flower garden. Where the soil is very wet planting should be discontinued for a time, but every opportunity should be taken directly it is in a suitable condition to complete the work of planting deciduous trees and shrubs.

The plants in the shrubbery should be trimmed and regulated, using the knife freely on the common evergreens, especially where they are encroaching on choicer plants. A light forking of the soil is necessary directly the planting is finished, incorporating fallen leaves with the soil as the work proceeds. Vacant spaces in the back of shrubberies may be filled with surplus herbaceous plants. For these the ground should be trenched and liberally manured, removing old tree roots or stumps. Where flowers are grown in the foreground of shrubberies, the roots of the shrubs and trees quickly impoverish the soil, which should be trenched every year, or enriched with an abundance of manure, leaf-mould or old potting soil, and the opportunity taken to restrict the roots of the trees and shrubs. All rubbish collected should be burned and the ash distributed over the border.

DIGGING FLOWER BEDS.—It is not advisable to bring very heavy, retentive soil to the surface, especially where annuals are to be sown. In such cases take out a trench 12 inches deep and 3 feet wide. The bottom of the trench should be well broken up to a similar depth, mixing with it a quantity of sand, ashes, leaf-mould or decayed vegetable refuse. Next year the soil may be trenched 2 feet deep. The surface should be left as rough as possible until planting time.

SEEDS.—Home-saved seeds and any that remain from last season should be tested to ascertain their germinating qualities. Simplify the bedding schemes as much as possible, and use Antirrhinum, Larkspurs, Lupins, Lavateras, Godetias, Clarkias and Statice freely instead of the usual tender plants.

THE KITCHEN GARDEN.

By J. DESS, Foreman, Royal Gardens, Windsor.

EARLY PEAS.—A sowing of some hardy variety of Pea may be made as soon as the soil is sufficiently dry, on a warm south border which has been trenched and manured in early winter. Sow the seeds in shallow trenches, cover with 2 inches of fine soil, and keep a careful watch for mice and other pests.

EARLY CARROTS IN PITS.—A sowing of Carrots should be made with as little delay as possible, on a gentle hotbed made up in a brick pit; the hotbed may be trodden lightly together so that they may produce a mild and lasting warmth in the soil. Spread the soil over the bed to the depth of 3 inches. When it has become sufficiently warm and dry it should be made moderately firm with a wood rake. Sow the seeds carefully and cover lightly with fine soil. The surface of the bed should be lightly damped on fine days and the pit kept closed until the young plants appear through the surface, after which ventilation should be carefully given to keep them from becoming drawn.

LETUCES. A sowing of Lettuce seed should be made at once in boxes or pans, which may be placed in gentle heat until germination takes place. When the plants are well through the surface they may be removed to cooler quarters within a few inches of the glass and gradually hardened, so that they may be planted in cool pits as soon as large enough to handle. Golden Ball, Tom Thumb and May King are good varieties.

BROAD BEANS.—The Bean requires a good rich soil, and may be sown as soon as the ground is in suitable condition in a sheltered spot; sow in drills 3 feet apart and 3 inches deep. Broad Windsor and Beck's Dwarf Gem are suitable.

CALIFLOWERS. Plants raised in September should be freely ventilated during mild weather, and watered as often as necessary. On sunny days the lights should be removed from the pit. Any plants remaining in the seed bed should be potted up at once into 4-inch pots, and if the stock of autumn-grown Cauliflowers is short a sowing of some early variety should be made without delay. If placed in gentle heat until they are through the surface, and pricked off when large enough to handle, the seedlings should be ready for planting on a warm border early in April. Select such varieties as Magnum Bonum and Great Dane.

FRENCH BEANS. A sowing of Dwarf Beans should be made in 7-inch pots, and from this sowing pots should be ready to gather in six or seven weeks from the date the seeds are sown. Crook the pots carefully, and use a compost of two-thirds turfy loam and one-third rough leaf soil. Fill the pots three-parts full and leave the remaining space for earthing-up the plants when 6 inches high. A temperature of 65° with plenty of atmospheric moisture will suit them well. The Belfast and Osborn's Fencing are good varieties.

TOMATOS.—Make a sowing of some approved variety of Tomato to produce plants for fruiting in May. Sow the seeds thinly in pans of sifted soil and place in a temperature of 70°. As soon as the seedlings are large enough to handle they must be carefully potted into thumb-pots and placed near the glass in the same house until they become established, after which they may be removed to cooler quarters and ventilated to keep them stocky. These plants

should be potted as soon as ready, and never allowed to become stunted for want of root room. Tomato plants raised from seed in October intended to fruit in April should now be making good progress in 6-inch pots. Keep them as near the roof glass as possible.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. F. Davey Abbotts, Wood, Godalming, Surrey.

PLANTING OPERATIONS.—The weather has not been congenial for fruit tree planting recently, but with open weather any arrears can be got on with as soon as possible—especially so on light soil. The soil in this particular district is very light in texture, and after rain or frost has cleared for a few hours the ground can be easily worked. Any trees that have recently arrived from the nursery or other sources should be well covered with some frost-proof material, or laid in a trench and covered with soil. During inclement weather there are many things that can be done, such as preparing stakes, labels, and soils for planting. The mixing of soils cannot be done too thoroughly, especially those which contain manures. Draining operations can be pushed along, even in frosty weather. In heavy soils draining is requisite for the more tender fruits, such as Peaches, Nectarines, Apricots and Cherries. The drainage may consist of a good supply of rubble under each tree, or by putting in 2½-in. drain pipes; but if the land is drained the former plan is as practical as it is simple and effective. Many young fruit trees have been ruined through being planted in sour, waterlogged soil.

PROPAGATING. It is not too late to put in cuttings of Gooseberries and Currants, and it is always as well to have a small stock of these in order to fill gaps, or make new plantations, or to give away to the employees on the estate. Select straight shoots, or prunings, and rub away the basal eyes, or buds, and insert the cuttings about 6 inches apart in a trench chopped out about 6 to 8 inches deep. If a little lime rubble is at hand, a sprinkling after it has been passed through a 4-inch sieve can with advantage be sown along the bottom of the trenches. Be careful to propagate from clean and healthy bushes, and select only such varieties as do consistently well in the particular locality. Tread the cuttings in very firmly. The firmer they can be made the better will be the results.

ORCHARD TREES.—Orchards containing old trees can be attended to as opportunity occurs. Though it is difficult to obtain much labour this season, some of the old, well-pruned hands are still available, and with proper supervision are capable of good and useful work. The trees can be thinned and the centres opened up, which makes Apple and Pear gathering easier and quicker. Cut out all thin and weak wood; aim at taking all cross or crooked growth away, and all dead wood or decaying wood. If there is much dead wood the trees should be grubbed, and more profitable trees planted. Varieties which are not good or marketable should be headed back for grafting with good varieties in the season. This system is one which should commend itself to every grower, small or large, especially if the tree be vigorous and healthy. Prepare washes for fruit trees that require it, and on fine, still days, distribute them with a fine sprayer.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41 Wellington Street, Covent Garden, W.C.

Editors and Publisher Our correspondents would do well to obtain answers to their communications and save as much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to editorial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unasked communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41 Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 37.9°.

ACTUAL TEMPERATURE:—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, January 4 (10.0 a.m.): Bar, 29.4"; temp., 48°. Weather—Sunny.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—Spring-flowering Bulls, Fruit Trees, Rhododendrons, etc., by Prothero and Morris, at 67.68, Cheapside, E.C., at 12 o'clock.

THURSDAY—Standard, Dwarf, and Climbing Roses, by Prothero and Morris, at 67.68, Cheapside, at 1 o'clock.

The Leaf Glands of Peaches.

The leaf glands of Peaches have been recognised for just over one hundred years, but it is curious that the name of their discoverer should be almost forgotten and apparently unknown to most writers who have dealt with this matter.

Like many other horticultural advances, we owe the recognition of these glands to an amateur, M. Desprez, a judge at Alençon, whose appointment in 1810 as deputy of the Corps Législatif brought him to Paris. The gardens of the Luxembourg were then a large nursery; and it was here that M. Desprez spent his spare moments studying the large collection of fruit trees, and here that he made his interesting discovery. It is remarkable that in the accurate and minute descriptions of fruits which had been made by previous French authors, no mention is found of these structures; but, once pointed out, their diagnostic value was recognised, and soon became the basis of all classifications of Peaches and Nectarines. As is well known to most gardeners, the glands are of two types, round and kidney shaped, and a re-

markable correlation exists between the presence of glands and the detailed structure of the leaf. Glandless leaves always have serrate margins, while those with glands have crenate margins.

The first paper of importance calling attention to these structures in this country was that of John Robertson on "The Classification of Peaches and Nectarines," published in the *Transactions of the Royal Horticultural Society*. Lindley, in a later paper in the same publication, made the glands or their absence the basis of a classification. In 1867 E. A. Carrière published a new system of classification, in which he pointed out the presence of intermediate types which are now generally recognised as "round to kidney shaped." The study of these characters had so far been entirely limited to their value as identification marks, and no careful study had been made as to their physiological characters and development. This, however, has now been rectified by a recent paper by Mr. C. T. Gregory,* in which pomologists and botanists alike will find points of interest. As in most detailed studies of this nature, we find that the rough distinction between "kidney" and "round" loses its desirable sharpness under close investigation. In the drawings of types which the author gives there are many that would puzzle an expert to class either in one division or the other, and it would seem possible to establish several clear types both of "kidney" and "round."

It is interesting to note that in the large number of varieties examined no serrated-leaved forms were found with glands, thus confirming previous observations. On the physiological side the author shows that the glands are modified leaf-spines, and after the secretory process is finished the upper part of the gland gradually disintegrates with the production of a corky layer which slowly extends downwards, so that in some cases it becomes entirely decomposed.

Peaches and Nectarines offer a fascinating problem to the student of genetics. The presence and absence of the glands, the large and small flowers, the reported susceptibility of the glanded varieties to Peach leaf blister and the glandless to mil-ew, present material for study of the greatest possible interest.

OUR ALMANAC.—The next issue of the *Gardeners' Chronicle* will include a sheet almanac for 1917 containing particulars of horticultural appointments up to the time of printing.

FOOD PRODUCTION IN SCOTLAND.—The Marquis of BREADALBANE, in a letter to the *Scottsman*, has described the success of his experiments in vegetable culture in his gardens at Taymouth Castle, which had been left almost without men in response to the calls to the Colours. By means of a Canadian plough—the Cocksbut—the land was double ploughed, with highly satisfactory results. The City of Edinburgh is taking up the question of allotments with great vigour, and an effort is being made to cultivate as much

land as possible in the parks, etc. Meetings are being held in different districts in the city, and Mr. J. W. M'HATIE, the City Gardener, has given addresses on the subject of allotments and vegetable growing. In Dundee the matter has also been under consideration, and a proposal to crop a large extent of land is likely to be adopted.

MINISTRY OF FOOD APPOINTMENT.—Captain CHARLES BATHURST, M.P., has, on becoming Parliamentary Secretary to the Ministry of Food, relinquished the post of Organiser of the Land Settlement Scheme for Ex-Service Men, which he has held under the Board of Agriculture and Fisheries in an honorary capacity for the last eight months. The duties have been taken over by Sir RICHARD WINFREY, M.P., Parliamentary Secretary to the Board of Agriculture and Fisheries.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The voting papers for the election of pensioners to this institution have just been issued. There are sixty-four candidates, and it is proposed to elect eighteen. The difference in these figures shows the increased amount of support required to enable the institution to relieve the necessitous cases that constantly arise amongst gardeners and gardeners' widows, for, it may be pointed out, the cases included in the list have all engaged the attention of the Committee, and each is recommended equally to the sympathies of the electors. The official notice of the meeting is as follows: The seventy-seventh annual general meeting of the members and subscribers of this Institution will be held at "Simpson's," 101, Strand, London, on Tuesday, January 23, 1917, at 2.45 p.m., for the purpose of receiving the report of the Committee and the accounts of the Institution (as audited) for the year 1916, electing officers for the year 1917, and for the election of eighteen annuitants on the funds. The chair will be taken by Sir HARRY J. VEITCH, treasurer and chairman of committee, at 2.45 o'clock. The poll will be open at 3 o'clock and close at 4 o'clock precisely, after which hour no voting papers can be received.

THE LATE MR. N. N. SHERWOOD.—The gross value of the estate of the late Mr. N. N. SHERWOOD, of the firm of HURST AND SONS, Houndsditch, and Prosted Hall, Kelvedon, Essex, has been returned at £514,949. Deceased left sums of £500 each to the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund.

BEQUEST.—Mr. WILLIAM HESLITINE MUDFORD, formerly Editor and manager of the *Standard*, who died in August last, left to his gardener a sum of £1,500, and his guns, telescopes, etc.

ACORNS AND CHESTNUTS FROM VERDUN.—It will be remembered that Lord FRENCH, when at Verdun, gathered from the battlefields Sweet Chestnuts for planting in his garden, to form an avenue as a souvenir of the glorious city. Others having expressed a wish to obtain seeds for the same purpose, the Deputy Mayor of Verdun has forwarded a consignment of both Chestnuts and Acorns to the London and North-Western Railway Company, and the seeds will be sold in aid of the War Seal Foundation (L. and N.W.R. Section), which aims at providing cherry homus for L. and N.W.R. servants who may be totally disabled in the war.

MANGANESE AS A FERTILISER.—The divergence of opinion with respect to the value of manganese salts in effecting increased crop production appears to be explained by the results of recent experiments* by Messrs. SKINNER and REID. These authors find that whereas manganese, applied as manganese sulphate at the rate of 50 lb. per acre, is without beneficial

* *The Taxonomic Value and Structure of Peach Leaf Glands*, C. T. Gregory. Cornell University, Bulletin 365.

* *The Action of Manganese under Acid and Neutral Soil Conditions*. Bull. 141, U.S. Dept. of Agric., Washington.

effect on acid (sour) soils, it produces a markedly beneficial effect on those soils after their acidity has been neutralised by liming. Wheat, Rye, Beans, Maize and Cow Peas all give higher yields when the soil rendered alkaline by lime was treated with manganese sulphate.

A DEVICE FOR SENDING POLLEN BY POST.—In the course of a valuable account of his work in breeding the Sugar Cane in Madras Dr. BARBER, Government Sugar Cane Expert, mentions that a successful way of sending pollen by post is to enclose it in small gelatine capsules. This method, which we do not remember to have been described before, should be useful to plant-breeders generally.

MOROCCO.—The *Board of Trade Journal* states that H.M. Agent and Consul-General at Tangier (Mr. H. E. WHITE, C.M.G.) reports, under date November 27, that the Resident-General of the French Zone of Morocco has issued an Order appointing a Commission to study the question of colonisation and to suggest the best means of encouraging the settlement of colonists who will develop the agricultural riches of that region. It appears from the local press that steps are being taken by the Director-General of Agriculture for the grant of Maghzen (*i.e.*, State) land in small lots for the purpose of market gardening and in larger tracts for general agricultural purposes. An agricultural irrigation service has been formed for the purpose of scheduling the hydraulic resources of the country and at the same time of aiding colonists with technical advice on the irrigation of their lands.

AGRICULTURAL APPOINTMENTS.—The Right Hon. R. E. PROTHRO, M.P., President of the Board of Agriculture and Fisheries, has appointed Mr. A. W. MOSKOW to be his Private Secretary, and Mr. A. BARRETT to be his Assistant Private Secretary (unpaid).

THE "GARDENERS' MAGAZINE." We deeply regret to learn from a note published in the last issue of the *Gardeners' Magazine* that this journal has decided to suspend publication during the period of the war.

CALYX-SPLITTING IN CARNATIONS. The careful work carried out at the New Jersey Experiment Station* does not add very materially to our knowledge of the causes which bring about the splitting of the calyx in Carnations. Numerous countings of normal and split Pink Erecht reze show that whereas the former has an average of sixty-four petals, in the latter the number of petals ranges from 70 to 108, averaging about 84. Periods of dull, sunless weather increase the amount of splitting in flowers opening about a month after these periods, and hence it is to be inferred that lack of light during bud formation is one of the causes of splitting. The constitution of the plant also counts—for manifestly a flower which produces a mass of petals too great for the capacity of the calyx is bound to split. This is well shown when White Perfection and Matchless are compared. The former has a slender calyx and a relatively large number of petals; in the latter the calyx is large in relation to the number of petals which it contains. Perfection often splits, whereas Matchless grown at the New Jersey Experiment Station only 5 per cent. splits.

GASSING THE "PRICKLY PEAR" IN QUEENSLAND.—Opuntias, or "Prickly Pears," as they are popularly called, are a great pest to growers in Queensland, and various methods have been adopted to destroy the plants. After many months' experiments, the treatment of certain species of Opuntias with arsenic trichloride in a gaseous form has been proved to be effective, while the problem of manufacturing the trichloride in large quantities has also been successfully overcome

Trichloride is now obtainable in large quantities at a cost of £22 per ton. The place selected in Queensland for the experimental work was Delacca. This district contained some of the worst "Pear" growth in Queensland, ranging from 7 feet to 8 feet high, and of such a dense, impenetrable nature as to make spraying impossible. Areas that had been gassed some twelve months ago are entirely free from the pest. The gas is applied by means of an atomiser. Gassing is done with the best results after heavy dews or rainfall. The trichloride apparently has no effect upon other vegetation, because of their lower water contents, neither is there any danger in regard to stock.

FARMYARD MANURE.—Dr. RUSSELL estimates* that the amount of farmyard manure used

—The H.E. of the National Horticultural Society of France in the Rue de Grenelle, Paris, is a common meeting place of gardeners and nurserymen on leave from the Front. We learn that M. GUSTAVE CLAMANT was there a few days ago, probably on the usual leave to celebrate his being decorated, as announced in our issue of the 23rd ult.

—The current number of *l'Horticulture Française*, just to hand, contains the eighth list of honours, in which the names of French horticulturists who have fallen on the field of battle appear. Fifteen names are given, but they are practically unknown to English readers. The list of citations from Army Orders is headed by the name of Captain BALLET. In addition to previous honours, Captain BALLET has now received from

FIG. 2. OLEARIA GENIANA, TYPE FROM A DRIED SPECIMEN. (See p. 3)

annually in this country is 37 million tons, which, at 5s. a load, represents a yearly value of 9½ million pounds sterling. The value of artificial manures used annually is considerably less than this sum, probably not more than 6½ million pounds sterling.

WAR ITEMS.—We regret to learn that M. GEORGES TRÉFÉRET, of Versailles, is home on sick leave. He has many friends in England who will join us in expressing the hope that he may speedily be restored to health.

—Lieut. HENRI NONIN is undergoing treatment for his shattered right arm at the Hospital of the Grand Palais. Meantime, he is engaged as interpreter at the Statistical branch of the Labour Bureau.

the hands of the General commanding his division the Cross of the Legion of Honour.

Sergeant F. A. DONNER, formerly traveller for Messrs. JOSHUA BENTLEY, Ltd., Barrow-on-Humber, was recently found dead in a dug-out in the British lines. Sergeant DONNER went through the South African war; he enlisted again as a volunteer 23 months ago, and spent the first war winter in the trenches in Flanders. Later he was invalided home. He took part in the Loos offensive.

GERMINATION OF GRASS SEED.—The attention of those who have to carry out germination tests of grass seeds is directed to an article* on the effect of light on germination. Tests

* See *Florists' Exchange*, December 2, 1916.

* Presidential address, Agriculture, Ent. Assoc., 1916.

* *Agric. News*, Imp. Dept. of Agric. West Indies, XV.

carried out at the Agricultural Experiment Station, Minnesota, show that germination is better if a sunlight germinator is used. For some species light is essential. Furthermore, a change of temperature from 20° C. to 30° C. (20° C. for 18 hours and 30° C. for six hours) gives better results than are obtained by exposure of the seeds to a constant temperature of 20° C.

DESTRUCTION OF FLY LARVAE IN HORSE MANURE.—Messrs. COOK and HUTCHINSON have continued their investigations on the destruction of fly larvae—previously reported in these pages—and conclude that fly larvae may be destroyed by treating the manure heap with two-thirds of a pound of borax in 10 gallons of water. This amount suffices for 3 bushels of manure. Inasmuch as large quantities of borax have an adverse effect on plant growth, they recommend, where the manure is to be applied to the land, that powdered Hellebore be used instead of borax. For 8 bushels of manure half a pound of Hellebore mixed with 10 gallons of water makes an effective larvicide. Experiments made with a mixture of calcium cyanamid, acid phosphate and kainit—all of which substances have, of course, value as fertilisers—indicate that the larvae may also be destroyed by these substances.

A LETTER ON LAND TILLAGE PUBLISHED SEVENTY YEARS AGO.—A wealthy old farmer, who had for some time declined in health, perceiving that he had not many days to live, called his sons to his bedside. "My dear children," said the dying man, "I leave it with you as my last injunction not to part with the farm, which has now been in our family these three hundred years. For to disclose to you a secret which I received from my father, there is a treasure hid somewhere in the ground, though I never could discover the particular spot where it is concealed. However, as soon as the harvest is got in, spare no pains in the search, and I am well assured you will not lose your labour." The wise old man was laid in his grave, and no sooner had the time mentioned arrived than his sons went to work, and with great vigour and alacrity turned up again and again every foot of ground belonging to their farm; and the consequence was, that although they did not find the object of their pursuit, their lands yielded a far more plentiful crop than those of their neighbours. At the end of the year, when they were settling their accounts and computing their extraordinary profits, "I would venture a wager," said one of the brothers, "that this was the concealed wealth my father meant." How full of meaning, and how applicable at the present time, is the advice given in this fable, which I have quoted at length. The various reports of improvements which you give in your paper, and which are published elsewhere, all concur in showing that the land does contain a valuable treasure—that its resources are in fact unbounded. Look, for instance, at the report of Mr. MERRI's proceedings at Tiptree. He has diligently sought for the hidden treasure. He first removes the water which obstructs his search, and then he ploughs deeply, peradventure the share may reveal it. What is the result? The same that the fable discloses—an increased produce. The land, which was acknowledged to be some of the poorest in the country (the purchase money confirms this), now bears crops equal to the very best the country affords. He, it is true, has not found a bag of gold; but he has found wealth in an increase of crops. But this is not all; he is not the only one who finds or shares in the treasure—there are many sons. Ask his labourers. Look, again, at Earl DRETT's proceedings at Whitfield Farm. Poor land, whose treasures were lying hid under a load of water and neglect, has revealed its capabilities on being drained, subsoiled, and properly cultivated, and anyone acquainted with

the neighbourhood on walking over that farm and seeing the crops, must testify that the surrounding land has only to be similarly treated and an equal reward would await the treasure-seeker there. Look, again, at Sir JAMES GRAHAM's report in the 1st Vol. of *Agricultural Society's Journal*; he, it seems, has also inherited and acted up to the advice in the fable, for we find that land which was let at 4s. 6d. per acre has, after a search which cost him £6 18s. 4d., been re-let on a lease of fourteen years at 20s. These—at least, the two first—have no doubt not individually received the amount of treasure they were entitled to, as the expense of the search has absorbed the greater part of their share; but it must be remembered that they were pioneers, not so much looking to their own advantage as clearing the road for those who were to follow; therefore, all honour be to them. They had to search in the dark, and yet have not been disappointed. They have found where the treasure lies, or rather, the obstructions to be removed before we can grasp it, and our search is thus rendered comparatively easy; besides, the cost of removing these obstructions is now reduced at least one-half. Seeing, then, that there is a treasure in our farms, and that our father "Corn-Law," from whom we long received protection, is on his death bed, seeing that necessity is therefore now laid on us to work for ourselves, let us with vigour and alacrity drain, plough deep, and subsoil plough, turn up again and again every foot of ground, avail ourselves of the experience of those who have searched before us, and we shall not be disappointed. *T. C. M., Manchester, in "Gard. Chron.," January 9, 1847.*

WORCESTER CHRYSANTHEMUM SHOW.—The committee of the Worcester Chrysanthemum Society has forwarded the sum of £90, being the profits from the Society's exhibition in 1916, to the Worcester General Infirmary. The amount realised in 1915 was £60 (for Red Cross Funds), and in 1914 £37 10s. (for War Relief Fund), making a total of £187 10s.

NOTICES OF BOOKS.

"ANNUALS AND BIENNIALS."

In these days there is not much need to commend annuals and biennials for garden decoration. We err, probably, in limiting too much the number grown, and in confining the species to comparatively few. Yet a slight consideration will show that to a very large extent gardeners avail themselves of plants propagated annually from seeds. So much is this the case that the division of everyday plants into annuals, biennials, and perennials, has lost much of its sharpness, and to talk of growing perennials as annuals has become current in gardening speech. The authoress of this manual has recognised these facts, and while limiting—too strictly, as we think—the true annuals and biennials, she has included several perennials, though here, too, restriction is strikingly apparent. It is surely an oversight that plants so easy to produce from seeds and so indispensable as Legumes, Carnations, Lobelias of the *Cardinalis* type, *L. ramosa*, *Lychnis*, *Cornucopia*, *Lupinus polyphyllus*, hybrid *Delphiniums*, many *Primulas*, *Scabiosa caucasica*, *Lathyrus sativus*, *Cranthemum annuum*, the *Celsias*, annual *Calceolarias*, *Silene Armeria*, *Chelone barbata*, *Crocus grandiflora*, *Humea elegans*, *Verbena*

venosa and *Virginian Stocks* should have been excluded. None of these takes more than two years to produce flowering plants—the majority one year. A perusal of the volume reveals but very few slips. One, however, is that of assuming *Gilia coronopifolia* to be a recent introduction, whereas it was described and illustrated, though badly, by Billenius in 1732 by the name of "Quamoclit pennatum, erectum, floribus in thyrsum digestis."

Though the volume extends to about 170 pages, only some 80 contain letterpress; the rest are illustrations, and may provide a reason why the chapters on various aspects of gardening with these plants are so brief and the lists for various purposes so condensed. Mr. Jenkins contributes a chapter on raising annuals under glass and notes on the Sweet Pea. *B. P. R.*

"BRITISH-GROWN TIMBER AND TIMBER TREES."

This work by Mr. Angus D. Webster directs attention to various kinds of timbers produced in the British Isles, giving, in many instances, indications of the present value of such timbers and the uses to which they are put. The work is well illustrated by some fifty three photographs of woods. About fifty species are dealt with, and in the case of the more important ones a short description of the tree is followed by notes on its culture, average size, age at which the tree matures, appearance and quality of the timber, uses to which the wood may be applied, and its present price. Unfortunately, the number of really first-rate kinds of timber trees in the British Isles is comparatively small, for although numerous trees that produce excellent timber in other parts of the world are hardy here and grow into fine ornamental trees, they are never likely to be of commercial value from a timber standpoint. Sufficient notice does not appear to have been taken of this fact by Mr. Webster, for he has included many species that it would not pay to grow under silvicultural conditions, and the timber of which could not be procured in quantity were it required, his excuse for their inclusion resting on the fact that a few ornamental specimens blown down or removed during alterations have been accepted by a timber merchant. Almond, Albatus, *Cotoneaster frigidula*, Lilac and *Paulownia* are cases in point. Several specimens of *Catalpa bignonioides* are said to have been sold lately in London in company with other home-grown woods at 2s. per cubic foot, and apparently as an inducement for the extended cultivation of this tree we are told that "Professor Sargent says that the *Catalpa* offers peculiar advantages for economic planting, the timber being of excellent quality and known to have stood as fence posts for seventy five years and to be perfectly sound." As an ornamental tree for town or country, *Catalpa bignonioides* is excellent, but its value as a timber tree in this country is very problematical, whilst in America the Western *Catalpa* (*C. speciosa*), a larger-growing tree, is much more useful. There are few places in the British Isles where plantations of that species would be likely to give really good results. *Paulownia imperialis* may be dismissed at once as a possible timber tree for this country, as it is decidedly tender. On the contrary, the Tulip tree (*Liriodendron tulipifera*) is not mentioned by Mr. Webster, although it is one of the most promising of exotic broad-leaved trees for forest planting in the Midlands and South of England. It matures here at from ninety to 120 years of age, forming a tree in the open 80 to 110 feet high with a trunk diameter up to 3½ feet, producing excellent wood equal in quality to that imported from N. America. Mr. Webster has been unfortunate in his experiences of the timber of *Pinus Pinaster*, but the species ought not to be condemned altogether by reason of the quality of its timber for certain purposes, for it is an excellent species for planting on sand dunes in the South and West, and

of considerable economic importance in Western France for the production of turpentine. Moreover, many hundreds of thousands of tons of topped trunks are received annually in South Wales from Western France for use as pit-props. Why not put the tree to similar use here?

Except for a too free use of capitals in specific names, the scientific names throughout the work are fairly correct, the worst mistake, perhaps, occurring on page 106, where the common Spruce (*Picea excelsa*) appears as Spruce Fir (*Abies excelsa*). The combination of Spruce and Fir ought to be dropped everywhere, for it only tends to confuse generic names. W. D.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

OLD SEED AND PLANT CATALOGUES (see *Gard. Chron.*, Vol. LX., pp. 299, 309).—Mr. W. Roberts's literary contributions to the *Gardeners' Chronicle* are always brimful of interest. His reference to the popular florists' flowers of the thirties and forties and to the places round the metropolis where they were grown revives many memories. I have often wondered where the site of Maddock's famous nursery at Walworth, near London, is to be found. To-day Walworth is a densely crowded locality, and the place is undiscoverable. Mr. Roberts refers to Groom of "Wandsworth," the Tulip grower of great repute. Groom may have removed to Wandsworth, a famous place in its day for nurseries, but, speaking from memory, I think Groom was Maddock's successor at Walworth. The site of Chandler's nursery at Vauxhall is perpetuated by Camellia Street. The reference made to the Dahlia as a popular flower eighty years ago reminds me of many hours devoted to that subject. It is a very absorbing one to those interested in what may be termed the antiquarian aspects of floriculture, but the names of the Dahlia growers who issued catalogues and referred to by Mr. Roberts do not include some of the most eminent. I suggest by way of addition Mr. Dennis, of King's Road, Chelsea; Messrs. Whitely, Brames and Milne, of Fulham; Mr. Pamplin, of Wandsworth Road; Mr. Michael Brewer, jun., of Cambridge; Mr. Appleby, florist, Doncaster; Mr. Widnall, of Grantchester, Cambridge; Mr. Gaines, of Battersea. To these may be added the names of several whose Dahlia catalogues are reproduced in the *Annual Dahlia Register, 1856*, viz., Mr. Edward Bartlett, of New Bond Street, Bath; Mr. J. Bates, of Oxford; Messrs. T. C. and E. Brown, of Slough; Mr. Geo. Glenny, of Isleworth; Messrs. W. Heale and Son, of Calne, Wilts; Mr. Henry Skilman, of Marlborough, Wilts; Mr. Geo. Wheeler, of Warminster, Wilts. Even this addition does not include all the numerous dealers and raisers of the flower that was at that time called the "King of Autumn." C. H. P.

THE VALUE OF INTERCROPPING (see p. 307).—I do not agree with Mr. Bagg in his advice to plant Lettuces between Tripoli Onions. I plant these Onions in rows 10 to 12 inches apart, and they do well; if Lettuces were set between the Onions, the latter would be all neck and exposed to damage in planting and gathering the Lettuces. With regard to cropping Cabbage, Cauliflower and Turnips between Strawberries, our Strawberries are planted 2 to 2½ feet between the rows, and we do not get sufficient sun, as a rule, to ripen the berries; how would they ripen with these tall crops between? Lettuce and Spinach may succeed in new plantations of Strawberries. The method advised by Mr. John Bates, to grow Strawberries as annuals is a good one, but I would allow 18 inches between the rows to have room for placing the litter to protect the fruit, and also for gathering it. With regard to Mr. Bagg's advice to plant Dwarf Beans between Peas and Runner Beans, how far are we to plant the Peas and Runner Beans apart to get Dwarf Beans to succeed between them? During the past season our Dwarf Beans were not satisfactory planted in the front of greenhouses and under south walls; what results are we to expect if we adopt Mr. Bagg's method? I am keen on

intercropping, and desire to obtain as much as possible from the land while the war lasts, but if we put in one crop to spoil another, where does the economy come in? The practical gardener may be of great service to many during the present shortage of food by advising and instructing amateurs and allotment-holders on how to cultivate the land and crop it to the best advantage. This can only be done by a man on the spot who is well acquainted with the soil and situation. *Thos. B. Archer, The Hazels Gardens, Prescot, Lancs.*

TREATMENT OF STRAWBERRY BEDS (see pp. 279 and 312).—I suspect that most of us who have grown Strawberries largely will agree with Mr. J. A. Paice in that spring is the best time to apply mulchings to established beds, and this particularly applies to light soils, but ways

and the flavour left nothing to be desired. *L. C. Bottell.*

THE ORIGIN OF THE LOGANBERRY.—The Loganberry has for so long been accepted as a fertile hybrid, and its intermediate position between the Blackberry and Raspberry sections of the genus is so apparent, that the doubt expressed as to its origin by Mr. W. O. Backhouse (see p. 280) causes some surprise. The doubt seems to be largely based upon the small amount of segregation among the seedlings, but this is not necessarily conclusive, for Mendel, in his original essay, gave examples of hybrids that propagate themselves as truly from seed as pure species, and showed that one of them had been followed up to the tenth generation. Some evidence, however, is now given as to the occurrence of the Loganberry in a wild state, which sug-

(See p. 3.)

and means have to be considered in gardens at the present time more than ever before, and I imagine it better to make sure of the mulching during the winter than to run the risk of not being able to get the work done at the approved season. Besides this, wheeling the manure can be done with much greater labour economy during frosty weather, and for this reason it has been the general rule in gardens to transfer as much manure during frosts as possible. My experience with late Strawberries has been contrary to the generally accepted views on manuring, for I have found that a sprinkling of sulphate of ammonia—2 lb. per square rod—immediately the flowers are pollinated has greatly improved the crop. This has been especially noticeable with Waterloo and Frogmore Late Profite. There was a smaller percentage of "blind" flowers, the fruits were larger and of greatly improved colour,

gests a possible earlier history; unless, indeed, it is an escape from cultivation. More than one writer suggests that it may be a true species (one of them adds, "of comparatively recent origin"—whatever that may mean), but this is not borne out by either its history or characters. The origin of the Loganberry from self-sown seeds of the Auchinbough Blackberry has already been mentioned. It was supposed that the other parent was a Raspberry of the Red Antwerp type, which grew near, and it was originally remarked: "The Loganberry shows so clearly the mingling of both types that no horticulturist who studies the fruit has doubted that it is a true hybrid. . . . and shows in texture, in the easy slipping from the core, and partly in flavour, the Raspberry parentage." The free drupe is a character of the whole *Ilex* section of the genus, while in *Eubatus* the receptacle breaks away with the

dripes attached. In the Loganberry there is a curious compromise, for the top of the elongated receptacle breaks off and comes away with the dripes, leaving part of the core behind. The Anglinbaugh Blackberry is said to be a remote alle sport of the native *Rubus vitifolius*, which was found growing wild on the sandy peninsula of Alameda, California, by a pioneer, Anglinbaugh, who removed it to his garden and cultivated and disseminated it. He died in poverty, but his berry preserves his name from oblivion. It is described as "a beautiful vine, of trailing habit, like a Dewberry, but with much larger, darker leaves, and of extremely vigorous growth. Being pistillate, it does not bear well unless planted with other varieties. Properly fertilised, on good soil, and well trained on a fence or trellis, its bearing powers are often astonishing, and in quality it is very fine." The significance of the pistillate character will be seen presently. *Rubus vitifolius* is regarded by Focke as a variety of *R. ursinus*, a very variable species, which he isolates in a small subsection on account of its dioecious character, the stamens and pistils being borne on different plants. *R. ursinus* has been described as variable in growth, in leaves, and in many other particulars, and in rich, sheltered places it occasionally bears so heavily that people come for miles to camp in the berry fields and gather the delicious fruit. The fruits are described as oblong, sweet, and highly flavoured. There are ample dried materials of *R. ursinus* and var. *vitifolius* at Kew, but I find no wild specimens at all approaching the Loganberry. There are garden specimens, and so far as I can see their hybrid nature is borne out by comparison. This takes us back to the Anglinbaugh, and it is quite clear that unless there were staminate plants in or near Judge Logan's garden all the flowers fertilised would produce hybrids, which almost demonstrates the hybrid origin of the Loganberry. And only by hybridisation could a plant between the two sections of the genus be obtained, though whether the pollen parent has been correctly interpreted is more open to question, for it is said that "Raspberries of several sorts grew alongside, and, in fact, intermingled." Any doubt felt by the writer is chiefly due to the well-known acidity of the Loganberry, unless indeed that comes from the other parent. Confirmatory evidence of the hybrid nature of the Loganberry may be found in the fact that artificial hybrids have been obtained between Raspberries and Blackberries having its essential characters. It should likewise be an easy matter for anyone who has the Anglinbaugh to test the question. All that would be necessary would be to cut a few berries in bags (to prevent contamination) and pollinate them with the Red Antwerp, or an allied Raspberry. As the flowers are pistillate there would be no stamens to be first removed. If the Loganberries mentioned are not exactly their identity, we assume, is not in doubt, it would seem to be an independent and possibly real origin, in which case there would be a question whether the parentage has been correctly interpreted, and this would in turn involve the origin of the seedling found in Judge Logan's garden. This uncertainty makes it the more desirable that the experiment suggested should be carried out. It would also be interesting to secure dried materials of the wild plants mentioned. *R. F. Eloff*.

THE PLANTING OF IRISES.—After considerable experimenting, it has been my practice for the last two or three years to transplant Irises so far as possible during the first week in August, or thereabouts. Besides the unripeness of the rhizomes in June, I have been influenced by the supposition that at this time (immediately after the flowering) the embryo buds of the flower spikes for the following season were being formed, as is the case with Daffodils. These embryo buds are fully formed by September, and are visible to the naked eye, and do not appear to increase appreciably from then on to the end of the year. If this supposition is correct, since this period of embryo bud formation is, according to De Vries, one of extreme sensibility, it would largely account for the deficiency of the flower spikes of the June-planted Irises in the experiment, and it would be of interest to make a further trial between March and August plantings. But even if the March-planted Irises should

give more flower-spikes than August-planted, I think that August planting would still be preferable for the reasons Mr. Dykes gives, especially on account of the greater prevalence of adverse weather and soil conditions in March. My ground being open and exposed, March (or April) planted Irises have always suffered conspicuously, and have subsequently been more liable to disease. The drying off of the rhizomes when they are out of the ground for some time between taking up and replanting in August, though it causes loss of flower-spikes, appears to have a very good effect in checking the Iris disease. Out of the whole lot (900) replanted one year only one plant was found slightly attacked the following season. Though Irises are making roots throughout the season from spring on into autumn, it seems to me that they root intermittently rather than strictly continuously, being in this respect somewhat similar to *Potentilla Narciss*. Whatever may be the case with the original species, with these garden hybrids it appears to depend chiefly on the weather. During dry weather there is, if not an actual resting period, a pause or slackening in root formation, and as August is the driest month (drier than either July or September), it would seem also for this reason the best time for replanting. Since the number of the flowering spikes in the following seasons has been chosen as a test of comparison, it will be useful to note that though the time the rhizomes are out of the ground, even when pruned, does not injure the health of the plants in the least when they are replanted in August, it has a very direct effect on the flowering in the following season. At one planting (about 600 plants), when the plants were about a week out of the ground, only about one-quarter to one-third flowered. Another year the plants (about 900) were from a fortnight to three weeks or more out of the ground, and only about a dozen flowered, though the plants were strong and exceptionally healthy. Last year I transplanted a dozen plants, replanting them immediately, and all flowered freely this year, some even more freely than the duplicate plants left undisturbed. Since plants sent out by nurserymen must necessarily be out of the ground some time, I think it would be of interest, if the experiment made at Wisley can be repeated comparing the results of March planting with early August (instead of June) planting, to make it in duplicate, one lot of plants being replanted at once, and the other lot after an interval of a week or ten days. *J. J. Bliss*.

SOCIETIES.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

DECEMBER 21.—*Committee present*: The Rev. J. Crombelloholme (in the chair), Messrs R. Ashworth, A. G. Ellwood, P. Foster, A. R. Handley, J. Lupton, D. McLeod, W. Shackleton, S. Swift, H. Thorp, and H. Arthur (secretary).

AWARDS.

FIRST-CLASS CERTIFICATES

Laelo-Cattleya Anable var. Ashlandior (L. C. Escamilleux *albans* × *C. Warscewiczii Stanley*), a large flower with white sepals and petals and well-marked lip, from T. ASHWORTH, Esq.
Cypripedium Methen (*Gaston Butler* × *Euryopsis*), a flower of reddish-crimson colour; the dorsal sepal is very flat, from T. WARBURTON, Esq.

AWARDS OF MERIT.

Cypripedium Nigger (Mrs. Carey Batten × *Berkhoutii*), *C. Loretus* (*Cinnia Harfield Hall* × *Levanum Chibberghamum*); *Odontoglossum hadatum* var. *Amplexicium* (*ardantissimum* × *Waldenianum*), *O. crispum* var. *Red Monarch*, all from P. SMITH, Esq.
O. crispum var. *Madam Lavee*, from Mr. W. SHACKLETON.

CULTURAL CERTIFICATE.

To Mr. C. BRANCH (to, to W. R. Lee, Esq.), for a plant of *Odontoglossum crispum Annamit*, carrying a spike of 17 fine flowers.

LINNEAN.

DECEMBER 14. Sir David Prain, C.M.G., F.R.S., President, in the chair.

Mr. H. S. HOLDEN communicated and explained a paper by Miss Isabel McClatchie, B.Sc., entitled "Observations on the Root-System of *Impatiens Roylei*, Walp."

The primary root-system of *Impatiens Roylei* consists of a somewhat short tap root, a whorl of four robust lateral roots, and a number of accessory laterals. These soon become obsolete and are replaced by a large superficial root-system of adventitious origin derived from the lower half of the hypocotyl. In plants in which the first and subsequent nodes trail along the ground, additional roots are produced from these. Abortive roots commonly arise at the bases of lateral branches, and further development can be induced also in these by suitable manipulation. Various other factors, such as wounding, increasing the height of the soil, &c., also induce accessory root-formation. The primary root-system is characterised by a 4-arch or 5-arch solid xylem star, and by the early development of tyloses. The stout adventitious roots are poly-arch with a wide pith, and develop a superficial protective cork layer. They show, in common with the other parts of the plant, the tannin sacs and raphides characteristic of the genus.

Dr. ETHEL N. THOMAS communicated a paper "On the Distribution of Monococious Plants, and the Occurrence of Hermaphrodite Flowers in *Myrica Gale*, with Observations on Variations of Sex," by Miss A. J. Davey, M.Sc., and Miss M. Gibson, B.Sc., which was explained by the authors.

Myrica Gale, the common Bog Myrtle, is described as being typically dioecious, but mention has been made by several authors of the occasional occurrence of the monococious condition.

Observations during several successive years on a large area of *Myrica* in the peat moors of Somerset show that there is always a small proportion of monococious plants, which present all gradations between the normal pistillate and staminate types. Further, it has been found that the sex of a plant may vary from year to year.

The monococious plants may be grouped as follows:—

(a) Plants bearing both staminate and pistillate catkins of the normal type. These occur on different shoots, or they may be mixed on the same shoot. In the latter case, usually the lower part of the shoot is staminate and the upper part pistillate, but the reverse order may obtain. Staminate, pistillate, and mixed shoots may occur on the same plant, and the proportions of each vary considerably.

(b) Plants bearing androgynous catkins. Such catkins usually contain stamens below and pistils above, but the reverse arrangement is found also.

(c) Plants whose catkins consist of hermaphrodite flowers. These flowers (like the unisexual flowers) occur singly in the axils of the catkin scales. Each flower consists of a central ovary, surrounded by three or four stamens (less commonly two). Just below the insertion of these on the short floral axis, there are two small outgrowths, corresponding to the "bracteoles" or normal pistillate flowers. The pistillate flower consists of an ovary flanked by two "bracteoles" adnate to it, which enlarge and persist in the fruiting stage; the staminate flower consists of a group of stamens (commonly four), without bracteoles.

The hermaphrodite flowers are protogynous. They produce normal fruits, and their stamens are functional.

VARIATIONS OF SEX.—Among plants or shoots marked and examined in successive years, some showed progressive change from pistillate to staminate during several seasons; e.g., plants producing abundant fruit in 1915 showed mixed shoots in 1914, and in 1915 became almost entirely staminate. In 1916 several such cases showed indications of the reverse change.

Some plants appear to be continually fluctuating, while others remain stable for many seasons.

GENERAL BULB GROWERS' OF HAARLEM.

The following awards were made by the different Committees of the General Bulb Growers' Society of Haarlem during August, September and October, 1916:—

FIRST-CLASS CERTIFICATES.

Gladioli Flora, citron-yellow; *Insubide* (decorative), yellow and old gold; *Dahlia Parthus* (decorative), silvery-lilac and purple.

AWARDS OF MERIT.

Gladioli Chris, velvety-red, veined wine-red; *Corry*, light heliotrope, spotted sulphur-yellow; *General de Wit*, soft peach bloom; *Ulmus passable*, flesh colour, shaded apricot; *King of the Blues*, bluish-violet; *Muste Water*, purple; *Mr. Johan Spoor*, canary yellow; *Pride of Haarlem*, rosy-carmine; *Pride of Holland*, orange-scarlet, spotted white; *Amalinde Annette*, yellow, shaded apricot; *primulina Scarlett*, reddish-orange, shaded red; *Mrs. Gradlewans*, canary yellow; *Prosperity*, rose and carmine, shaded blue; *Parity*, white; *Rein van Knaumeland*, rose, spotted yellow; *Dahlia Barantale* (collected), dark purple, white, veined lilac; *Saats* (collected), orange and scarlet, yellow; *Samaritan* (cactus), ivory white; *Amantia* (decorative), dark amaranth; *Charles Brankovsk* (decorative), lilac and rose; *Evigne* (decorative), purple; *Frederik Badde* (decorative), silvery-lilac and white; *Joseph Roher* (decorative), ruby-red; *Nelson's Xanthin* (decorative), scarlet; *Perfection* (decorative), salmon-rose and yellow; *President Lincoln* (decorative), lilac; *President Washington* (decorative), rose and lilac; *Bois Gen* (decorative), soft rose and lilac; *Thomas Moore* (decorative), old gold and lilac; *Wainford* (decorative), white; *Creation* (Paeony-flowered), cherry-red and salmon; *Etna* (Paeony-flowered), dark scarlet; *Franz Ludwig* (Paeony-flowered), clear mauve colour; *Jhr. Barcol van Hoogland* (Paeony-flowered), yellowish apricot; *Mahony* (Paeony-flowered), dark red, shaded brown; *Merr. A. C. van Meenen* (Paeony-flowered), purplish-lilac; *Oriant* (Paeony-flowered, semi-double), yellow and scarlet; *L'ours d'Utrecht* (single), dark purple; *Vesuvius* (Paeony-flowered), orange scarlet; *Dictator* (single), orange-scarlet.

CERTIFICATE OF THE HAARLEM TRIAL GARDEN.

Dahlia Peace (decorative), white; *Autumn Chere* (decorative), amaranth, shaded violet; *Bambulet* XI. (decorative), pure yellow; *Koning Albert* (decorative), purple; *Wolfgang von Goethe* (cactus), orange shaded dark salmon; *Feronia* (cactus), violet and rose; *Mare Michal* (cactus), lilac and rose, with white centre; *Schone Hamburg* (decorative), golden yellow; *Samaritan* (cactus), ivory white; *Paul Crampel* (decorative), fiery-red; *Calixtena* (Paeony-flowered), canary yellow; *Jhr. Barcol van Hoogland* (decorative), apricot yellow; *Creation* (Paeony-flowered), cherry red and salmon; *Latum* (Paeony-flowered), yellow; *Salvator* (Paeony-flowered), carmine and rose; *Rose Gem* (decorative), soft rose and lilac; *Vesuvius* (Paeony-flowered), orange, shaded scarlet; *Sulphura* (decorative), sulphur yellow; *Red Ensign* (cactus), stone-red; *Centra* (Paeony-flowered), white and soft lilac; *E. F. Hours* (cactus), salmon rose; *White Ensign* (cactus), white; *White Pearl* (decorative), white; *Vondel* (Paeony-flowered), lilac; *President Washington* (decorative), rose and lilac; *Old Gold* (Paeony-flowered), copper yellow; *La Fichte* (Paeony-flowered), cream-white, with centre yellow; *Rosafer* (decorative), brownish-red; *Furbank* (decorative), scarlet and stone-red.

•• **NEW POSTAL RATES**—Contributors and correspondents are reminded that under the new postal rates, letters bearing a penny stamp must not weigh more than one ounce. The postal charge for letters exceeding one ounce, but not exceeding two ounces, is twopenne, and therefore at the rate of *qd.* every two ounces.

Obituary.

ANDREW BATTERS.—We regret to learn of the death, in his 42nd year, of Mr. Andrew Batters, youngest son of Mr. J. Batters, Gillingham, Norfolk. In early life he was engaged in the scholastic profession, which he abandoned some eighteen years ago for gardening, when he became assistant to his father, who was gardener to the late J. G. Kenyon, Esq., and Mrs. Kenyon, Gillingham Hall.

JOHN H. HERDMAN.—We regret to announce the death of Mr. John H. Herdman, who passed away on the 22nd ult., after a very short illness. Mr. Herdman was for over six years gardener and Orchid grower to Mr. G. Shorland Ball, Burton, Westmoreland. For a few years he was landscape foreman for Messrs. F. H. Mawson and Sons, Lancaster, and while in that position was engaged in important work in various parts of the country. Fourteen months ago Mr. Herdman was appointed head gardener at Elmick Park, Newcastle-on-Tyne, which position he held at his death. He was thirty-six years of age, and leaves a widow and two little daughters.

GEORGE SCHNEIDER.—We learn with deep regret that Mr. George Schneider died suddenly at his home, 17, Theld Road, Fulham, on Tuesday last, in his sixty-ninth year. For nearly fifty years this eminent French gardener served on his professional duties in this country, where he formed a connecting link between the gardening interests of his own country and the country of his adoption. He devoted himself to establishing and strengthening cordial relations between gardeners in the two countries, and in this connection founded the Société Française d'Horticulture de Londres, an association over which he presided until his death. Those who have attended the annual meetings of this society of French gardeners in England know that Mr. Schneider's enthusiasm and energy in the welfare of the movement were unbounded, and that he was looked upon almost as a father by the numerous members. His object was to establish an *entente cordiale* between British and French gardeners, and the good influence he exercised over the many thousands of young French gardeners who came under his notice here has borne good fruit, so that his name will long be honoured in the two countries. Schneider was connected with gardening all his life. He was born in Paris in 1843, and very early showed his aptness in his own country. After a short professional career in France he came to England in 1870, to take up an appointment with the firm of John Lang and Sons, Forest Hill. Subsequently he was employed by Messrs. Hugh Low and Co., of Clapton, and finally with Messrs. James Veitch and Sons, Chelsea, where he remained for thirty years. Many of our readers who remember the Chelsea exotic nurseries as they were a quarter of a century ago, will easily call to mind the fine collection of Ferns that Mr. Schneider had under his devoted care. His skill in cultivation was remarkable, so much so, that anyone who experienced difficulty with a newly introduced species or variety invariably sent Schneider a bit in the hope that he would discover its secret, and they were seldom disappointed. Since his retirement from Messrs. Veitch's nursery he has carried on a horticultural agency at Fulham. At one time Schneider was a frequent writer in the French and English horticultural Press, and he is the author of several excellent works, of which *The Book of House Ferns* is probably the best known. He also wrote another work on Ferns, entitled *Choix de Fernes for amateurs*, which had a wide sale. He published the *Cultivier de l'Orchidophile* in France, showing that his knowledge of plants was a wide one; indeed, he was regarded as an authority on indoor plants, and especially Ferns. Schneider's abilities and good work brought with them due reward. He was made Chevalier du Mérite Agricole in 1896, and an officer of the same Order in 1907. He was a corresponding member of the leading French and Belgian horticultural societies, and he was in the habit of adjudicating at most of the international shows in Europe.

MARKETS.

COVENT GARDEN, January 5.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate nearly from day to day, but occasionally several times in one day.—EWS.

REMARKS. Supplies of cut flowers are exceptionally low. Tulips are very scarce. A few bunches of scarlet tulips were filed off last week, but their quality was only second-rate. Chrysanthemums are almost finished, of the coloured blooms yellow and pink are the best, whilst of white varieties Mille, The Duke of Cambridge and the Duke of Devon have been blooming, and the Duke White (for sprays) are the only sorts obtainable. Carnations are still a limited supply, although their prices are easier at 5s. and 6s. per dozen. Because of Lilium longiflorum was fairly plentiful for Christmas, and New Year's trade, and their prices were not so high as was anticipated. There is a large supply of Lily of the Valley, and the prices for this flower are lower than for the other winter-flowering plants. The French flowers are very unreliable and arrival are uncertain. Several packages reached Covent Garden on Monday last after a journey of six to eight days, and some of the night was spent at the coast, so that they were practically unsaleable. No shipments from France reached the market on Tuesday last. There has been a great shortage of foliage during the past week. Adiantum Fern (Crested) and the Parisian variety are practically out of stock almost round prices.

REMARKS.—Home-grown and overseas Apples have arrived in sufficient quantity to meet all demands. The following varieties of Pears are now available: Boscain de Commerce, Easter Burrell, Glor Morden, and Keiffer. Apples, Pines and Apples are plentiful. Bananas have not been so scarce for many years past as they are today. Californian seedless Oranges are now on offer, and the supplies of Black Grapes are about equal to the demand. Muscats are not so plentiful as they have been. Forced vegetables available consist of English and French Asparagus, Channel Islands and English New Potatoes, Seakale, Mushrooms, Beans, Peas, and Cauliflowers. Forced Lettuce is not on offer. Ordinary vegetables and roots are fairly plentiful. E. H. R., Forest Garden Market, January 3, 1917.

Potatoes.

	s.d.s.d.		s.d.s.d.
Bedford	10 6-11 6	Lincoln— <i>con.</i>	s.d.s.d.
King Edward	10 6-11 6	Black Land	10 6-11 6
Arran Chief	10 6-11 6	Evergood	10 6-11 6
Lincoln	10 6-11 6	King Edward	11 0-12 0
Arran Chief	11 0-12 0	Queen	11 0-12 0

REMARKS.—Trade is still thin, and prices remain about the same as last week. Stocks in London are still small, and few tubers are being grown from the growers. E. J. Newbourn, Covent Garden and St Pancras, January 5, 1917.

DEBATING SOCIETIES.

WARGRAVE AND DISTRICT GARDENERS.—The last meeting of the winter season took place on December 20, and although the number of members was not large, there was much enthusiasm shown in the discussion which followed an interesting and practical paper on "Wall Fruit" given by Mr. J. Stephens, gardener at Calham Court, Hoxley-on-Thames. He dealt on the preparation of the soil in the borders, planting, training, pruning, tying-in, watering, feeding, disbudding, sheltering in bad weather, the enemies and pests of wall fruit trees, remedies for their eradication, and concluded with a list of these trees which do well in this district.

GARDENING APPOINTMENTS.

Mr. F. A. Hicks, as Gardener to Sir EVAN SPHERE, Blair House, Dunblow, S.E.
 Mr. Geo. W. Hagon, as Gardener to G. A. WILLS, Esq., Burwalls, Bristol, for the duration of the war.
 Mr. Geo. Martin, as Gardener to S. F. EDGE, Esq., Gallops Homestead, Ditchling, Sussex. (Thanks for 1s. for R.G.O.P. box.)
 Mr. JAC. JANTH, for the past 4 years manager in the nurseries of Messrs. JOSEPH ORR & SON, LTD., as Gardener to Colonel CODDINGTON, Oldbidge, Dog Bush.
 Mr. G. H. Grayer, as Gardener to W. W. BUCKLER, Hurst, East Highbury Park, Macclesfield.
 Mr. F. SNELL, for over 9 months Gardener to A. PHILLIP MORE, Esq., Willersey Hall, Ashby-de-la-Zouch, as Gardener to C. T. PARKER, Esq., Queen Lodge, Leightonborough, Leicestershire.
 Mr. THOMAS TINSON, until recently in service with Lord FRENCH at Nidd Hall, Harrogate, York-shire, and for 3 years previously Gardener to GREY HARBOROUGH, Esq. at Shimpling, near Beving, Berkshire, as Gardener to Mrs. NICHOLSON, Borden House, Borden, Hampshire, for the duration of the war.

SCHEDULE RECEIVED.

Royal Horticultural Society's Daffodil Show to be held on Friday, April 17, in the Drill Hall, Buckingham Gate, Westminster.

ANSWERS TO CORRESPONDENTS.

FILBERES AND CORNUTS: H. J. J., Washington, Can., In England, Filberes are not commonly grown on a large scale for market, as Cornnuts yield better and sell for higher prices. The Kentish Cob and Webb's Prize Cob are recommended. Basin-shaped trees, with stems 12 to 15 inches long, are commonly grown in Kent, where the Nut industry is considerable; but the pruning of these is very elaborate and expensive. Some growers allow the trees to keep their natural shape, with very little pruning. In that form they crop at least as well as in the artificial shape; but the Nuts are smaller. There are not nearly so many suckers from the trees of natural shape as from those trained in basin shape, to be dug up every year. Cobs should be planted 15 feet apart each way, and Gooseberries or Currants may be planted among them at 5 feet apart, to last for about ten years, or till the Cobs overshadow them. There are no satisfactory statistics as to yield, which varies enormously. We have heard of a phenomenal crop of two tons per acre, but half a ton is nearer the average from mature trees. Money returns per acre vary enormously, as do prices per lb. At present the unprocessed rates of 2s. 2d. to 2s. 4d. per lb. are quoted, as the crop in 1916 was nearly a failure and unprocessed nuts are scarce. Ordinary prices are 5d. to 6d. per lb. You should obtain "Fruit Farming for Profit," by George Bunyard, containing full directions for pruning, price 3s.,

including postage, from our publishing department.

FOXGLOVE WITH TERMINAL REGULAR FLOWER: P. J. B.—The occurrence of flower-spikes of the Foxglove bearing a terminal regular flower is by no means uncommon. The precise cause of the phenomenon is unknown, but it is due to some internal derangement of the normal growth. Plants which possess this peculiarity breed true to it. If crossed with the normal form the offspring all appear normal, though self-fertilised seed obtained from these apparently normal hybrids produces plants of which one in every four shows the abnormality. Although curious and interesting scientifically, the malformation is not a desirable acquisition in a garden.

GISHURST COMPOUND: Correspondent. For winter washing and cleansing vines use 8 ounces of Gishurst compound to 1 gallon of water.

NAMES OF FRUITS: D. H. Apples: 1, Broad End; 2, Newton Wonder; Pear: Bellissime d'Haiver.

POTATOES: Ignominous. The Potato tubers show no sign of injury by frost. You may sprout them in the greenhouse, covering them with mats, as you suggest, during times of frost. Make up the hotted with the Beech leaves, using a little stable-dung to promote fermentation. Use fresh leaves, not the leaf-mould, and make them in a heap, well trodden, about 3 feet deep. Your plan of treating the seedlings is suitable. We do not recognise the variety.

RABBITS AND FRUIT TREES: J. P. Smear gas tar very thinly on the bark of the trees not higher than 2 feet from the ground. If you apply a heavy coating of the tar the trees will suffer injury.

VEGETABLE CROPS: Hesser. You would require 5 oz. to 3½ oz. of Onion seed to sow one square rod of ground. Nine lbs. of Parsnip seed are required to sow an acre of ground, and you would require the same amount of Carrot seed. Butter Beans are eaten pods and all, and if they are kept for the winter must be lotted wet. Haricots can be grown for winter use dry. A suitable book for your purpose is *Commercial Gardening*, by John Weathers, in 4 vols., price 9s. per volume, from our publishing department.

VEGETABLE GROWING: C. J. W. The land in question, which, we take it, is old pasture, should be broken up at once by ploughing as deeply as possible, and left in this condition until the middle of February, when it should be cross ploughed and thoroughly harrowed. In the first or second week in April, drills should be ploughed to the depth of 4 or 5 inches, and the Potato sets planted, 18 inches apart in the rows, which should be made 3 feet 6 inches apart. The seed tubers should be purchased at once, and laid out thinly in a cool but frost-proof building, as extra care spent in this way will prevent immature growth and waste. King Edward is one of the best, and most popular varieties for heavy soils; failing this, Dobbie's Prolific or The Factor should be chosen. Immediately after the Potatoes are earthed up, plant a good strain of Brussels Sprouts between the rows, at 2 feet 6 inches apart. If the operations are properly carried out, there is no reason why the ground should not yield a good profit; the following season almost any vegetable crops could be grown successfully.

WILLOW FOR BATS: Lord L. The Willow that furnishes the best wood for cricket bats is known as *Salix caerulea*. It is a hybrid from the White Willow (*S. alba*) and the Crack Willow (*S. fragilis*), and can be obtained from nurseries in your own county.—Messrs. Daniels Bros., Ltd., Norwich. The hybrid is known to the trade as the Cricket Bat and Close-barked Willow, the latter term to distinguish it from one of the parents, the Open-barked or Crack Willow. A useful book is *British-grown Timber*, by A. D. Webster, just published, price 5s. 6d. post free.

Communications Received.—J. C. Richmond (Thank), will look it up.—W. W.-N. & R. G.—W. W. P. (Wine) S. L. W.—U.S.A.—H. S. T.—R. F. S., Bombay—S. L. W.—A. I.—H. L., Beaconsfield—G. M.—H. P., Froehage, S. Africa.—W. G.—J. G. B.—C. H. M.—E. M.

T. DOWN begs to thank all applicants for Head Gardener's situation which is now filled.

GLAMORGAN COUNTY COUNCIL.

Notification of the appointment of an Advertiser to the GLAMORGAN COUNTY COUNCIL invites applications for the appointment of a HORTICULTURAL DEMONSTRATOR and ADVISER for assisting the occupiers of Cottage Gardens, Allotments and Small Holdings in such areas as will, from time to time, be selected within the Administrative County of Glamorgan.

Applicants must possess an Examination Certificate of the Royal Horticultural Society, and have served as apprentices to Gardeners, and have held situations in which they were in charge of and responsible for Flower, Fruit, Vegetable, and Hot-house work.

Experiences as demonstrated in Vegetable Gardens will be deemed an additional qualification.

Applicants must provide and be able to refer to a verified copy of their work with an estimate at the rate of 25 per annum, in addition, for the upkeep of a bicycle.

The appointment will be for one year, subject to one month's notice on either side, and will be renewable annually.

The person appointed will be required to give his whole time to the service of the County.

Applications, stating previous experience and age, with copies of three recent testimonials, must be received by the Chief Education Officer, Glamorgan County Hall, Cardiff, on or before 10 a.m. on the 27th day of JANUARY, 1917.

T. MANSELL FRANKLIN
Clerk of the County Council
Glamorgan County Hall, Cardiff
13th January, 1917.

THE UNIVERSITY OF LEEDS
DEPARTMENT OF AGRICULTURE.

APPLICATIONS are invited for the position of additional INSTRUCTOR IN HORTICULTURE. Salary, £150 a year.—Applications will be received up to January 21, 1917, and should be addressed to THE SECRETARY, The University, Leeds, from whom further particulars may be obtained.

HOME-GROWN FOOD.
THE BUNTON LIME FIRMS COTTAGE GARDENS ASSOCIATION.

WANTED, a thoroughly competent MAN, to direct operations and supervise the work of wood growing in the Association.

About 1,000 allotments and about 100 acres extra for Potato land.

The man appointed must be fully qualified and possess satisfactory references.

He will be required to advise in the purchase of seeds, plants and implements, and instruct, direct, and lecture on food-growing and storing, and also on poultry and pig raising, &c., by cottagers on economic and organised lines.

Reply, stating age, experience, qualifications, and salary to

T. RYAN,
Managing Director,
The Bunton Lime Firms Co., Ltd., Buxton.

HEAD GARDENER—Wanted on May 28 next, for Bromley, HEAD GARDENER, must be thoroughly qualified in all departments pertaining to a large Garden, particularly in the cultivation and marketing of all kinds of Garden Produce, ineligible for service.—Applications, with testimonials, to CHARLES W. KALSTON, Chamberlain, Pabton Thornhill, Dumfriesshire.

HEAD GARDENER on semi-public estate, wanted in North-Western suburb; one capable of advising as to tree planting laying out and maintaining open spaces, &c., and taking entire charge of staff of Gardeners.—C. L., Box 11, 41, Wellington Street, Covent Garden, W.C.

WANTED, HEAD MAN, for good private Vegetable Garden.—Apply personally or by letter to MRS. PENTON, Lyndhurst, Hants.

WANTED.—Can any Gentleman recommend HEAD WORKING GARDENER for Orchard, near Tamworth? At present two men under him, good cottage supplied.—Write, stating full particulars and wages, to HON. W. H. GOSCHEN, 47, Cadogan Gardens, S.W.

WANTED (end of January), WORKING HEAD GARDENER, thoroughly experienced in all branches, Inside and Out.—Apply, THOS. E. LEWIS-BOWEN, Clunifew, Boncath, Pembrokeshire.

WANTED, February, experienced HEAD WORKING GARDENER (ineligible), usually 2 kept; may be single-handed during war; house, coal and vegetables found.—Write, age, family, wages, and copies of testimonials, PRESCOTT, Highlands, Woldingham.

WANTED, HEAD WORKING GARDENER, thoroughly experienced, trustworthy; Vineyard, Orchard House, Vegetables, cool Conservatory; cottage.—Write, with particulars, age, wages, experience.—E. H. BATES, Horbin, Newton Sarumville, Yeovil.

WANTED, HEAD WORKING GARDENER, experienced Inside and Out; capable and obtaining good house and usual allowances.—Apply, stating wages, when free, to GUBBINS, Swallowcliffe Park, Banbury.

WANTED, HEAD WORKING GARDENER of 4; must be over military age or ineligible and thoroughly experienced; good cottage found; state wages and full particulars.—SIR JOHN BELL, Bart., Framley, Stoke Poges, near Slough.

GARDENER (HEAD WORKING) wanted; 2 kept; 10/6 per week, 30s. week and cottage.—H. DIGMORE, Glastonbury Hall, King's Lynn.

WANTED for Cheshire, from the middle of February, a good all-round WORKING HEAD GARDENER, must be a married man and over military age; good cottage and coal supplied.—Reply, stating wages, to BOLT, SON & MAPLES, 5, Cook Street, Liverpool.

WANTED, A MAN to take charge of Vineyard and Peach-houses; wages 25s. per week and Board.—Apply, C. ALLEN, Estate Office, Worth Park, Crawley, Sussex.

WANTED, AGED MAN, to take charge of Garden; must be well up in Fruit; good wages to a suitable man.—Apply, HEAD GARDENER, Greenlands, Henley-on-Thames.

WANTED, GARDENER (SINGLE-HANDED); practically no glass; no cottage; boy kept, good wages to thoroughly reliable man.—Apply, with particulars, wages required, and past experience, R. WOOD, Flint Cottage, Box Hill, Dorking.

WANTED, good all-round SINGLE-HANDED GARDENER; ineligible since a gentleman's place; 30s. per week.—Letters, WILEY, 16, UX bridge Road, Ealing.

WANTED, good SINGLE HANDED GARDENER; regular help given; experienced in all branches, particularly Orchids, Chrysanthemums, and Carnations; cottage, coal, &c.; ineligible.—Write particulars, stating wages required, experience, and copies of references to S. SAMPTON, Prospect House, near Alfreton, Derbyshire.

GARDENER (SINGLE-HANDED), ineligible for over military age, LADY GARDENER with good experience of Vegetables, Fruit and Flowers, willing to learn the working of small electric light plant; no cottage, wages, 35s. to 40s., according to experience; at once.—Apply, ROSSENDALE, The Manor Cottage, Gutteridge Cross, Bucks.

WANTED, GARDENER (SECOND), for hot Garden, Flowers, General Work; also LAD, Proposer, Orchids, Peaches, Vines.—Apply, HEAD GARDENER, Bonshill, Presbury, near Macclesfield.

WANTED, SECOND GARDENER; either sex, to assist Head Gardener with the Inside work of Garden. Apply, with copy of testimonial and wages required, to A. HIDD, Farrant's Gardens, Bickley, Kent.

NORTH RIDING ASYLUM, YORK.
WANTED, SECOND GARDENER (INSIDE); experienced Fruit and Flowers; wages 30s. weekly, 12 o'clock Saturdays.—Apply, stating age, married or single, full particulars of experience, to THE MEDICAL SUPERINTENDENT.

UNDER GARDENER required (Second of five). State full particulars to W. A. JOHNSTONE, Kearsney Court, Dover.

WANTED, GARDENER, experienced; some help; Inside and Out; thorough knowledge; ineligible; state age, wages, and experience.—THOS. H. SOUTHON, "Gaulburn," Clungtford, Essex.

NOTES FROM A GALLOWAY GARDEN.

FEW recent papers in the *Gardeners' Chronicle* have given so much pleasure to general readers as the Notes from a Cotswold Garden, by Mr. H. J. Elwes. It is possible that some interest, were it only from the contrast in conditions of soil and climate, may be found in occasional notes from a garden in the extreme south-west of Scotland. Here, instead of the high elevation, rigorous winters, hot summers and cretaceous soil of Mr. Elwes's garden, we are within a mile of the sea, about one hundred feet above it, with a mild but blustery climate, and without a trace of lime in the soil. The mention of lime reminds me that last summer I found a characteristic limestone plant *Orchis pyramidalis* growing in pure sea sand a few yards inland from high-water mark. Being very fond of terrestrial Orchids I transplanted it to the flower garden, where it remained a long time in bloom. I have been able to find only two instances recorded of the occurrence of this species in Scotland, one near the Mull of Galloway, on the side of Luce Bay opposite to us, the other in the island of Colonsay. The geological formation of the whole district is lower Silurian sandstone with intrusive igneous rocks and overlaid with boulder clay. It appears as if the extremely minute seeds of this Orchid had been waterborne from the chalk of Antrim or the limestone of Cumberland, and that there is a sufficiency of comminuted shell in our sea sand to meet its requirements in the matter of lime. The percentage of lime, however, must be slight, for we use the same sand successfully, mixed with peat, for raising *Rhododendrons* from seed.

The winter, so far, has been remarkably mild and dripping here, no frost except two or three sharp nips which ex-

tinguished *Hydrangea hortensis*. Nevertheless, nearly everything is a week or a fortnight later in flowering as compared with former seasons, and this was the case throughout the spring, summer and autumn of 1916. For instance, *Hamamelis mollis*, now (5th January) in full beauty six and eight feet high, opened its first bloom on 23rd December, the dates in the previous five years ranging from 13th to 18th. This is undoubtedly one of the very best flowering shrubs introduced of recent years. It never fails to blossom in the utmost profusion during the dark days, and its flowers, like those of its less brilliant congener, *H. arborea*, and unlike those of *Jasminum nudiflorum*, pass unscathed even in severe frost. As both these species of Witch-hazel are often supplied as grafts on stocks of the inferior *H. virginica*, special attention should be given against undesirable suckers.

Like so many plants from Southern Chili, *Lardizabala bitermata* simply revels in our western humidity. The difficulty is to keep it within bounds and to prevent its smothering less robust growths with its glossy evergreen foliage. It has been in flower on the wall of our laundry for the last two months. The hanging racemes of the male flowers, though much hidden by the mass of foliage, are very beautiful in a vase. The six white stamens, monadelphously united, so as to simulate a style, stand boldly out, well relieved against the broad, fleshy sepals of intensely dark purple. The smaller petals serve to enrich the flowers, which smell like vinegar. They last a long time, so that all the blossoms on the spike—a dozen or more—remain open at once.

Some plants seem rash in the way they expose their flower-buds to winter cold; yet they do it with impunity. *Tricuspidaria lanceolata*, which we have 10 and 12 feet high, no sooner finishes flowering in June than the buds for the following June are displayed. *Viburnum rhytidophyllum*, a handsome evergreen, despite the disparagement it has received from some critics, is equally bold; and *Chianthus pumiceus* is now hung with innumerable green tassels, which I trust may burst into scarlet flame next May.

Rhododendrons, like everything else, are late this season. Only *R. daluricum* has flowered as yet; *R. parviflorum* will be next, I think, unless *R. Nobileanum* makes a spurt. The latter began on 1st November in 1913-14 and is seldom without flowers on New Year's Day. *R. przewalski* does not often open blooms before February. I have lately made the unwelcome discovery that this beautiful hybrid does not share the immunity from attack by hares and rabbits which distinguishes most species of this genus. A dozen plants which we put out in the woods in the autumn of 1915 were eaten bare in no time, although the winter was exceedingly mild, and although hares are very scarce and rabbits not very numerous.

For caprice and obstinacy in choosing to put forth its flowers commend me

to the Common Snowdrop, whereof there is great abundance in the woods here. One should suppose that the warmth and wet of the present season would have brought it forward early; but there is not a single blossom to be seen, although my notes show that in the twelve past years we have four times gathered the first Snowdrop in December. *Adonis autumnalis* has beaten it this year, for its flowers are now half-open. *Herbert Moorei*, *Monreithi*, *Wigtownshirei*.

OLEARIA GUNNIANA AND ITS ALLIES.

(Continued from p. 3.)

SUMMARY.

THERE are in cultivation three distinct species of this group of *Olearia*: (1) *O. Gunniana*, DC., with linear-oblong bluntly-toothed leaves about 1½ inch long and long, slender, more or less leafless peduncles; (2) *Olearia subrepanda*, Hutchinson, with small more or less obovate leaves hairy on both surfaces, and short leafy peduncles; and (3) *Olearia lyrata*, Hutchinson, with long tapered, lanceolate, entire leaves 4-5 inches long, and extremely floriferous shoots. *Olearia stellulata* is not in cultivation.

KEY TO THE SPECIES AND VARIETIES INCLUDED BY BENTHAM UNDER OLEARIA STELLULATA, AND DEALT WITH IN THE PRESENT PAPER.

- Leaves quite entire or the margins very slightly and obscurely undulate:—
 - Leaves lanceolate, acuminate, 8-15 cm. long; flower-heads collected into definite dense bunches—(1) *O. lyrata*
 - Leaves linear or oblong-linear, 5 cm. long or less:—
 - Leaves less than 1 cm. broad, more or less pointed, whitish-canus when dry; achenes hairy:—
 - Leaves up to 2.5 cm. long, obtuse or sub-obtuse; flower-heads crowded—(6*a*) *O. Gunniana*, var. *angustifolia*.
 - Leaves mostly 4.5 cm. long, acute; flower-heads crowded—(6*a*) *O. Gunniana*, var. *salsii* folia.
 - Leaves 2.45 cm. long, obtuse or sub-acute; flower-heads solitary or few together—(2) *O. ruscifolia*.
 - Leaves 1.15 cm. broad, obtuse, yellowish-tomentose when dry; achenes glabrous—(3) *O. flavescens*.
 - Leaves repand-dentate, coarsely crenate or lobulate;—Peduncles long and slender, leafless, usually overlapping the leaves:—
 - Leaves oak-like, rounded at the apex, oblanceolate, very coarsely crenately lobed (4) *O. quercifolia*.
 - Leaves coarsely repand-dentate, lanceolate, acuminate, 7.9 cm. long—(5) *O. stellulata*.
 - Leaves undulately dentate, linear-oblong or oblong, obtuse, 2.5 cm. long—(6) *O. Gunniana*.
 - Peduncles short and often leafy, more or less overtopped by the leaves:—
 - Leaves elliptic or ovate lanceolate, scabrid above, bullate when dry, 3.45 cm. broad, coarsely repand-serrate—(7) *O. rugosa*.
 - Leaves much smaller and narrower than in the preceding, never scabrid or bullate:—
 - Leaves more or less obovate, 1 cm. long or less—(8) *O. subrepanda*.
 - Leaves more or less oblong or linear-oblong, usually well over 1.5 cm. long:—
 - Flower-heads nearly 2 cm. in diam. across the rays:—

Peduncles very short and leafy with the flower-heads nearly hidden amongst the sub-entire leaves—*Gunniana*, var. *brevipes*.

Peduncles longer, the flower-heads with distinct peduncles exerted from the coarsely dentate leaves—*Gunniana*, var. *phlogopappa*. Flower-heads only about 1 cm. in diam. across the rays—*Gunniana*, var. *microcephala*.

1. *Olearia lyrata*, Hutchinson (comb. nov.).

[*Aster lyratus*, Sm. *Bot. Mag.*, t. 1509 (1813); *Diplostegium lyratum*, Nees, *Gen. et Sp. Aster*, 189 (1852); *Emyldia lyrata*, D.C. *Prodr.*, v. 267 (1857); Hook. f., *Fl. Tasman.*, i. 175, t. 45 (1866); *Olearia atkinsii*, Hook. f., in *Lond. Journ. Bot.*, vi., 109 (1847)]

by the subsending leaves, the individual peduncles usually very short and slender.

Grown in Knight's Nursery in the King's Road, Chelsea, in 1815.

2. *Olearia canescens*, Hutchinson, new sp.*

[*O. stellulata*, var. *canescens*, Benth., *Fl. Austral.*, iii., 475 (1866).]

Distrib.—New South Wales: Apsley River, ravines, tall shrub 6 feet high, Fraser 213; near Tennerfield, C Stuart.

Branchlets ascending, sparingly leafy; leaves oblong-linear or almost linear, obtuse or sub-acute, minutely subacute at the base, 2.45 cm long, 3.6 mm broad, quite entire and densely tomentulose with stellate hairs on both surfaces; lateral nerves sharply ascending; flower-

THE KITCHEN GARDEN.

By J. DENN, Foreman, Royal Gardens, Windsor.

SEED POTATOS.—Select and place in single layers all seed-tubers necessary for next season's Potato crop. Moderate-sized tubers are best. Those for planting early should be carefully set up on end in shallow trays or boxes, and allowed to sprout in a moderately cool place before they are planted. Sprouting the sets has considerable advantages, for it ensures a better development of the plants and a greater weight of produce. It is advisable to procure a change of seed each season; at least half the quantity of tubers required for planting should be obtained from a distance. It is important that all tubers intended for planting be stored in a cool, well-ventilated place until they are required.

FORCING POTATOS IN HEATED PITS.—The first planting of Potatoes for forcing should be done as soon as possible. The surface of the bed should not be more than 2 feet from the roof-glass. Plant the tubers in rows made 2 feet apart, and allow a space of 10 inches between the sets in the row. Cover them lightly with soil, and earth up the plants when the haulm is a few inches high. *May Queen* is one of the best varieties for this purpose.

CUCUMBERS.—If not already done, make a sowing of Cucumber seeds singly in small, clean pots, and germinate the seeds on a well-prepared hotbed in a house having a temperature of 75°. Grow the seedlings near the roof-glass, with plenty of moisture, and a temperature of 70°. Plants in bearing should be lightly top-dressed whenever roots appear on the surface. Keep the foliage clean by frequent light syringings, and tie and regulate the shoots as it becomes necessary, leaving only sufficient fruit on the plants to furnish a regular supply.

SALAD PLANTS IN PITS.—Plants for salads grown in pits require careful attention during the winter. Let them have plenty of ventilation, raising the lights in a manner to prevent rain from wetting them. Stir the soil between the plants frequently, and do all that is possible to prevent damping. Chinery may be had throughout the winter without much trouble or expense. The roots should be lifted as required, and placed in a dark chamber with just sufficient heat to start them into growth, and where there is not much atmospheric moisture, as the leaves are liable to become discoloured from damp. If only a small supply is required, the plants may be grown in large pots, placing the roots close together, and filling the spaces between them with finely sifted soil, which should be made moderately firm. Cover the crowns with an inverted pot of a similar size, and force them in a Mushroom house or dark pit.

WINTER SPINACH.—As soon as the soil is sufficiently dry stir the surface with the Dutch hoe. Remove all decaying leaves, and give a light dusting of soot to plants of winter Spinach which have been affording supplies throughout the winter.

THE FLOWER GARDEN.

By W. J. GRISE, Gardener to Mrs. DEMPSTER, Keele Hall, Staffordshire.

THE ROSE GARDEN.—Exceptionally severe weather in this district has necessitated the suspension of work in the Rose garden. The heaviest snowstorm experienced in this district for some years past occurred on December 22, whilst 14° of frost were registered on the 25th of that month. Our soil is thoroughly saturated, making it impossible to do any planting, and unless favourable weather occurs soon it will be advisable to delay the planting of Roses until the end of February, or even into March, for the soil then will be much warmer, and the roots will respond better to transplanting. Rose plants

FIG. 4.—OLEARIA LYRATA, TYPE. FROM A DRIED SPECIMEN.

Distrib. Victoria: Yarra, Mueller; near Melbourne, Adamson. New South Wales: Twofold Bay, Mueller. Mossman. Tasmania: York Town, Oct., 1845. Gunn 386; Larnneston, Oct., 1841. Gunn 496. Circular Point, Nov., 1837. Gunn 496; Formosa Nov., 1843. Gunn 496. Port Dalrymple, R Brown 2,010, without definite locality. Lawrence 114.

According to Gunn, this species, when it occurs in wet places in good soil, attains a height of 7-10 feet.

Branchlets arranged in long racemes and very densely flowered; leaves elongate-lanceolate, acuminate, 8.15 cm long, 1.5-5 cm broad, entire or with slightly crenately undulate margins, glabrous or nearly so, and impressed reticulate on the upper surface, mody tomentulose below, with prominently looped lateral nerves; flower-heads collected into dense leafless clusters overtopped

heads solitary or few together in the leaf-axils; peduncles long and slender, leafless. *J. Hutchinson, Kew.*

(To be continued.)

**Olearia canescens*, Hutchinson; sp. nov. (*O. stellulata*, var. *canescens*, Benth.); frutex altus, ramulis ascenduntibus parce foliatis (orbibus cam-tomentellis, lobis oblongo-linearibus vel fere linearibus, apice obtusa vel subacuta, basi cuneato-subacuta, 2.45 cm longa, 3.6 mm lata, chartacea inversa, utrinque pubes stellata dense tomentella, costa infra prominens; nervi laterales intravescens 6-7, ascendentes infra prominentes, petioli 2.3 mm longi); capitula axillaria, solitaria vel 3-3-rata, longe pedunculata, vixiter 1.2 cm diametro; pedunculis bracteis, 3-4 cm longis, tomentellis; involucri bractearum 4-5-seriatae, lineares, acutae, extra dense tomentellae, ab extremo sensim longiores usque ad 5 mm longae; apicibus nigrescentibus; flores radii numerosissimi, achenia dense adpressae pubescentia; pappus stramineus, 4.5 mm longus.

received from the nursery should have their roots immersed in water, eventually holding them in on a sheltered leyder. The names on paper labels are soon obliterated by rains, and such labels should be replaced by wooden ones as soon as convenient. A few of the plants may be placed in pots, plunging them in ashes or leaf mould. They will be useful to replace failures later in the season. In some gardens Rose-beds are heavily mulched at this date, but I do not recommend the practice, especially in cold, wet districts, preferring March, or directly after the work of pruning is finished, for this work. Established plants may require a little attention in slightly shortening extra long growths to prevent injury by winds.

DAHLIAS AND OTHER ROOTS.—Examine the stools of Dahlias and remove any decayed parts with a sharp knife. Begonias, Gladioli and similar plants should be inspected, removing any tubers or corms that show signs of decay.

BORDER CHRYSANTHEMUMS.—An abundance of strong, stocky shoots for cuttings should be available now, and onwards, from plants that were lifted in the autumn and placed in cold frames. Insert the cuttings in sandy soil, in pots or boxes. If preferred, the old roots may be divided and potted. Place the plants near the roof glass in a close, cool frame or pot, and afford them protection in frosty weather.

SOILS AND MANURES.—Where plenty of decayed leaves are available, these, together with decomposed vegetable matter and ash from the garden fire, should be well incorporated with the manure heap. The soil free of old Chrysanthemum stools and old potting soil generally, with a little sand and leaf-mould added, will make a suitable compost for various bedding plants, and should be stored in an open shed. Supplies of fresh lime, soot, sand, leaf-mould, wood-ash, and manure from spent Mushroom beds should also be placed under cover.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcliffe, Eastaun Park, Kent.

RICHARDIA AFRICANA.—The early plants of *Amn. Filices* are flowering well, and should receive copious supplies of water and liquid manure and soft water twice a week. When a constant supply of blooms is required, grow the plants in a light house, where the temperature ranges from 55° to 60°, with a rise of 10° by sunlight. Plants required to bloom at Easter should be grown in a considerably lower temperature, and ventilated freely to keep the foliage strong and sturdy. Do not crowd the plants, as this would cause the foliage to become drawn and the stems and flower stalks grow weak.

CYCLAMEN. Plants of *Cyclamen* raised from seed sown about fifteen months ago are blooming freely. Apart from the many strains of the ordinary type, there are several beautiful named varieties, including *St. George*, *Mrs. Graves*, the *fimbriated Mrs. Beckton*, and others of shades of salmon and scarlet. Keep the atmosphere of the house fairly dry, and ventilate freely in favourable weather. Do not allow the soil to become dry. Feed with weak manure-water at intervals. Two-year-old plants are later in blooming, but they produce an immense number of blooms, and provide a pleasing succession to the young plants.

SEEDLING CYCLAMEN.—Seedling *Cyclamens* growing in shallow boxes or pans will soon require shifting into small 60-sized pots. Use a light, sandy compost, pot loosely, and when potted place the plants on a shelf near the glass. Maintain a fairly brisk temperature in order to keep the plants growing freely. To have *Cyclamens* in flower in from 12 to 16 months from the time of sowing, it is necessary to grow them quickly in heat for the first half of the period. The seedlings should be sturdy little plants by now, each bearing several leaves. Spray them daily, keep their surroundings moist, and fumigate the house or pit lightly every three weeks.

CHRYSANTHEMUMS.—The main batch of large flowered varieties intended for blooming in November and December should, if the cuttings are not inserted already, be propagated now. Fill the cutting pots with a light, sandy compost, strike the cuttings in a moderate temperature and close atmosphere. As soon as they are well rooted, place the cuttings on a shelf, and gradually accustom them to more sunlight and air. Afterwards pot them singly, returning them to the shelves or stages near the roof glass. The newer varieties of singles are amongst the most satisfactory plants for decorative purposes of all kinds, and should be grown extensively.

THE SEED ORDER.—Overhaul the seed drawers and make a note of all seeds in stock, in order that the list for the seed-man may be sent without further delay. Many seeds are scarce, and it is probable that late comers will be disappointed, hence the necessity of ordering early.

FRUITS UNDER GLASS.

By THOMAS HENSON, Gardener to George and Mrs. Henson, Esq., C.V.O., Gunnersbury House, Acton, W.

EARLY FORCING.—In my opinion, fruits have been forced in many gardens to an undue extent, the return not being commensurate with the labour and expenditure involved. I refer especially to forcing commenced late in the autumn, when the days are shortening, and there is little assistance from fine sunny weather. The high cost of fuel makes it almost prohibitive now, and early forcing should be discouraged. The shortage of labour is another factor that must be considered in this matter. By surveying events, forecasting the future and readjusting labour in a corresponding manner, British gardeners will be equal to any emergency.

FRUIT TREES IN POTS.—Our *Peach* and *Nectarines* in pots are still dormant, and we do not intend to start them until the swelling of the buds makes it imperative. Not until the flower-bud of our early *Peach* and *Nectarines* shows colour will the temperature in the houses be raised slightly, and then only to prevent injury from frost. In this way I often get having one fruit early in June with no undue amount of forcing. But it is considered necessary to commence forcing earlier, as a start may be made now. I have noted during the past two winters that trees that have formerly been started early to produce one fruit by the first week in May will start even in a cold house of their own accord, and this is a case of trees trained to "believe." Thence onwards it is safer to encourage the progress of the blossom, and not to run any risk.

CHERRIES.—The *Cherries* in pots are still resting in a cold house. Most of the trees have been forced for several years, hence they will not remain dormant much longer. No fruit grown in pots requires so well the time and labour involved as the *Cherry*, and trees in pots are infinitely better for supplying early fruit than those planted out, hence more under control.

FIGS. The best first early variety is the *St. John and Pingo de Mel*. The two are almost, but not quite, identical, the second crop of the latter being distinct from that of the former. These varieties give good results when lightly forced as pot trees. To plant them out, however, is to court failure, as their growth is far too luxuriant. Late *Figs* in pots, such as yielded crops last autumn, need attention if they have not already been seen to. The collar or ring of top-dressing will be removed carefully from our trees, and any roots that have grown in it carefully preserved. Afterwards some of the surface soil will be removed, the exposed roots placed in position and covered with fresh soil. Trees that need re-potting will be attended to at the same time. The trees will then be placed in a house from which the frost is just excluded. The soil I use for growing *Figs* is a fibrous, calcareous loam mixed with old mortar rubble and manure from a spent Mushroom bed, sufficient of the last two materials being used so that their presence may be noted easily. Good

against root-potting, and so that the pots are well drained. At Gunnersbury House we have large numbers of trees. No large main party, but the fully ripened fruit, odd in 12-inch pots.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Rev. Arthur J. Davis, Abbot's Wood, Godalming, Surrey.

AMERICAN BLIGHT.—Any trees infested with this disease should be carefully gone over with a hard brush used with an insecticide, but in the case of very old trees that are improbable it would be better to root them up and burn every scrap, and also the soil in which the roots have grown.

PRUNING. Make an effort to finish the work of pruning, taking advantage of mild, open weather to do as much as possible, and even utilising cold, windy days to do the lee sides of walls. Almost every tree has its peculiarity, and in pruning this must be studied. The character of the varieties must also be taken into consideration. Always bear in mind that it is wiser to practise summer pruning, and especially in the case of stone fruits, than to do much winter pruning. Where the shoots were shortened in summer all those not required for extension should be cut back to about three buds, making clean cuts. Plums on walls should be attended to first. The fruit spurs will be readily seen, and these require little or no pruning. The other shoots should be pruned to not more than two or three eyes. Tie in the main shoots with tarred string and leave room for the branch to swell, as the string lasts, as a rule, two seasons. If spurs and nails are used do not use very wide shreds, as these offer breeding places for insects. Train the shoots of fan trees straight from the base, and do not train the main branches closer than 8 to 10 inches apart.

ROOT-PRUNING. It is not too late to root-prune unfruitful trees, that are making very rank growth. The need for root-pruning is generally due to the growth of a tap root or other roots into the subsoil, and to get at these it is necessary to open a trench about 3 or 4 feet from the tree and remove the soil from the base of the tree with a fork. As the grass-growing roots are found they should be severed. It is a good plan to rock the tree from side to side to ascertain where the anchor roots are growing; indeed, this method is often effectual in breaking such roots. In refilling the trench take care to place the fibrous roots in position and ram the soil firm as the work of filling in proceeds.

VINES ON WALLS.—Vines in the open may be pruned now, and the earlier the work is done the better. Nail or tie in the long growths for extension and prune the laterals or spurs to one strong bud. If the vines have suffered from mildew they should be painted with flowers of sulphur mixed with a little milk and petroleum to cause the sulphur to adhere to the wood. If the roots require attention the present is a suitable time to see to them, making use of the opportunity to add a little lime rubble and bone meal to the soil. Hardy vines, whether grown for fruiting or the embellishment of walls and pergolas, do not usually receive the attention their merits deserve.

BUSH FRUITS. It is not too late in the season to make new plantations of bush fruits. Let the ground be prepared thoroughly, trenching it if possible. If the ground for planting has recently carried fruit trees collect all roots and burn them and thoroughly sterilise the soil. It would be preferable to choose a fresh site and crop the old fruit quarters with vegetables. Some of the bushes may be grown as cordons. All kinds of bush fruits may be grown on old spaces on walls as cordons or in gridiron shape. Some should be planted against a north wall to give late fruits to furnish a long succession. The work of planting Raspberries should be finished as soon as possible. The canes in old plantations should be tied in position, the ground cleaned and made free from weeds.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher—Our correspondents would expedite delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are mis-directed.

Illustrations—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents—The Editors do not undertake to pay for any contributions or illustrations or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, JANUARY 15—

National Dahlia Soc.'s Annual Meet. at Hotel Windsor, at 4 p.m.

TUESDAY, JANUARY 16—

Royal Hort. Soc.'s meet. at London Scottish Drill Hall, Buckingham Gate, Westminster, Nat. Rose Society's Annual Meet. at Hotel Windsor, at 3 p.m.

THURSDAY, JANUARY 18—

Manchester and N. of England Orchid Soc.'s meet.

AVERAGE MEAN TEMPERATURE for the ENSUING WEEK (deduced from observations during the last 51 years at Greenwich, 38.3°).

VACUUM TEMPERATURE:

Gardens' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thursday*, January 11 (10.0 a.m.): Bar, 29.3°, temp. 41°. Weather—Snow.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Bulbs, Herbaceous Plants, Rhododendrons and Fruit Trees, at 12 o'clock; Narcissus, late-flowering Tulips, Gladioli, at 2 o'clock; 1,500 cases of Japanese Lilies, at 3 o'clock, at 67 and 68, Cheapside, by Prothero and Morris.

THURSDAY—

Roses, at 67 and 68, Cheapside, by Prothero and Morris, at 1 o'clock.

Soil Ventilation.

It is curious how the discoveries of the scientific agriculturist confirm the accepted practice of the gardener. The most recent illustration of this fact consists in the recognition that ventilation, that is to say aeration, is a factor of first importance to the growth of field crops. The deep and thorough cultivation as practised by gardeners, the constant stirring of the soil, the incorporation with the soil of gritty material, all serve among other things to supply plenty of air to the roots of plants.

There is evidence that this abundant supply of air is beneficial in numerous ways. Firstly, of course, because roots, like all other parts of plants, require oxygen for their growth. It is a commonplace experiment to place seeds of Barley in water and to observe that if the water be stagnant but poor growth occurs, whereas if it be kept running the Barley develops for a time quite normally as a submerged plant. Secondly, a constant circulation of air allows of the escape of the carbon-dioxide given off by the roots,

Here, again, it appears to be well-established that an excess of carbon-dioxide in the soil results in a check to the growth of roots. Indeed, roots seem to be peculiarly susceptible to injury from carbon-dioxide; for example, if the soil space contains too much of this gas the roots fail to perform the normal growth movements and curvatures which enable them to find their way about the soil.

Thirdly, it cannot be doubted but that a good supply of air favours the activity of beneficial soil bacteria. As gardeners, therefore, we may continue to cultivate our soils deeply and assiduously with the satisfaction of knowing that, as Whistler said of Nature that she was "creeping up to Art"—so the art of Agriculture is creeping up to that of Horticulture.

It is, of course, evident that deep cultivation has other advantages as well as that of providing "root ventilation." It increases the water-holding capacity of the soil, improves drainage, and helps to liberate larger stores of plant food. Anything, therefore, which helps to induce the agriculturist to practice more widely a system of deep tillage is bound to be to his benefit and to the benefit of the world at large.

Increasing Food Production.

We are glad to see that in a recent speech the President of the Board of Agriculture expressed the intention of enlisting the services of schoolmasters and children in the increased production of vegetable food.

A month or so ago, when a deputation of the Royal Horticultural Society waited on the officers of the Board of Agriculture and laid before them the outline of a scheme for organising the increased production of food throughout the country, the deputation urged in addition to the carrying out of its scheme the institution of school gardens in connection with all rural schools; and, wherever possible, suburban schools as well. The deputation pointed out that the standard of cultivation in many school gardens is high, and that by devoting the ground of the school garden to the cultivation of vegetables a considerable increase of food crops would be forthcoming. They suggested, further, that since it is essential that the school garden must be directed by competent persons, where the schoolmaster or mistress does not possess horticultural experience, the services of a local gardener should be secured. We hope that Mr. Prothero's speech means that these suggestions are to be carried out. The larger proposal of the Royal Horticultural Society involved the use on a national scale of the voluntary services of gardeners as advisers and instructors in the areas within which their work lies. We are convinced that if these suggestions were adopted the standard of cultivation would be raised high above the level at which it is bound to stand if cultivation is carried out without their expert aid. We are

aware that the Board of Agriculture is working against time and that the major part of its energies must be directed to securing the adequate and extended cultivation of farm land; but, at the same time, it is greatly to be desired that the fullest provision should be made for the intensive cultivation of crops on a horticultural scale.

NEW ISSUE OF THE HORTICULTURAL DIRECTORY AND YEAR-BOOK.

—We much regret that the publication of the Horticultural Directory and Year Book for 1917 has been delayed by unforeseen and unavoidable circumstances. First, the difficulties in regard to printing and paper supplies have increased greatly of late; and secondly, the number of corrections that have to be made this year is altogether unusual, owing to the fact that so many gardeners have joined the Army. To those who have already sent us prepaid orders we offer our apologies for the delay, and assure them that everything that can be done is being done to expedite publication.

ALMANAC.—With the present issue we publish a Supplement containing the yearly almanac. As is inevitable, it is less full of events than usual. The Royal Horticultural Society's fortnightly meetings are to be continued, though it appears to be certain that the Chelsea and Holland House shows will be abandoned. The National Sweet Pea Society and other floral societies have the question of holding their shows under consideration.

ROYAL HORTICULTURAL SOCIETY.—The first fortnightly meeting and exhibition of the Royal Horticultural Society in 1917 will be held on Tuesday, the 16th inst., at the London Scottish Drill Hall, Buckingham Gate, Westminster.

BOARD OF AGRICULTURE AND MUNICIPAL FOOD PRODUCTION.—Since the publication of the leading article in our issue for December 23 last, the Board of Agriculture has decided to accept responsibility for the financial arrangements in cases where local authorities acquire land for the purpose of cultivation, as under the Board's own scheme for allotments. The City of Manchester has appointed a Foodstuffs Special Committee, and Mr. W. W. PETTIGREW, chief officer for the Manchester City parks, has been appointed chief officer of the Committee. In addition to acquiring land, the city intends to put several hundred acres of its own land under cultivation, but in this case the Board of Agriculture will not bear responsibility. The Board is receiving a very large number of offers of assistance. The carrying out of the various schemes of the Board of Agriculture will be entrusted to War Agricultural Committees in each county, and Mr. PROTHERO suggests, therefore, that all persons who desire to offer their services should communicate with the secretary of the local War Agricultural Committee at the offices of the County Council.

DR. HEMSLEY.—DR. W. BOTTING HEMSLEY, F.R.S., our old correspondent, who retired from the post of Keeper of the Kew Herbarium in December, 1908, and has since resided at Twickenham, is about to remove to Kew Lodge, St. Peter's Road, Broadstairs, which will hereafter be his permanent address.

NATIONAL ROSE SOCIETY.—A special general meeting of the National Rose Society will be held at the Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 16th inst., at 2 p.m., for the purpose of: (1) Motion to rescind present rules relating to the society's constitution; and (2) Motion for adoption of new rules in place thereof. The special meeting will be

followed by the fortieth annual general meeting of the society.

CASTLEWELLAN.—Gardeners will regret to hear that the fine residence of the ANNESLEY family at Castlewellan, County Down, was partly destroyed by fire on Tuesday last. The fire destroyed the whole of the left wing, in which was the celebrated armoury. The estate lies four miles from Newcastle, a small watering-place situated at the foot of the Mourne Mountains, just where they dip into the Irish Sea. The castle is built of blue granite, and stands on a slight eminence at the extremity of a fine

simplicity and economy of tank-heated structures have been sufficiently proved, many find it expedient still to adhere to the old-fashioned dung bed for early forcing. This, when properly managed, is undoubtedly equal to the tank as to character of produce, more especially for Cucumber growing, if not commenced too early. The most important matter is to work the dung well—few work it enough. I need scarcely say that the oftener it is turned the better; for if it lays long without disturbance, it soon burns, and this, if permitted to a great extent, will so break down the texture as to render it almost

dry and pulpy. It should be of that character that water, whether from long-continued rains, or from processes within, cannot remain a moment. There is no real advantage in going below the ground level where beds have to be worked in the main by linings. In the case of later beds this is sometimes found expedient. Some practitioners from the first foot or more at the bottom with Brushwood, and good practice it is. If no Brushwood is at hand, any ordinary unfermented materials which possess no animal matters in them may be placed beneath; and in placing the well-wrought manure

FIG. 5. CASTLEWELLAN, WHERE A SERIOUS FIRE OCCURRED ON TUESDAY LAST.

sheet of water. The gardens are amongst the most interesting in Ireland. They abound in rare sub-tropical plants, the most notable specimens being species of *Senecio*, *Pittosporum*, *Podocarpus*, *Bambusa*, *Eucryphia*, *Lomatia*, *Osmanthus*, *Daphniphyllum*, *Latic Kaempferi*, *Aciphylla squarrosa*, *Japanese Acer*, *Eriobotrya* and *Eucalyptus*. Several of the more notable species have been illustrated in these pages, accompanied by descriptions by the 4th Earl of ANNESLEY, who has an enthusiastic gardener.

FORGING WITH HOT BEDS SEVENTY YEARS AGO.—Notwithstanding that the much greater

impenetrable by the heat of the linings. At this period it should receive four distinct turnings, which may be about four or five days apart, the middle of the heap being each time exchanged for the outside. Water must be applied at each turning, provided the least symptoms of dryness or "burning" is perceived. When cutting winds prevail it is often necessary to use a cover or lining of long litter to the heap undergoing fermentation; for it is with this, with a bonfire, the wind has a tendency to drive the power to one side, leaving a portion of the material unoperated on by the heat. In building a hotbed, always secure in the first place a

in the corner of building, depend rather on a skilful placing of the material than on hard beating with the fork, always keeping the front part rather in advance of the back, in order that the bed may not incline too much and topple over. As soon as built, our practice is to apply a strong lining as high as the edge of the frame at top, in order to force the bed to the extreme point, taking care to water it less or more every day. In a few days, by this treatment the heat will be slightly on the decline; a portion of the lining may then be dispensed with, and if for Cucumbers or Melons holes made in the centre of each light for the

reception of the killocks. These may be opened three parts the depth of the bed, and plenty of raw, half-chopped turf thrown into the bottom. On this the killock may rest, and if there be danger from burning, a thick turf may be placed horizontally under each bill of soil. The main thing to be avoided is too much bottom heat—more especially under the killock, the heat to which should be received immediately from the rest of the bed, or rather from the linings. *Gardeners' Chronicle*, January 16, 1847.

THE KEEPING OF PIGS, POULTRY, RABBITS, &c.—The increase of pigs in this country is the quickest possible way of adding to our meat supplies. If people would, either individually or in combination, undertake the keeping of pigs in the present crisis, the stock of pigs in this country could be, within a few months, greatly increased. Quantities of valuable pig-fodder are wasted every day in our towns and villages. If arrangements could be made for collecting the waste from butchers, poulterers, fishmongers, fruiterers, greengrocers and dairies, from the hotels and boarding-houses as well as from other dwelling-houses, this daily loss would not only be prevented but turned into the gain of valuable meat.

It is important, wherever practicable, to allow pig-keeping in the neighbourhood of towns and villages to save the cost of transport of material. The question arises how far this would be hampered by restrictions contained in the by-laws of local authorities.

In many rural districts there are no by-laws on the subject at all. In others the by-laws only require that the places where pigs are kept shall be clean and wholesome. In most urban districts, however, and in a few rural districts, a by-law is in force which provides that pigs shall not be kept within a prescribed distance of dwelling-houses. A regulation is about to be made giving power to sanitary authorities to grant permission for the keeping of pigs, either generally or in particular cases, notwithstanding the provisions of any such by-law, subject to the observance of any directions of the authority in the interests of public health. If persons intending to keep pigs alive in places where such by-laws are in force they should inform the local authority, with a view to obtaining their permission. It will be necessary for keepers of pigs to obey such conditions as to clean and wholesome maintenance as the local authority may impose.

We intend to bring this matter to the notice of the sanitary authorities, and to suggest that, subject to any advice given to them by their Medical Officer of Health on grounds of public health, a Council should not hesitate to consent to waive its by-laws in suitable cases, or, where circumstances permit, to give a general dispensation under the powers conferred by the new regulation. We shall also suggest that the Councils should do what they can to facilitate co-operative efforts for the collection of waste and for the keeping of pigs.

Householders unable to undertake the keeping of pigs may do admirable service by keeping poultry or tame rabbits in order to add to the nation's food. They may also assist by setting aside edible house refuse to be collected for the feeding of the stock of other people. *Blondie (President of the Local Government Board)*, *R. E. Prothero (President of the Board of Agriculture and Fisheries)*, January 4, 1917.

TO RE-ESTABLISH ALLIES' FORESTS.—The Royal English Arboricultural Society are co-operating with the Agricultural Relief of Allies' Fund in inquiring whether it is possible to render help to our Allies in re-stating the woods and forests which have been destroyed. Inquiries made in France, Belgium and Serbia show that the tree of the greatest value is the Scotch Pine (*Pinus sylvestris*), which readily adapts itself to varying soil and climate. Large quantities of these trees are now being cut in

Scotland, and it is a comparatively simple matter to save and store the cones for the distribution of the seed required. The cones are rapidly approaching the stage most suitable for the purpose, as later on they swell and the seed is disseminated by the winds. The Serbian Government has asked for 4,000 lbs. of this seed, which they can immediately utilise, and the French Minister of Waters and Forests has outlined a scheme asking for a supply of seed for the coming spring to be followed next autumn by a further quantity and later on by a supply of young plants of Oak, Beech, Pine, etc. It is possible also that the rich forests of Douglas Pine in Canada may be drawn upon by the Canadian branch of the Allies' Committee in order to contribute their quota to what would form a permanent memorial of British sympathy.

WAR ITEMS.—We regret to learn that JOHN DIVERS, nephew of Mr. W. H. DIVERS, and sub-foreman in the Heriaceous and Alpine Department, Kew, is reported missing and believed killed. Mr. DIVERS commenced his gardening career at Roath Park, Cardiff, and he served later at Belvoir and Kew.

—LANCE-CORPORAL CRAME, who was employed in Messrs. STUART LOW AND CO.'S BUSINESS before the war, has been awarded the D.C.M.

SERGEANT CRAME, AWARDED THE D.C.M. AND RUSSIAN MEDAL OF ST. GEORGE.

and the Russian Medal of St. George, 3rd Class, for the following act of gallantry, as officially recorded: "This N.C.O. led his section in the attack on a German strong point in the most gallant manner. In the first attack he was wounded in the foot, but, after having had his foot dressed, returned to take command of his section, which he again led to the attack. He was wounded a second time, but, after having had his wound dressed, he again returned to his section. Wounded a third time, he again returned to his section after his wound had been dressed. He remained with his section until it was relieved, and even then refused to leave it until ordered to do so by his officer." CRAME has since been promoted Sergeant.

THE FOOD PROGRAM.—The War Emergency Committee of the Royal Agricultural Society, under the chairmanship of Mr. ADKINS, has decided to make the following representations to the Board of Agriculture: (1) That, Potato seed being so scarce, it is advisable, with a view to the greatest production, that so far as is possible all available seed should be concentrated on the land which is likely to grow the best crop per acre. If a price for Potatoes is to be fixed the price for early Potatoes and that for the

main crop should be differentiated, and in view of a likely shortage in June and July of 1917, it is desirable to encourage the growing of early Potatoes. The date when the early crop ends and the main crop begins might be taken to be August 15; (2) that as spring Wheats are being sold for milling purposes, steps should be taken to retain a sufficient quantity of suitable varieties for spring sowing; (3) as all work of cultivation is frequently suspended during threshing, owing to scarcity of labour, adequate soldier labour should be made available to travel with and assist in working threshing machines; (4) as spring sowing is imminent, information should be given without delay with regard to the terms and conditions under which the crops are to be grown; especially with reference to the fixing of prices and the supply of manures; (5) that the Board should provide funds for the purchase by War Agricultural Committees of tractor ploughs and other necessary agricultural implements.

—With the approval of the King, SIR ALFRED MOXD, the First Commissioner of Works, has given instructions for the grounds of the Convalescent Home for Officers of the Navy and Army at Osborne to be planted with Potatoes.

POTATO PRICES FOR 1917.—The prices for main crop Potatoes have been fixed by the Food Controller as follows: For quantities of not less than six tons, free on rail or free on board, 115s. per ton for delivery, from September 15 to January 31; 120s. per ton for delivery in February and March; 150s. per ton for the remainder of the season. The prices in each case are for produce of first quality delivered, as required, in sound marketable condition. In fixing the maximum price for Potatoes at 115s.—150s. per ton, the Board has taken the most effective means in its power to discourage the widespread planting of Potatoes. We should be glad to know whether that is the object of the Board, and, if so, how it can be justified. There is an admitted shortage in the world's food supply. The Board has recently taken steps to induce allotment holders and small cultivators generally to increase food production. It has now fixed a price calculated most effectively to discourage the growing of the chief crop which such cultivators would have undertaken to produce.

PUBLICATIONS RECEIVED.—*Tropical Agriculture*. By Earley Vernon Wilcox, A.M., Ph.D. (New York and London: D. Appleton & Co.) Price 10s. 6d. net.

A GARDENER-SOLDIER IN INDIA.

LIKE many other gardeners I joined his Majesty's Forces under the Derby scheme. After training in England we set sail for India. The voyage occupied about six weeks, the first stop being Gibraltar, the sight of which makes an Englishman feel proud. In marching round the town we saw several interesting gardens, and many plants that require greenhouse treatment in England were here growing and flowering profusely. *Plumbago capensis*, *Bougainvillea scabra*, *Ipomoea rubro-coerulea* and *Nerium Oleander* may be mentioned as examples.

At Malta again the floral subjects attracted attention. *Hibiscus*, *Mesembryanthemum*, Palms, and Cactuses were noted, and Grapes were procurable at a reasonable price. This was the only fruit at Malta, but at Gibraltar Grapes, Figs, Apples, Pears, Apricots, Peaches and Pomegranates were obtainable.

During the voyage I discovered several gardeners abroad, notably Gunner J. Thompson, gr. to Barrow Cadbury, Esq., J.P., Cropwood, Blackwell, Bromsgrove; Gunner A. J. Jarrett, gr. to Capt. Hon. C. Dorner, Grove Park, Warwick; Gunner E. F. May; Gunner F. L. Weston, gr. to Mrs. Palmer, Marlston House, near Newbury; and several

others whose addresses I have forgotten. These are now stationed in various parts of India, and probably I shall not meet them again in India.

At Bombay the Bananas are of excellent quality, and can be purchased at the rate of four for one anna (1d.).

Crotons, Hibiscuses, Musas, and Palms thrive

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE ORIGIN OF THE LOGANBERRY (see p. 9).—In the *Cottage Gardeners' Dictionary*, published in 1852, under the heading "Raspberry," it is stated that "Mr. Rivers, of Sawbridgeworth, has a new variety from America

at least the name, possibly J. S. Maiden, see *Orchids, Cabbages, Straws*."

STRAWBERRIES. The earliest Strawberry plants that were started some few weeks ago are sending up their turesses of flowers. At that stage the plants should be removed to the light, east and most airy part of the house, as being favourable to the setting of the fruit. Admit fresh air from the time the plants are introduced into heat until the fruits begin to swell. Pollinate the flowers when pollen is plentiful with a camel's hair brush. Care in watering is of the utmost importance. Fumigate the house lightly at short intervals prior to the opening of the flowers. Fresh batches of plants should be prepared for forcing, and placed in shallow pits, firmly filled with fermenting leaves. Plants for late fruiting cannot be kept too cool at present, but they should be plunged in a bed of suitable material and protected from very severe frosts. J.

GARRYA ELLIPTICA.—The idea that *Garrya elliptica* is only suitable for sheltered positions in the South is probably due to the fact that, although introduced so far back as 1818, it has never been widely planted. Its hardiness, now even is beyond question, as I have seen it flourishing in an exposed position so far north as North. In the gardens at Brougham Hall there is a well-developed plant 10 or 12 feet high in the shrubbery border. The position is a severe test of hardiness, as it faces east and is open to the high winds which sweep across the country from the Pennine Range. I had believed the plant to be tender before going North, and was surprised to find so good a specimen in this position, but during the five years that I was there it never failed to produce a full crop of its beautiful catkins, and was never disfigured by cold winds. There is a plant in these gardens planted in 1809 which has already attained a height of 22 feet, so that it would appear that not only has its hardiness been underestimated, but also its vigour. W. Wilson, *Pierrefort Court Gardens, Woking*.

THE VALUE OF INTERCROPPING.—With reference to my advice on intercropping, I must apologise to Mr. Archer and other readers that the article did not read as I had intended. It should read, "To put early Lettuces between Onions and Strawberry plants, and Spinach, Cauliflower, Cabbage, Turnips or dwarf Beans between rows of Peas and summer Beans." Taking Onions first, they should be put out 15 inches between the rows and the space between each row filled with Lettuces; any Cabbage variety that was sown in August to withstand the winter being suitable. Both the Onions and the Lettuces may be planted at the same time, and there could be no danger of damaging the Onions if the rows were planted alternately as the space is filled. Strawberries in rows 2½ feet apart could be planted in a similar manner, with Cabbage Lettuces, or if preferred with Cos varieties. I have myself grown the Cos variety Winter White

FIG. 6.—POT CHRYSANTHEMUMS AT AN INDIAN FLOWER SHOW.

exceedingly, the somewhat moist atmosphere being suitable for this class of plant.

I was eventually transferred to Allahabad, Weiron to Ferozpoor (near Lahore), and May remains at Bombay. The country is very flat around Allahabad, and here the rivers Jumna and Ganges meet.

Kew men are all over the world, and I was not long in finding out an old Kewite, Mr. W. Head, superintendent of the Government Gardens and Parks, Allahabad, who is giving me every assistance in finding out gardens of interest. So far I have had opportunity to visit any gardens, but the district can boast of a host of enthusiastic amateur gardeners, as the recent flower show testified.

This show was held on December 2, 1906, and the principal flower shown was the Chryanthemum. Mr. Head, the hon. secretary, five or six groups, and several groups of special varieties which he had been giving a trial. The single varieties are great favourites with Mr. Head, and one group consisted entirely of single sorts, which were raised in the Park Gardens. The pink and yellow shades were very good, several being worthy of a name. Competition was very keen in nearly every class, and except a few good blooms of the following were noted:—Oriental, Mrs. T. Stevenson, Queen Mary, Bob Pulling, William Vert, Rosamund, Mrs. A. Herbert, Daily Mail, Prince of Wales, Ethel Thorpe and J. Lock.

In the classes for Coleus and Crotons there were numerous entrants; both the Crotons and Coleus were well grown and highly coloured, and Mr. Head raises annually a large number of the latter from seed, which he saves from selected plants. The show was held on the hockey ground in Alfred Park, Allahabad, and amid picturesque surroundings.

The general condition of the plants shown did credit to the exhibitors. The summer and rainy periods are both detrimental to the well-being of the Chrysanthemum, and only diligent care and attention could bring them to such perfection. Another show will be held in February.

The judges were Gunner W. E. Conybeer (ex. Canon Langford, Southbrook, Devon), Bom Langdon (of Messrs. Blackmore and Langdon), and Gunner T. W. Bresse (ex. to R. Lysaght) T. W. Bresse, Allahabad.

which is a hybrid between the Raspberry and the Blackberry, as Mr. Rivers called "the Blackberry Raspberry." However, it is

FIG. 7.—CHRYSANTHEMUM EXHIBITED AT AN INDIAN FLOWER SHOW.

sure that, although a hybrid, it may have been even spontaneously introduced from America.

FIG. 8.—THE GOVERNMENT GARDENS, ALI AHABAD.

with great success, the heads turning the soil at three and three-quarter points, and I also had a good crop of Strawberries. In cropping between rows of Peas, I prefer to sow the Peas in rows 5 to 6 feet apart and to plant a single row of cabbage, Cauliflower, or dwarf Beans between them, or to sow two rows of either Turnips or Spinach. With reference to Mr. Archer not succeeding with dwarf Beans sown in front of greenhouses or under a south wall, this goes to show that dwarf Beans dislike a dry, sunny border. I should like him to try my method of planting this crop between rows of Peas. The partial shade of the Peas seems to suit their requirements, and such soil is doubtless more moist than a sunny south border. The dwarf Bean requires plenty of moisture, hence the usual practice of growing them in the humid atmosphere of a vinery for an early crop. A distance of 6 feet should be allowed between the rows of runner Beans, and the same remarks apply to this crop as to Peas. I do not agree with Mr. Archer that the instruction of amateurs can only be done by one on the spot. Many useful things may be learned from "The Week's Work" in the *Gardeners' Chronicle*. L. F. Bagg, Holmwood.

THE LATE GEORGE SCHNEIDER. (see p. 11).—The remains of George Schneider were interred on Friday, the 5th inst., at East Sheen Cemetery. They were followed to the grave by the members of his own family, who were joined by a few personal friends and one or two members of the French Horticultural Society. We noticed by the graveside Mr. and Mrs. W. O. Heble; Mr. and Mrs. Peavot (Mme. Ripard and her husband are in France); Mr. Otto Hehle, M. Binot, Mr. D. Inguanelli, Mr. Thos. Bevan, Mr. John McKersher, Mr. Tivey, Mr. John Heal, V. M.H., M. Guillaud, M. J. Bittner, M. Meilli, M. Wynys, and Mr. Harman Payne. Floral tributes comprised some beautiful wreaths of Mme. Abel Chateaux Rose, with which the coffin was adorned, and also wreaths from most of the mourners already named. In addition there was a very striking one from the Société française d'horticulture de Londres, with its broad band of tricolor ribbon, and others from Sir Harry Vetch, Mr. Edward Sherwood (Hurst and Sons), Mr. R. Percy Kaye, and Mme. Schneider, the widow, who was too unwell to be present at the ceremony. A slight error crept into your note in your last issue. Although deceased for nearly lived for many years at 17, Field Road, Fulham Road, at the time of his death he had been residing for some time at 3, Meredyth Road, Barnes, S.W. C. Harman Payne.

FRESHLY-TURNED LAND AND THE POTATO.—Very much has been, and is being, written to-day in the gardening and daily Press upon this dual subject; but seldom is there any mention of the particular food required by the Potato-potash. In prepared manural form this fertiliser is admittedly difficult to obtain, but we have it in a rougher degree in old leaves and wood ashes obtained from burnt prunings. What is of paramount importance just now is the fact that quite near to much of the land to be broken up are quantities of these old leaves in ditches, among trees, and lying alongside fences. May I advise those having the above work to superintend or who are breaking it up themselves to seize what is to be had of such material and work it in the trench as digging or trenching proceeds? The wood ashes can also be applied now likewise or scattered over the surface freshly dug or, as I prefer, kept back until the spring and scattered over the ground just before cropping time. C. Turner, *Widgobol*.

TRADE NOTE.

MESSRS. ALEX. DICKSON & SONS' NEW PREMISES

MESSRS. ALEX. DICKSON AND SONS, LTD., seedsmen and nurserymen, have removed the headquarters of their business from Royal Avenue, Belfast, to new premises at the corner of Royal Avenue and Garfield Street, and in future the firm's address will be Hawkhawk Buildings, Belfast.

Obituary.

WILLIAM THOMPSON.—We regret to record the death of this well-known horticulturist, which took place at his residence, Walton Grange, Stone, Staffordshire, on the 22nd ult. Mr. Thompson, who attained his 84th year in September last, was for many years a prominent personality in the locality in which he resided and a strong supporter of horticulture and the gardening charities. For many years and until quite recently he was a member of the Orchid Committee of the Royal Horticultural Society, and he was one of the judges at the International Horticultural Exhibition of 1912. Orchids were his chief hobby, and for over forty years he continually added of the best to his extensive collection, and raised many hybrids, especially in *Odontoglossum* and *Cypripedium*. The records of the Orchid Awards of the Royal Horticultural Society include a large number of the late Mr. Thompson's fine varieties, his favourite class of blotched *Odontoglossum* beginning with a First-class Certificate for *Odontoglossum crispum* Thompson's variety, April 12, 1887, and following with a dozen other varieties, the last being *O. crispum Perfect Gem*, June 8, 1915. His hybrid *Odontoglossum*, which are among the most beautiful ever raised, have been recorded in these pages. *Cypripedium mirum*, for which a Gold Medal was awarded by the Manchester Orchid Society on November 27, 1915, was a fine example of the Walton Grange strain, and took part in the production of many of the handsome seedlings since raised there. Mr. Thompson, who had been married sixty years when his wife died in May last, leaves one son, Captain A. E. Thompson, and four daughters.

ANSWERS TO CORRESPONDENTS.

A GARDENER'S NOTICE. J. T. It is customary for a head gardener to give and receive a month's notice to terminate an engagement.

CURTIS. J. H. Write to Mr. H. Ellison, nurseryman, 5 and 7, Bull Street, West Bromwich.

FERTILISING IN BRASSICAS. W. P. H. Dress the soil with quicklime and sulphur, applying the lime now at the rate of 15 cwt. per acre and the sulphur in the spring, using 5 cwt. to the acre. A correspondent in *Hardy China*, August 8, 1914, p. 118, states that if the seed is covered with red lead this will prevent attacks of clubbing. The seeds must be just damp and rolled in the lead, for if too much water is used there will be a difficulty in sowing the seed. You might also adopt the old-fashioned method of puddling the roots of seedling Brassicas in a mixture of clay, soot and lime, before planting them. Do not grow plants of the Carbage tribe, which includes Turnips, on the same ground two seasons in succession.

DESCRIPTIONS OF ERYSIUM AND MATTHIOLA. A. and B. The distribution of the species you mention is as follows: *Erysimum altaicum*, Altai Mountains; *E. arkansum*, a variety of *E. asperum*; *E. asperum*, North America; *E. bulgaricum* (we cannot trace this name); *E. hylcicum*, a narrow-leaved variety of *E. ochroleucum*; *E. kotschyannum*, Asia Minor; *E. ochroleucum*, Europe; *E. peroffskianum*, Caucasus; *E. pulchellum*=*rupestre*; *E. pumilum*, Switzerland; *E. purpureum*, Annonia; *E. rupestre*, Asia Minor, Matthiola Islands, Greece and Asia Minor; *M. Fenes-tralis*, Crete; *M. pedimontana*, a form of *M. varia* from the Piedmont; *M. tristis*, South Europe ("Night-scented Stock"); *M. valisneri*, Switzerland.

FERTILISERS. Common. We do not recognise the names, which may be proprietary fertilisers.

MARKET GARDENING. W. H. Before deciding on the crops to grow you should consider your market. The one-acre kitchen garden and three vineries, although presumably the latter are heated, are not sufficient to enable you to send to a market the regular large supplies which the salesmen prefer, and which are more profitable.

For this reason it would be well to ascertain the probabilities of selling your produce locally, as then smaller quantities could be disposed of at remunerative prices. You would also save expenditure on packing, carriage and commission. We do not think it wise to clear the vines from all three vineries, and advise you to leave the roots in one house, if possible, of such varieties as Black Hamburg, Marlband, Sweet Water, Gros Maroc and Foster's Seedling, as they may be grown with a minimum of fire-heat. If the other vineries are light, Tomatos could be grown in them, but provision for abundant ventilation is essential. Unless you already have sprouting tubers of such early Potatos as May Queen, Sharp's Victor, Myatt's Ashleaf, or Eclipse, we doubt if a crop of early Potatos could profitably precede the Tomatos, but you could experiment with one house, and if you correctly anticipate the lifting of the crop and have the Tomatos planted without delay they should yield a fair return. Last year late Tomatos paid well. As to the advisability of following Tomatos with Chrysanthemums lifted from the open, this is purely a matter of conjecture at present. The demand for cut flowers fluctuated exceedingly towards the end of last year, and it is well within the possibilities that requirements in the near future will be small, so in this you must form a decision after ascertaining local possibilities. The best sorts for the proposed method are: Mid-season varieties—Batchelor's White, Black Prince, dark red, Freda Bedford, bronze, H. W. Thorp, incurved white, Hortus Tolosanus and Jessie, golden bronze, Josephine Bernier, deep pink, Mrs. W. Kerr, deep yellow, Romance, rich yellow, and Wells' White; late varieties—Baldock's Cimon, Champion Exe, white, December Pink, Lord Brooke, orange-yellow shaded bronze, Nagoya, deep yellow, Pink Exe, Yellow Queen of Exe (both are sports from Queen of Exe), Tuxedo, bronze, and Yellow Brooke. As to other crops which you might grow profitably, we feel that it would not be wise to attempt to compete with the large growers of the commoner vegetables, but rather to confine yourself to those choicer vegetables of which you already have experience and knowledge. For instance, you might consider the possibility of specialising in salads and determine to supply these in regular, if at times small, supplies all the year round. There also is money to be made by selling seedling vegetables at the various seasons. At the moment you could start by sowing Onions, Leeks, Cauliflowers, Brussels Sprouts and Lettuce in gentle heat. Tomato plants in small pots, and also pricked off in boxes, usually find a ready sale from the latter part of April and throughout May. For the market garden side of your establishment you would require the whole-time help of a man and a boy and at least another man to keep the flower garden tidy.

NAMES OF PLANTS. C. B. P. 1, *Cypripedium Spiciferum*; 2, *Cypripedium Littleham* (*Lavreocanum* × *Davayum*); 3, *Cypripedium Bossianum* (*tonsum* × *barbatum*); 4, *Cypripedium Lecanum* (*insigne* × *Spiciferum*); 5, *Cypripedium actaeus* (*insigne* × *Lecanum*); 6, *Cypripedium Lander* (*Lecanum* × *villosum*).

PEAS FOR DRYING. Wessle. Suitable varieties for the purpose are Fillbasket and Bountiful. The amount of seed required per acre is three bushels.

Poultry MANURE. H. L. Poultry manure is a rich fertiliser; it should be dried thoroughly, mixed with fine soil, and applied as a surface dressing, lightly forking it in. Apply it to the Asparagus bed just before growth commences in the spring.

SOFT PORTING SOIL. W. P. H. The softness is due to acidity, which may be corrected by mixing lime freely with the compost. Besides sweetening the soil the lime will supply a valuable plant food.

MARKETS.

CUT FLOWERS.

Table listing various cut flowers such as Arums, Azalea, Bouvardia, Camellias, Carnations, etc., with prices in s.d. and s.d.s.d.

Table listing cut foliage such as Ailanthum, Asparagus, Carnation foliage, etc., with prices in s.d. and s.d.s.d.

Table listing French flowers such as Anemone, Lilac, Mimosa, etc., with prices in s.d. and s.d.s.d.

Remarks: This was an excellent day for cut flowers and foliage during the week as work on the scenery has been up to the (P) level, meaning inland prices for cut flowers are rising. The home trade and industry of Florists have given the market an advance in some spots. The main shipments of Lily of the Valley, Rock-rose, Anemone, and Mimosa have come out from the demand and white and pink Lilac foliage are most plentiful in the home market. It is considered a very high price for quality foliage, but it is still a limited supply and their prices remain firm. A few bunches of these plants have arrived from Canada, also, but they are not of the quality of the first shipment of France for the season and the market on Monday Day from Germany, the flowers were very good. White and pink Azalea are still in good supply, but they are not of the quality of the first shipment, especially Asparagus and Mimosa (Maidenhair). The latter plants are being received in good quantities. White and many colors are being received in good quantities.

Table listing plants in pots such as Aralia, Asparagus, Aspidistra, etc., with prices in s.d. and s.d.s.d.

THE WEATHER.

The 12th of January was a very cold and abundant day, with a heavy snowfall. The temperature was very low, and the wind was very strong. The weather was very cold and abundant, with a heavy snowfall. The temperature was very low, and the wind was very strong.

DEBATING SOCIETIES.

BATH GARDENERS. The 29th session of the Bath Gardeners' Society was held on Monday, the 9th inst., with a lecture by Mr. F. R. Jones, Horticultural Officer at Reading University College. Mr. Jones dealt with the subject of the soil, and the effect of the soil on the growth of the plants. He recommended that the soil should be well prepared, and that the plants should be well watered. He also recommended that the soil should be well prepared, and that the plants should be well watered.

WANTED, immediately, Two WOMEN GARDENERS, chiefly for Plants, furnished cottage, private roads and vegetables.—Particulars to MR. TURNER, Danbury Park gardens, Welwyn, Herts.

WANTED, Two WOMEN GARDENERS under Head, some experience Inside and Out. Apply, stating wages and particulars, to HEAD GARDENER, Earham, Chichester.

WANTED, Two LADY UNDER GARDENERS for Inside and Outside work, some experience necessary, Bothy, vegetables and attendance. Apply, stating full particulars of experience, wages required, &c., to W. WILCOCKS, Langley Park Gardens, Slough.

WANTED, Two WOMEN GARDENERS (EXPER.) for general work, some experience cottage and coal. Apply, with full particulars stating wages required, to MRS. CHAMRD, 69, Grosvenor Street, London, W.

WANTED, FEMALE UNDER GARDENER for Pleasure Grounds and take turn Sundays and week evenings, in charge of Glass-houses and fire, wages 15s. per week, light, coal, &c.; when in charge of House, 5s. extra, overtime 6d. per hour; Saturdays 1 o'clock, 7 in Bothy. Full particulars to H. R. WHITEHEAD, Hever Castle Gardens, Hever, Kent.

WANTED, for a Nobleman's Establishment, a First-class FOREMAN (eligible for the Army), wages 30s. per week, Bothy. Apply to GLEESON & CO., 41, High Street, Watford, Herts.

WANTED, FOREMAN, for Houses; good wages and house for suitable man.—CHAS. B. ELLIOTT, Blyth Hall, Rotherham.

WANTED, FOREMAN, JOURNEYMAN and a good IMPROVER for the House, also a good man to take the lead Outside; good wages and Bothy (or cottage to married men). Apply, H. FISHER, Rutchurch Court Gardens, Hereford.

WANTED, UNDER FOREMAN and Indoor Fruit and Plants. Wife carrying references and wages required, to F. H., Box 18, 41, Wellington Street, Covent Garden, W.C.

SEEDS FOR 1917.

It is none too early for garden-lovers to think of seeds, but be sure the seeds you buy are seeds of quality. It is a gardening axiom that

RYDERS SEEDS

are the best, and despite the fact of a War Time price of 13d. per packet, orders for these famous Flower and Vegetable seeds are daily growing in volume. Seeds of quality cannot now be supplied, even by Ryders, in Penny Packets.

Ryders Illustrated Seed Catalogue Free.

Ryders 1917 Catalogue contains a large number of choice varieties not found in other lists.

- Novelties for 1917 include the New Pierce Sweet Peas (Pink, Pale Blue and Violet).
- A wonderful new strain of Hybrid Cinerarias. The "Asterum" in four lovely colours.
- New Cyclamen, Mauve Queen.
- New hybrids of Trollius.
- "Britain's Best" Tomato. The finest Tomato ever introduced.

- Ryders New Snow-tail Scarlet Radish, remarkable new Three-pedded Pea "Thousandfold."
- A splendid New Oval-shaped Beet.

Send a post card today for your free copy of Ryders Catalogue. Remember the one and only address and beware of imitators, no agents.

POTATO CULTURE IN EIGHTEENTH AND TWENTIETH CENTURIES.

THE daily newspapers are printing every day letters and articles on agriculture and horticulture, and the majority would be far better consigned to the wastepaper basket. It is sheer madness to suggest, as many of these writers do, that all that is required to be done is to dig up a lawn and plant Potatos or vegetables and Hey, presto! there will be a wonderful crop. I hope the Editors will reprint some remarks which I have taken from an old treatise on Potato growing. It shows clearly, and conveys a lesson, much needed to-day, that results can only be achieved, and may I add they only deserve to be achieved, as a result of thorough, understanding work.

I fear our new Food Dictator has made a most unfortunate start in his attempt to handle the Potato problem. Very many gardeners, as well as farmers, are interested in this crop as they have often to cultivate large areas outside their gardens. Will the prospect of £5 15s. per ton induce them to go heartily into the business of Potato growing? Never under present conditions. I know what we have to pay in the Lothians to get Potatos grown. Never less than £15 per acre to the farmer and we have to provide the seed and artificial manure. Now seed Potatos this year are worth to the farmer £12 to £15 per ton. Just figure

out £15 for land, labour, manure, straw and dressing, £5 for artificial manure, £15 for seed makes a total of £35. This means that the grower would require to get a crop of nearly seven tons of "first quality in sound marketable condition," to use the Food Controller's own words, before he would be able to meet his outlays. To obtain this a gross crop of something approaching ten tons per acre would have to be grown! Where is the inducement to embark on Potato growing! Where is the encouragement to the farmer to put down more land to Potatos! I fail to see it.

It is pleasanter to turn to the old treatise I refer to at the beginning.

"Hints for encouraging a more extensive and beneficial culture of that most useful of all roots, The Potato," is the title of an 8-page pamphlet. It is the report of a lecture delivered to the Right Honourable the Dublin Society in February 1771 by John Blackhall, Gent., of the County of Armagh. There is an introduction of 2 pages and two plans occupying one page.

In the introduction the writer hits out strongly against the lazy-bed system as follows: "But as is now well known, that the cultivation of Potatos in the Old, Irish, Lazy-bed way is so very slovenly and imperfect that it doth not yield above one-fourth Part of the Crop, which the Land under a spirited and rational Culture would produce; it is therefore most humbly recommended to this truly patriotic Society, to encourage the Culture of Potatos, upon the new and most improved Norfolk Plan, by the Dibble and Hand-hoe by the distribution of Premiums to each county."

What is termed the Norfolk Plan is a most thorough one and reminds one of the method practised by the growers in South Cornwall, who plant Potatos in finely prepared ground in February and raise good crops in June. Let me quote.

"To prepare the Land for the reception of Potatos in this way, the best and most effectual Method, would, no doubt, be trench digging, but that would be far too expensive and tedious upon a large Scale, plain digging also would be very beneficial, but attended with too much Expence to be adopted into general Use; the Method therefore, which from my own Experience, I would recommend to the Publick, would be as follows: In the Month of October draw out your Manure (the shorter and older the better) and spread it lightly, and as equally as possible on the whole surface of the ground intended for Potatos, and immediately Plough it in, as deep as you can, leaving it in high Fallows for the Winter; early in February, as soon as the Weather will permit, stir it again cross ways, as deep as before, and let lye for ten Days or a Fortnight, to catch the little Frosts, that are not then uncommon, then stir it a third Time from Angle to Angle (and if time will permit give it a fourth ploughing from the opposite Angles), between each of these Stirrings you are to Harrow it as level as possible with a

good, heavy, Two-horse-harrow; after this Plough it Lengthwise into broad Lands or Beds Sixteen Feet wide, observing to shape them in such a Direction as that the Water may have a fall by the Furrows, so as to drain off any superfluous Moisture; after this last Operation you are not to Harrow it because while the Land lies thus high and loose the Dibble will perforate with much more ease and expedition than when it has acquired a certain degree of Solidity from the treading of the Horse and Weight of the Harrows. Your Ground now being prepared get ready your Dibles." (Long dibles about 3 feet long with a foot-rest for purchase, such as are used to-day by allotment holders in the Eastern Counties of England.) By the use of these dibles the sets were planted in lines across the sixteen feet wide beds. Let me quote again. "If the Land hath been truly ploughed and not slovened over as is too frequently the Case, each Dibble being followed by a Boy to drop in the Sets as fast as Holes are made; so soon as the Lands or Beds are filled, give them a good Harrowing up and down to cover the Sets well; Eight Dibblers will in this Manner set with great Ease an Irish Acre in one Day. Nothing more is required 'till your Plants are all fairly above Ground than set in your Hoers, and see that they Hoe it deep and all equally alike so as to let the Ground lie as hollow and loose as possible. Every sort of Weed turned up by the Hoers should be carefully picked up by Boys following them, and cast off into the Furrows, and they should at the same Time be directed to cast off also the Stones, as by their gravity they condense and consolidate the Earth and prevent the Plant in a great measure from extending and spreading its tender Roots. If the Ground has been effectually ploughed so that the Sets had penetrated to a sufficient depth there will be no Occasion to draw up any mould to the Plants, otherwise a little Earthing may be useful. . . . The second Hoeting will give much Vigour to your Plants that by the luxuriance of their Branches they will keep down all fresh growth of Weeds and leave your Land as clean as an Hot-bed." Result: "Forty forkmen will be amply sufficient in one Day to dig and gather the Potatos of an Acre Plantation Measure and that Acre will be poor indeed, if you do not get Six Hundred Bushels from it, but it more probably will yield Seven, Eight or Nine Hundred Bushels. I have myself raised this year (1773) above Six Hundred Bushels (about 15 tons) from a bare English Acre, with this additional Advantage, there is no Part of it that would not grow Onions."

Such is a very condensed account of Mr. John Blackhall's methods, in the year 1773, in the County of Armagh.

We may smile at them, and at the quaint way of giving expression to them, and we may be certain he had no labour troubles such as we have at the present time, but nevertheless, there is certainly much food for thought in his written word. *W. Cathbertson, Duddingston.*

ORCHID NOTES AND GLEANINGS.

BRASSO-LAELIO-CATTELEYA RUMANIA.

A FLOWER of this remarkable large and beautiful new hybrid between *Brasso Cattleya Digbyi* and *Mossiae* var. *Queen Alexandra* and *Laelio Cattleya Canhamiana* alba is sent by Mr. Jas. Smith, Orchid-grower to the Duke of Marlborough, Blenheim Palace, Woodstock, where the Orchid collection has been prolific in pretty new hybrids during the past year. Both the parents are white forms, and the hybrid follows in that respect, the segments being pure white. The lip has a bright yellow disc, and at the base is a purple patch with yellow veining, which, with the outline of the front lobe, appears to be inherited from *C. Mossiae*. The long pedicel and ovary and the firm texture of the flower approach nearer to the primary parent *Brassavola Digbyana* than either of the parents. The flower is 9 inches across, and the lip well displayed and fringed at the margin. The plant is said to be in a 4-inch pot, and to produce such a flower in these circumstances augurs well for its future when grown into a large specimen.

vanilla, and are sometimes produced by plants in this country. Other species in cultivation are *V. Phalaenopsis*, *V. Pompona*, and *V. africana*. The plants are not difficult to cultivate, and may be grown in Palm houses, or trained along the roof of the warm Orchid houses, where the stems often attain a great length, rooting freely as they extend. The plants should be grown in a mixture of *Osmunda*-fibre, or peat, and *Sphagnum* moss, and a piece of bark may be used to give the plants a start. Throughout the growing period they need to be syringed freely, and the atmosphere kept fairly moist. During winter, when the roots cease to elongate, spraying should be discontinued, and the atmosphere kept drier. To secure seed-pods, the flowers should be pollinated, and until they are set, and the fruits swelling, no water should reach the upper part of the plant *B*.

ASTELIA BANKSII.

ASTELIA BANKSII (see fig. 9) is very rare in private establishments. The plant, which re-

able for table decoration, and the leathery character of the leaves should be resistant to the dry atmosphere of rooms. Mr. Dixon, the gardener, has been nursing the plant to its present size for some years. *J. P.*

THE MARKET FRUIT GARDEN.

MANY people in addition to myself rejoiced to see the end of the past year, which was a particularly unpleasant one during the greater part of its course. December, 1915, was one of the wettest on record (8.13 inches at my station), and we had the usual dismal weather in January, with rain on fourteen days, but not a great quantity—only 1.49 inch. February gave us rain on twenty-two days, amounting to 4.67 inches, with a good deal of snow in its last week. Rain fell on nineteen days in March, totalling 2.74 inches, and there was a regular blizzard on the 27th, with snow and frost to follow. April and May were the pleasantest months in the year, with more sunshine than we had in the first two summer months. Rain was measured on only twelve days in April and eleven in May, making 1.48 inch for the former month and 2.07 inches for the latter. June was an unseasonable month, with seventeen rainy days, contributing 2.65 inches. The nights were mostly very cold for the period of the year. The sky was overcast on most days in July; but there were only eight rain days, giving 0.85 inch—much less than any other month's total. The only spell of hot weather occurred in the last four days of July and the first three of August. In the latter month rain was measured on only nine days, the total fall being 1.63 inch. There was much cloudy weather in September, but only the moderate rainfall of 1.52 inch, measured on ten days. The weather of the rest of the year was generally allowable, rain being measured on twenty-one days in October, fourteen in November, and fourteen in December, while the totals were 5.47 inches, 4.88 inches, and 4.44 inches. The year's totals were 171 rain days and 33.90 inches of rain. The former total was equalled or exceeded only once in the fifteen previous years of my residence in my present place, namely, in 1903, when there were 181 rain days. The year's rainfall was exceeded in 1915, 36.50 inches; in 1909, 34.54 inches; and in 1903, 37.16 inches. My averages for sixteen years stand at 150 rain days and 29.86 inches. The fall has been annually above average for the last eight years in succession. I am longing for a period of sunny, warm, and comparatively dry years, and much more frost in the winters than we have had lately is desirable. Even drought is less harmful than flood in my district, as the former checks the fungous diseases of fruit trees which have been fostered to a disastrous extent by the last eight more or less wet years.

SHORTNESS OF LABOUR ON FRUIT FARMS.

SEVERAL results can hardly fail to be experienced in consequence of the shortness of labour in the orchards of this country. In many cases it will be impossible to do all the pruning that should be done, and fruit trees will suffer from the unavoidable neglect of this important work. Similarly, if the war lasts through the spring, the usual extent of what is called winter spraying will be impracticable. This is all the more to be regretted on account of the extraordinary development of moss on the trees, as the result of the prolonged period of very wet weather. Much of the usual digging, too, will necessarily be omitted. Half the members of my regular staff of men have been taken from me, and the extra hands for digging and spraying, usually available are lacking.

SEARCHING FOR APHIS EGGS.

Since my remarks on page 301 were written further searches for aphis eggs have been carried out in my orchards, with the help of a good lens; and, up to the time of writing, no eggs have

FIG. 9. *ASTELIA BANKSII* WITH MALE FLOWERS.

ODONTOGLOSSUM BRONLET

THIS new *Odontoglossum*, which was raised by C. J. Phillips, Esq., The Glebe, Oak Lane, Sevenoaks, between *Odontoglossum Nathanieli*, a richly colored hybrid of unrecorded parentage, bearing large, clear red flowers with white margins (see *Gard. Chron.*, August 31, 1912), and *Odontoglossum Jasperi*, was included in the list of hybrid Orchids published in these pages on December 23, page 500, as *Odontioda Bronletii*, and *Odi Jasperi* was given as one of the parents, instead of *Odontoglossum Jasperi*. The use of *O.* as an abbreviation, which might apply to either *Odontoglossum* or *Odontioda*, often leads to trouble in recording, and *Odm* and *Odi* for *Odontoglossum* and *Odontioda* respectively are much better. The seed from which *Odontoglossum Bronletii* was raised was sown on September 17, 1913, and the plant flowered on December 15, 1916. It is nearest to the finely colored *Odontoglossum Nathanieli*.

THE VANILLA IN HOT-HOUSES.

The fragrant, succulent fruits of *Vanilla planifolia* (see fig. 10) are the source of commercial

scabrous, rigid *Luzula*, belongs to the *Liliaceae*, and takes its place amongst native vegetation in New Zealand, much in the same way as *Luzula sylvatica* does in some parts of this country. It forms a great part of the undergrowth of wooded headlands along the sea coast of the northern half of the North Island, New Zealand, from sea level to an elevation of 2,500 feet. There the leaves vary in length from 2 feet to 6 feet, according to the fertility of the soil. It has flowered twice at Holland House, Kensington, namely, in November, 1915, and again in December last year. Grown in a pot, the leaves do not exceed 2½ feet, and, while densely arranged, assume a graceful, spreading or arching outline. The upper surface is dark green and shining, and the lower is covered with a thin silvery peltate. The illustration represents the middle form of the plant, bearing a large panicle of pale yellow flowers. The slender branches of the panicle are often flaccid owing to the shortness of the flower stem. The very short stem of the plant is triangular, but completely covered by the broad sheathing bases of the leaves. Young plants would be very suit-

been found except on the few trees of James Grieve Apples already mentioned. Many varieties of Apples have been examined, and two hours were spent in hunting for eggs on Monarch Plums (always the first to be infested) in two orchards, also with negative results. Mr. Blakey wishes to know if I have had forty years' training in searching for eggs. The reply, in House of Commons fashion, is "in the negative." But does he seriously contend that such plainly visible things as the black and shining eggs of the aphid cannot be found by anyone who has not had forty years' experience in looking for them? Could he not train in half an hour any intelligent person to search for these eggs? During the last two seasons two assistant pruners, young men with good eyesight, have been instructed to look out for aphid eggs, and they, like myself, have found the eggs in only extremely rare instances. Now, the existence of eggs on a tree or two among acres of trees does not account for the sudden and simultaneous aphid infestation frequently observed in my orchards, as the stem-mothers are wingless, and it is not in the slightest degree probable that they would walk long distances on the ground in order to ascend a tree far from the one on which they were hatched. More than once I have had a bad infestation of the Plum aphid a week after the trees had been examined carefully for eggs and stem-mothers, with entirely or nearly entirely negative results. This is a complete mystery to me, and I have no explanation to suggest. The only plausible explanation at present known is that an infestation arises from eggs laid on the trees, and yet I have had bad infestations on groups of trees upon which no eggs could be found in a careful and prolonged examination. In my recent searches multitudes of the tiny red eggs of the beetle mite, *Oribata lapidaria*, as well as great numbers of sucker eggs, were found on Apple trees, while the eggs of the red spider were seen to be extremely numerous on some Plum trees. Do not these facts prove that my failure to find aphid eggs on groups of trees usually attacked by that pest is not due to careless examination? *Southern Grower*.

This is a very distinct and constant species with oak-like leaves; its nearest ally is *O. stellulata*.

- 5. *Olearia stellulata*, DC., *Prodr.*, v. 272 (1836). Benth. *Fl. Austral.*, iii., 475, partly.
- Aster stellulata*, Labillard., *Fl. Nov. Holl.*, v., 50, t. 196 (1806); *Eurybia fulvula*, Cass., in *Diät. Soc. Nat.*, xvi., 47 (1820); *Diplostegium stellulatum*, Nees, *Gen. et Sp. Aster.*, 187 (1852).

Distrib.—New South Wales: alluvial woods near Port Macquarie; Backhouse, banks of the Hastings River, Fraser 214; Hunter's River, Herb. R. Brown, without definite locality; R. Brown 2008, 2011; Tasmania: shores of Macquarie Harbour, Cunningham 118 without precise locality; Bauer.

Leaves (> fig. 1) lance-ovate or linear-lanceolate, acutely acuminate, usually about 7.9 cm. long and 1.2 cm. broad, more or less rigidly but thinly chartaceous, coarsely repand-dentate, mostly somewhat shining and impressed reticulate on the upper surface, yellowish tomentose below; flower-heads either small in panicle-clusters at the ends of the branches, the peduncles slender and filiform.

Leaves and flower-heads almost exactly as in typical *O. Gunniana*, but the peduncles very short and leafy, and the heads somewhat hidden among the leaves.

- 6b. *Olearia Gunniana*, var. *philogoppappa*, Hutchinson, new var. comb.

Distrib.—Tasmania: Recherche Bay, Dec., 1838, Gunn 1144, Port Arthur, Oct., Hooker; Eagle Hawk Neck, Gunn 1152, "New Holland," Webb.

Aster philogoppappus, Labillard., *Nov. Holl.*, ii., 49, t. 195, A. (1806); *Eurybia openifolia*, Cass., in *Diät. Soc. Nat.*, xvi., 47 (1820); *O. philogotrichum*, Nees, *Gen. et Sp. Aster.*, 187 (1852); *O. philogoppappa*, DC., *Prodr.*, v., 272 (1836); *Eurybia Gunniana*, var. *philogoppappa* and *scabrifolia*, Hook. f., *Fl. Tasm.*, 176 (1890).

Leaves similar to those of the typical form, but broader and much more coarsely repand serrate; flower-heads and peduncles as in var. *brevipipes*.

In regard to the leaves, this variety approaches *O. stellulata*, but they and the peduncles are

FIG. 10. FRUIT OF *VANILLA PLANIFOLIA* (See p. 22)

OLEARIA GUNNIANA AND ITS ALLIES.

(Continued from p. 11)

SUMMARY.

- 3. *OLEARIA FLAVESCENS*, Hutchinson, new sp. *O. stellulata*, Benth., *Fl. Austral.*, iii., 475, partly. Distrib.—Mt. Barkly, 5,000 feet, Jan. F. Mueller. Leaves linear-oblong, obtuse, 2.5 cm. long, 1-1.5 cm. broad, green, and impressed reticulate above, glabrous, rather densely yellowish tomentose with stellate hairs below; flower-heads on long and rather stout peduncles arranged in leafless clusters. Closely allied to *O. Gunniana*, but with larger entire or subentire leaves, much stouter peduncles, and quite glabrous achenes.
- 4. *Olearia quercifolia*, DC., *Prodr.*, v., 272 (1836); *Aster quercifolius*, Sieber, ex Benth., *Fl. Austral.*, iii., 475, name only (1836); *Olearia stellulata*, var. *quercifolia*, Benth., *l.c.*, 473, partly. Distrib.—New South Wales. Blue Mts., Sieber 340 (type); boggy situations within the influence of the mist rising from the Campbell Cataract, Blue Mts., Cunningham 4, Pitt's Amphitheatre, Fraser; Australian Alps, F. Mueller. *Olearia flavescens*, Hutchinson, sp. nov., frutic., ramis bignoniis subterribus, minute tomentellis, foliis oblongo-linearibus, utrinque obtusis vel basi subacutis, 2.5 cm. longis, 1.1-1.3 cm. latis, rigide chartaceo-integris vel minus et remote denticulatis, supra glabris, siccis viridatis et aetate impresso-reticulatis, infra pilis stellatis dense flavo-tomentellis, costa supra impressa, infra valde prominente; nervis laterales infra breviter conspicuis, petioli 4.5 mm. longis; capitula longe pedunculata in corymbosis subsilencibus disposita, pedunculis usque ad 3 cm. longis, foliatis tomentosis, involucris bracteae 3-seriatis, linearis, extra parvo tomentellae; achenia glabra.

- Olearia Gunniana*, Hausskn., *Bot. Mag.*, t. 4658 (1852). *Eurybia Gunniana*, DC., *Fl. Atl.*, v., 263 (1836); Hook. f., *Fl. Tasm.*, 175, incl. var. *longipes*, Hook. f. (1860); *Olearia stellulata*, Benth., *Fl. Austral.*, iii., 475, partly (1836). Distrib.—Tasmania: Clifton Surrey Hill, Feb. 1837, Gunn 180; North Esk, Penzance, Nov., 1843, Gunn 26; Furness Garden, Nov. 1843, Gunn 26; without definite locality, R. Brown 2013. Flowering branchlets often corymbose; leaves more or less linear-oblong, the majority 1.5-3 cm. long, about 0.5 cm. broad, distinctly repand dentate or undulate-dentate, glabrous or nearly so and petiolate above, greyish-tomentose below. Flower-heads more or less corymbose on very slender leafless peduncles 2.5 cm. long, well overtopping the leaves; achenes, as also in all the following varieties, pubescent.
- 6a. *Olearia Gunniana*, var. *brevipes*, Hutchinson, new var. comb. *Eurybia Gunniana*, var. *brevipes*, Hook. f., *Fl. Tasm.*, 176, t. XIV, A. Distrib.—Numerous localities in Tasmania.

- much shorter than in that species; in some respects it is almost intermediate.
- 6b. *Olearia Gunniana*, var. *microcephala*, Hutchinson, new var. comb. *Eurybia Gunniana*, var. *microcephala*, Hook. f., *Fl. Tasm.*, 176. Distrib.—Tasmania: Eagle Hawk Neck, Oct., Hooker. Leaves as in typical *O. Gunniana*; peduncles as in var. *brevipes*, but flower-heads very small, only about 1 cm. in diameter when spread out.
- 6c. *Olearia Gunniana*, var. *angustifolia*, Hutchinson, new var. comb. *Eurybia Gunniana*, var. *angustifolia*, Hook. f., *Fl. Tasm.*, 176, t. XIV, B. Distrib.—Tasmania: Risdon, near Hobart, Oct., 1840, Gunn 1136. Leaves linear, 1.5-2.5 cm. long, 5 mm. broad or less, obtuse, entire or obscurely undulate; peduncles rather short, leafy to the apex as in var. *brevipes*.
- 6d. *Olearia Gunniana*, var. *salicifolia*, Hutchinson, new var. comb. *Eurybia Gunniana*, var. *salicifolia*, Hook. f., *Fl. Tasm.*, 174. Distrib.—Tasmania: York Town, Jan., 1843, Gunn 1,255.

Leaves elongate-linear, acutely acuminate, 4-5 cm. long, entire; peduncles long and slender and almost leafless as in the typical form.

7. *Olearia rugosa*, Hutchinson, comb. nov.
Eurybia rugosa, F. Muell. ex Archer in *Journ. Linn. Soc.*, v., 22 (1861); *Olearia stellulata*, var. *quercifolia*, Benth., *Fl. Austral.*, iii., 475, partly (1866).

Distrib.—Victoria: Victoria Ranges, Wilhelm in Herb. Oldfield; Wilson Promontory, without collector in Herb. Kew.

8. *Olearia subrepanda*, Hutchinson, comb. nov.
Eurybia subrepanda, DC., *Prodr.*, v., 268 (1836); *Eurybia Gunniana*, var. *rana*, Hook. f., *Fl. Tasm.*, 176, t. xlv., C; *Olearia stellulata*, Benth., *Fl. Austral.*, iii., 475, partly (1866).

Distrib.—Tasmania: sides of the Mts. 3,000 feet, Feb., 1888, 273; without precise locality, Hooker.

—J. Hutchinson, Kew.

NOVELTIES OF 1916.

(Concluded from p. 2.)

AN examination of the list of Awards made by the committees of the Royal Horticultural Society shows that there has been no falling off in general interest in the past year, though the plants have flowered and made their debut under exceptional conditions.

Carnations and Roses vie with each other for the position of first favourite amongst lovers of beautiful and fragrant flowers, and in the matter of the tiny over which they produce their flowers the Carnation, which has well earned its name of Perpetual-flowering, cannot be beaten. Scarcely any show throughout the year of any importance was without a display. The last and one of the best demonstrations of the year was at the Royal Horticultural Society on December 5 and 6, the latter date being that of the Perpetual-flowering Carnation Society's show.

Roses also as now grown have a much longer season than formerly, and most classes have been recruited with sterling novelties during the past year. As a favourite plant for garden cultivation the Rose excels all others in the wide range of variety which it presents, the range extending from the small but always pretty species through many grades leading up to the highly developed Hybrid Perpetual and Tea Rose of the florist, and that great beautifier of the garden, the Wichuraiana class.

Chrysanthemums and Dahlias worthily hold their votaries, who fail not with good novelties, although the old favourites in many cases are not deposed. The feature in these and other florists' flowers is the increased favour with which beautiful single forms, and unconventional decorative flowers, are regarded. This comes from the natural form being more appreciated by educated taste, and leaves one wondering where that taste was in the early days of Dublin-raising when nothing but the globular head would pass and the single and decorative seedlings were thrown away on flowering.

Stove and greenhouse plants, as collections both in nursery and private gardens, have not been so much in the public eye as formerly, except such kinds as grow well for decorative purposes. This is to be regretted, for batches of florists' plants can never be so interesting as a collection including species.

Narcissi and Irises are greater favourites than ever, for both are as acceptable in the cottage garden as in the more lavish displays in country estates. For the florist the Narcissus is one of the best and most profitable flowers.

New and rare shrubs have taken a strong lead during the past year, and acquisitions have been shown in the collections of the Hon. Vicary Gibbs at Aldenham, where he skillfully acclimatizes so many valuable kinds. The new importations from China, indeed, are now widely distributed in gardens.

Hardy herbaceous and rock plants, so attractively displayed in model rockeries at the R.H.S. shows, are among the most admired exhibits.

The following novelties and rare plants flowering under noteworthy conditions, have, amongst others, been illustrated in the *Gardeners' Chronicle* in 1916:—

Acacia Baileyana, April 29, p. 232.
Abies bracteata, January 15, p. 40.
 Apple Charles Ross, October 14, p. 180.
 Apple Lord Kitchener, July 22, p. 45.
 Apple Lord Hindlip, December 23, p. 500.
 Apple Orleans Reimetz, January 22, p. 52.
Aralia chinensis albo marginata, November 13, p. 245.

Aster Purdomii, June 24, p. 350.
Aster stactifolius wild in China, September 2, p. 116.

Begonia manicata crispata, March 11, p. 146.
Berberis rubrostilla, November 11, p. 236.
Bidens Beckii, June 10, p. 305.

Campanula acutangula, September 9, p. 120.
Campanula caespitosa alba, November 25, p. 257.

Campanula caespitosa Miss Willmott, November 5, p. 253.
Campanula Celsii, April 22, pp. 219-220.

Campanula persicifolia Telham Beauty, August 19, p. 89.

Campanula garganica var. W. H. Paine, September 9, p. 119.

Campanula Raddiana, September 9, p. 125.
Campanula Zovsii, June 24, p. 356.

Castilleja miniata, July 8, p. 10.
 Carnation Sweet Ann Page, June 5, p. 296.
Cephalotus follicularis, April 1, pp. 182-183.

Cestrum fasciculatum, June 24, p. 340.
Clematis Crimson King, June 5, p. 301.
Clematis, blue, in China, January 22, p. 40.

Colchicum Decaisneii, October 28, p. 204.
Colletia armata, November 4, p. 225.
Colletia cruciata, dimorphic, September 2, p. 109.

Collifolia infansta, September 16, p. 132.
Cotula myriophylloides, June 10, p. 305.
Cupressus obtusa, May 27, p. 278.

Cupressus pisifera, January 29, p. 58.
Cupressus thoides, August 19, pp. 84-86.
Crinum lineare, August 19, p. 91.

Dahlia coccinea, September 2, p. 108.
Dahlia E. Edina, September 2, p. 107.
Dibsanandra lanuginosa, October 28, p. 205.

Delphinium Ikiangense, September 9, p. 128.
 and September 23, p. 151.

Dipelta floribunda, July 22, p. 38.
Erigeron heteromorphus, June 10, p. 306.
Eucharis Dorend Sprengii, July 8, p. 17.

Eucharis Lowii, March 25, p. 175.
Fokienia Hodgkinsonii, February 5, pp. 72-73.
Garrya elliptica in fruit, November 25, p. 254.

Grape Cooper's Black, March 11, p. 142.
Grapes Trebbiano and White Nise, October 7, p. 177.

Houttuynia coriata, March 25, p. 170.
Isoopyrum grandiflorum, Feb. 5, p. 77.
Iris ensata (I. t. t.), April 3, pp. 194-195.

Iris Hoogiana, November 4, p. 216.
Iris Richard II., July 1, p. 5.
Iris Rosenbachiana, March 18, p. 155.

Iris umifolia, April 8, p. 196.
Kniphofia confusens, July 29, p. 56.
Kniphofia Northiae, July 29, p. 52.

Lilium giganteum vancouverense, July 29, p. 50.
Lilium Roelzii, January 22, p. 44.
Lobelia Gregoriana, March 4, p. 127.

Lobelia Teleki, March 4, p. 126.
Lonicera Griffithii, July 22, p. 43.
Meconopsis racemosa changing to *M. horridula*, February 12, p. 86.

Meconopsis simplicifolia Bailey's var., June 10, p. 313.
Megacarpus nolvandra, May 13, pp. 255-256.

Meliosma canifolia, May 27, p. 279.
Monocharis pardanthina, June 10, p. 314.
Montanoa bipinnatifida, March 11, p. 152.

Nuthallia macrophyllum, May 20, p. 265.
Olearia semi-dentata, June 24, p. 357, July 1, p. 1.

Pyraecantha crenulata var. *Rogersiana*, December 30, p. 312.

Pyraecantha Gibbsii, December 30, p. 310.
Pectis aquatica, June 10, p. 306.

Phlox Douglasii, January 29, p. 63.
 Plum, cross-bred (Laxton's), October 7, 169.
Primula blattariformis, May 13, p. 254.

Primula conspersa, May 27, p. 266.
Primula helodoxa, May 27, p. 291.
Primula nutans, May 13, p. 262.

Primula sibirica in China, January 22, p. 45.
Primula silvicola, June 17, p. 318.
Primula Zuleika, Dobson, April 15, p. 213.

Pyrus cataegifolia, fruit and foliage, January 1, p. 7.
Ribes Maximowiczii, May 20, p. 273.

Rosa sericea, July 15, p. 26.
 Rose Alexander Hill Gray, December 16, p. 288.

Rose Emily Gray, August 5, p. 62.
 Rose Janet, July 29, p. 58.

Rose Flame of Fire, August 12, p. 79.
 Rose Gladys Holland, August 12, p. 81.
 Rose C. V. Haworth, July 22, p. 39.

Rose Lord Kitchener, July 15, p. 53.
 Rose Lucy Williams, July 8, p. 12.
 Rose macrophylla Korolkowii, July 15, p. 28.

Rose Nellie Parker, July 8, p. 22.
 Rose Mrs. Bryce Allan, April 22, p. 223.
 Rose Princess Mary, November 18, p. 241.

Rose Hoosier Beauty, November 18, p. 247.
 Rose Queen Mary, February 19, p. 101.
 Rose Molly Bligh, May 27, p. 287.

Salvia Pitcheri, November 18, p. 243.
Silybia varlevisus, August 12, p. 78.
Saxifraga Rocheliana, March 4, p. 134.

Saxifraga Sumburmanii, April 1, p. 189.
Senecio laxifolius, November 11, pp. 228-229.
Stapelia Desmetiana, April 15, p. 211.

Streptocarpus cantabrigiensis, March 4, p. 131.
Streptocarpus denticulata, May 20, p. 271.
 Sweet Pea John Porter, July 8, p. 19.

Sweet Pea Old Rose, June 17, p. 523.
 Sweet Pea The President, July 15, p. 31.
Synthyris rotundifolia, February 19, p. 100.

Trollius pumilus in China, January 15, p. 30.

FRUITS UNDER GLASS.

By JAMES HUTTON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton, W.

PLUM TREES IN POTS.—After some twenty years' experience with Plums in pots both for early forcing and in natural conditions, I have come to the conclusion that this phase of fruit growing has not received nearly the attention its merits warrant. Given the same temperature and other cultural details as are accorded to the Peach and Nectarine, the growing of Plums in pots is equally satisfactory, and the fruits form a welcome addition to the select list of choice dessert kinds. In ordinary times I have commenced the forcing of Plums in the first week in December by merely closing the house and syringing the trees. A little fire-heat was used in the first week in January, and by the end of that month the first flowers would be open. The earliest varieties grown in this way were Early Rivers (or Early Profit), which, if not of the very best quality, is valuable for the earliest fruits, and, following closely upon this variety, Early Favourite and Saint. Before these three sorts are well over, Early Transparent Gage—a dessert Plum of the very best quality—is available (from the third week in May onwards). For years past I have never failed to obtain a crop of this choice Plum; the fruits set with freedom, and the tree has a robust constitution. Following those named are Jefferson and

Kirke's, which carry the supply well into July. Thence onwards the cold orchard-house will yield a supply, and, in addition to those named above, may be added Golden Transparent, Count Althann's Gage, Coe's Golden Drop, and Oullin's Golden Gage.

STRAWBERRIES IN POTS.—Strawberry plants in pots that have been prepared for forcing may now be placed under glass, with every prospect of good results. I am well aware that with many the orthodox time for starting Strawberries is at about the New Year, but those forced from now onwards will not be three weeks behind them, whilst the yield will be much more satisfactory. I have experimented in many ways, but have never found any better place for these early batches of Strawberries than on a shelf in either an early vinery or a Peach house, close to the roof-glass. I have tried them plunged in leaves in a frame, but the large amount of atmospheric moisture has favoured a too vigorous leaf growth. Royal Sovereign is the first choice of many, but I still believe in Keen's Seedling, both for reliability in cropping and high quality. Let the pots be examined as to the drainage and then be washed. Afterwards dip each plant in a mixture of sulphur (preferably the black variety) and water; the plant should be held head downwards sufficiently low down in the pail to just wet the surface of the soil. This will be a safeguard later from both mildew and red spider. Guard against extremes in watering, and take especial care in this respect in the early stages of forcing.

THE KITCHEN GARDEN.

By J. DEXS, Foreman, Royal Gardens, Windsor.

PARSNIPS.—This crop requires a deeply cultivated soil, and if the work has not already been done the ground should be prepared at the earliest opportunity in order that the seeds may be sown early in February. Select rich, loamy soil that is free from stones, and let it be broken up to the depth of 2 feet. Do not use farmyard manure at this stage, but give a good dressing of wood ashes, incorporating the ash thoroughly with the soil as the work of trenching proceeds. When the ground has become settled and sufficiently dry make the surface fine and level and draw drills 18 inches apart and about 2 inches deep. Sow the seeds thinly, cover them with fine soil, and rake the surface lightly with a wooden rake. If extra fine roots are desired make holes 3 feet deep with a crowbar and fill them with fine sifted, rich soil. Sow a few seeds at each station and cover them with 1 inch of the same compost. Later the best plant may be allowed to grow, removing the surplus ones. Keep a careful watch for slugs.

ASPARAGUS.—Take advantage of dry or frosty weather to wheel manure for the purpose of top-dressing Asparagus beds. The manure should be thoroughly decayed and broken as finely as possible with a fork. The surface of the bed should be disturbed lightly with a digging fork previous to applying the top-dressing. The alleys should then be dug and 2 inches of the lightest soil placed over the surface in order to retain the moisture in the manure. About the beginning of April a dressing of salt may be applied with advantage, and the surface lightly stirred with the point of a digging fork. If an early crop of Asparagus is desired, and sufficient crowns are available, there is no difficulty in having stems for use within three weeks from the time the roots are placed in the forcing pit. The forcing may be done on a bed of leaves and stable manure in any brick pit. The materials for the hotbed should be turned once or twice, trodden moderately firm, placed in position, and the surface covered with a thin layer of thoroughly decomposed manure under 1 inch of sifted leaf-mould. Lift the roots carefully and place them close together on the surface. The temperature of the bed must not rise above 75°. A covering of fine sifted leaf-mould should be placed over the crowns and watered in amongst the roots with water warmed to 70° to 75°. No further covering should be applied until growth commences, but when the young shoots are showing freely a further covering of sifted leaf-mould should

be applied to the depth of 3 inches to cause the shoots to grow rapidly. No fire-heat is necessary provided sufficient covering material is at hand in times of frost. One bed of leaves will retain sufficient heat to force several lots of roots provided it is lightly stirred when each batch of roots is introduced.

SHALLOTS AND GARLIC.—As soon as the soil is sufficiently dry plant Shallots in lines made 1 foot apart; choose light, rich ground. Make the sets firm in the ground and draw soil lightly over them. Garlic should also be planted now, and should be allowed a little more space between the rows than Shallots.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to St. James's Palace, Bart., Grafton Park, Reigate.

SEASONABLE WORK.—Work in the Orchid houses now consists chiefly in maintaining the proper temperatures, providing suitable atmospheric conditions, and cleansing the plants and houses. The plants should be kept as dormant as possible, care being taken that they do not start into growth prematurely, which might result in decay of the pseudo-bulbs and rhizomes. The temperature of the different houses should be as follows: Cool house, day, 52° to 55°, rising to 60° with sun-heat; night, 50°. Intermediate house, day, 60° to 65°, rising to 68°, with sun-heat; night, 57°. Cattleya and Mexican house, day, 60° to 65°, rising to 68°, with sun-heat; night, 58°. East Indian house, day, 68° to 70°, rising to 75°, with sun-heat; night, 65°. These temperatures should be governed more or less by outside conditions; for instance, when it is extremely cold, a rather lower temperature will cause less harm to the plants than excessive fire-heat. The maximum temperature should be recorded at midday. Warmth from the water-pipes may be economised with advantage by utilizing protective coverings over the roof exterior, removing the covering as early in the morning as the conditions will permit. Maintain a buoyant, moist atmosphere in each house, damping the stages and floors once or twice each day; but in this respect be guided by the amount of fire-heat required to maintain the requisite temperatures. In gardens in low lying districts much less damping will be needed during the winter months than in those in higher exposed positions. The ventilation of the houses should receive careful attention at all times. Fresh air should be admitted each day, a stagnant atmosphere being injurious to the plants. Open the bottom ventilators on the leeward side of the house, in order that the cold air may pass over the hot water-pipes before it reaches the plants. The cleaning of the houses should be finished by the end of the present month. The woodwork and glass should be washed thoroughly inside and out, first removing the plants from the stages to prevent them being splashed with dirty water. When this operation is over sponge the plants with a suitable nicotine insecticide, taking care to remove all scale-insects that may be present on the leaves and rhizomes. Watering: Plants at rest will only require sufficient water to prevent the pseudo-bulbs from shrivelling, but those that are growing freely will require frequent applications of moisture. The compost should be allowed to become dry before watering again, which should be done on bright mornings. Careful watering is one of the main secrets of success in the cultivation of Orchids.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. Arthur J. DAVY, Abbots Wood, Godalming, Surrey.

RASPBERRIES. The pruning and tying of Raspberry canes may now be attended to. The growths are regulated in a variety of ways, but the best system, perhaps, is that of training them to horizontal wires, as by this method I consider there is, yard for yard, a greater supply of fruit. Wires strained between iron standards set with good feet or supports will last a considerable number of years. If the old canes were removed last autumn, the remaining rods should be well ripened, and the strongest and best developed canes should be tied in at regular distances of

about 8 inches, cutting out the small, weak canes. Shorten the shoots that remain to 5 feet. Afterwards clear the ground of weeds and rubbish. If manure from an old hotbed can be spared, this may be spread over the surface to feed the roots. It is not too late to make new plantations of Raspberries. The ground should be well trenched, and if heavy in texture lightened by adding old mortar rubble. Bone meal also may be added, for the Raspberry, if properly cared for, fruits well for a number of years. Good varieties are Norwich Wonder one of the best flavoured sorts; Superlative, a heavy cropper; Bannforth's Seedling, a good variety which often succeeds where others fail; and Yellow Antwerp. Belle de Fontenay is the best autumn-fruiting variety.

GENERAL PLANTING.—It is not too late to plant all kinds of fruit-trees, provided the work is done quickly. Apples should be got in on prepared sites, and, if necessary, every tree should be firmly supported by a stout stake, which should be made very firm in the soil. Fasten with a secure tie of tarred string, or, in the case of standards, use Beckett's patent band. Mulch with littery manure to prevent damage to the roots by frost. Pears, Peaches and all wall trees should be planted without further delay. In clay or very heavy soils it may be necessary to employ some dry lime rubble or fine soil. Fasten the trees to the walls lightly and leave them for a week or two for the soil to settle before finally tying them in position. Litter or light manure spread on the soil will be an advantage in keeping the roots warm. Label each tree in a prominent part. Labels of black letter on white enamel are efficient, durable, and inexpensive.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcote, Eastwell Park, Kent.

FORCING FLOWERING SHRUBS. It is not advisable to bring shrubs for forcing direct from the open into a warm house, but to start them in moderate warmth, and to raise the temperature gradually as growth develops. A good plan is to place the plants in a fruit house that has been closed for forcing, the small amount of extra warmth such houses provide being quite suitable for flowering shrubs. The shrubs may afterwards be moved into a forcing pit, and remain there until the flowers are well developed, when they should be accustomed gradually to cooler and drier conditions. Prevent sudden changes in the temperature and direct draughts of cold air. Spray the plants before the blooms develop several times daily, according to the weather, to promote a damp atmosphere.

AZALEA. Of Azalea sinensis hybrids there are many that are fine decorative subjects for indoors; Anthony Koster, W. E. Gladstone, Glory of Bockloop, Mme. A. Koster, G. Cuthbert and Florida are six sterling varieties of this class, and can be recommended for pot work. Unnamed seedlings may usually be purchased very cheaply, and these seedlings are valuable where large quantities are required for grouping. The variety J. C. van Tol has beautiful flowers of deep chartreuse colour, and is one of the best of the A. indica section. Alphonse Lavallée, Comte de Quincey and Brilliant are other excellent varieties, and with a few of the double-flowered A. indica and the Ghent Azaleas of which Fanny, Unique and Rose Marie are good examples, will furnish a good display of flowers until Azaleas bloom outside. A. indica is grown in large numbers for forcing, and the plants are cheap. There is a wide range of colours in this class, so that it is easy to select the varieties according to the shades desired. The very small plants are suitable for placing in small vases in dwelling rooms.

LILAC.—The Lilac is one of the best flowering shrubs for forcing. Charles X., Mme. Lemoine, Mme. Lagrange, President Grévy, Michael Bacher, and Souvenir de Louis Spohr offer a varied selection of good varieties for forcing.

RHODODENDRONS.—The showy varieties of Rhododendrons make a pleasing change in the conservatory, but these plants should never be subjected to hard forcing.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C. Editors and Publisher.—Our correspondents would oblige by delaying in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to give any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JANUARY 23.—

Gardeners' Royal Ben. Inst. Annual meet. and Election of Pensioners at Simpson's Restaurant, Strand.

SATURDAY, JANUARY 27.—

Nat. Auricula Soc. (Northern Sect.) Annual meeting.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty days at Greenwich, 40.2°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, January 11 (10.0 a.m.): Bar, 29.5°; temp. 38.5°. Weather—Dull.

SALES FOR THE ENSUING WEEK.

WEDNESDAY.—
Bulbs, Fruit Trees, Roses, Herbaceous Plants, &c., at 12 o'clock. At 2 o'clock, Narcissus, Tulips, Gladioli. At 3 o'clock, 250 cases of Lily of the Valley and Japanese Lily, received direct. At 6 and 8 o'clock, Cheapside, E.C., by Protheroe and Morris.

THURSDAY.—
Chimney Roses at 1 o'clock, at Protheroe and Morris's Rooms.

FRIDAY.—
Orchids, at 1 o'clock, at 67 and 68 Cheapside, E.C., by Protheroe and Morris.

Potato Prices.

We drew attention last week to the decision of the authorities to fix the price for this year's crop of Potatoes at 115-130 shillings a ton, and pointed out that this decision must have for its effect the discouraging of Potato growing. The experience of small growers may be added to that of large growers—as recorded on another page by a Potato expert and in the correspondence columns of the daily Press, that at this maximum price the risk of loss to the grower is a very real one. Without wishing to be unduly pessimistic, we must, we fear, be prepared for a light crop per acre in 1917, and this chiefly for two reasons—the lack of potash manures and the large amount of home-grown seed which will be planted. Yet it cannot be doubted that everything that can be done should be done to put land under this crop. Notwithstanding every effort, there may be a shortage of vegetable food during the coming summer. In these circumstances, and so long as the men who produce the crops are remunerated fairly for their work, a glut, should it unexpectedly occur, would be welcomed. With proper forethought, it would be possible, if the

Board of Agriculture really anticipates a glut, to provide for the State purchase and drying of the surplus for winter use. That provision—as a precautionary measure—ought to be made in any case. But for the reasons given already we fear that no such happy state of affairs as a surplus of Potatoes is likely to arrive. Therefore every effort to increase production should be made. We believe that the Milner report indicated a proper way whereby growers could be assured of a fair remuneration and profiteering be checked; a minimum price and a "call" price would secure these ends.

Into the question of the undue lowness of the maximum which has been fixed we need not go. It is manifest that the price will not encourage any experienced person to grow Potatoes for the market.

It is all very well for the authorities to fix the price of best seed at £12 a ton. This is too late in the day, and we are not unreasonably sceptical of what this "best" will be. Provident growers have been buying their seed already, and have had to pay more than this price. The "best" can only be what is left over, and it looks only too probable that not a little of the seed will be "ware," and that therefore it will not go so far, or will have to be cut, in which case the labour will be increased at once.

The time chosen for official intervention is as unfortunate as the manner thereof. It is within our knowledge that some months ago, when a shortage of Potatoes was already manifest, representations were made to the Board of Agriculture suggesting the advisability of their obtaining control of the crop at lifting time. These representations were ignored. Nothing was done until contracts had been made, and much of the "ware" and seed disposed of at high figures. Then came the intervention "too late," as usual—and its only effect has been to disorganise the market and discourage planting. To offer to sell the best seed at £12 a ton when the best has been sold already at far higher prices is not only to impose serious loss on those traders who hold stocks which they themselves have purchased at a higher price, but also to undertake what seems impossible of fulfilment.

We urge, therefore, that the orders be withdrawn, that a fair minimum price, and, if necessary, a "call" price be fixed for next year's crop, that traders be recompensed for bona-fide losses which the selling price of £12 a ton for seed imposes upon them, and that plant be provided in the Potato-growing districts for large-scale drying of Potatoes in order that the wastage of this year's crop may be reduced to a minimum.

CHELSEA AND HOLLAND HOUSE SHOWS.

We are informed by the secretary of the Royal Horticultural Society that the Council has had great anxiety in coming to a decision whether to hold these two large shows in 1917, and had at first decided to continue them, but, added to the trouble arising from the shortage of labour, the difficulties of transport, and the Government's desire to reduce travelling to the utmost possible

extent, it now finds itself confronted with a further difficulty that at the last moment the contractor has reported that he cannot guarantee to get up the tents. For all these reasons the Council has decided to abandon these shows. In arriving at this decision, after the most careful consideration of all the points both for and against it, the Council hopes it will have the support and approval of every Fellow of the Society. In the place of these two shows ordinary fortnightly meetings will be held at the London Scottish Drill Hall, Buckingham Gate, on the usual fortnightly dates, namely, May 22 and July 5.

ABANDONMENT OF SPRING ROSE SHOW.

We learn that the Spring Rose Show of the National Rose Society has been abandoned for the present year, by the decision of the council at their meeting held on the 16th inst., immediately after the annual general meeting.

NATIONAL CHRYSANTHEMUM SOCIETY.

The annual meeting of the National Chrysanthemum Society will be held at Carr's Restaurant, Strand, on Monday, February 5, at 6 p.m.

THE CROPPING OF WASTE LAND SEVENTY

YEARS AGO.—Having entered to the farm of Parkton, containing 70 acres of arable land, in 1838, after putting it into good order, my attention was directed to the improvement of a piece of waste land, which stretched in a continuous line along the north-east side of the farm, with the exception of a few patches to the south. I have altogether improved 50 acres, of which 30 acres have been brought under the plough during the last three years. The ground was formerly under Fir wood, which was cut and sold about twelve years since, with the exception of a few acres, which are still standing. The surface was generally covered with short stunted Heath, the pasturage on which was probably not worth more than 2s. per acre. The soil was a clayey gravel, in some places inclining to peat, on a subsoil of wet, clayey gravel. The ground was trenched 12 inches deep, with the exception of three acres, which were taken in with the plough, and about 25 acres were partially furrow-drained, at 18 and 24 feet apart, according to the retentive nature of the subsoil. Large open drains were made to subdivide the ground into fields. The expense of these improvements was as follows:—

Trenching 28 acres at £6 per acre	£168 0 0
Ploughing 3 acres and taking out roots	6 0 0
Clearing the ground of roots, stones, and levelling	62 0 0
3,355 yards of large covered drains at 2d. per yard	27 18 10
2,975 yards of large open drains at 1d. per yard	18 11 10½
20,593 yards of furrow drains at 1d. per yard	84 19 10
Total	£367 10 6½

Making an average cost of £11 17s. 1d. per acre. The first crop was taken in 1843 from about 10 acres, which were well limed, and manured with farmyard dung and sown with Barley, which yielded a pretty fair crop of about four quarters per acre. In the following year, 1844, this ground was pastured. In 1845 it was broken up for Oats, which yielded a very fair crop, probably five quarters per acre. The remaining 20 acres were prepared for Oats in 1844 by manuring and liming, and the crop was a fair one, at least five quarters per acre. In 1845, this portion was under Turnips and Potatoes, the Potatoes being a good crop, but the Turnips were below an average.—*Gardeners' Chronicle*, January 23, 1847.

THE VARIETIES OF VANILLA.—Of the four distinct Vanillas mentioned by Scheede as occurring in Mexico, Messrs. CONSTANTIN and BOIS,

— "Les Variétés de Vanille," *Comptes Rendus de l'Acad. d. Sci., Paris*, 183, p. 196.

in the course of their recent investigations recognise two—*Vanilla sativa* and *V. sylvestris*—as being the most important commercially. They represent two species. The former with oblong leaves and an ungrooved capsule is the best Vanilla. The latter has oblong-lanceolate leaves and grooved capsules. Messrs. CONSTANTIN and BOIS believe that of the Vanillas in Tahiti three forms belong to the *sylvestris* type.

GERMANY'S LACK OF POTATOS.—Touching Germany's Potato supply, the *Figaro* (Paris) states: "In certain localities each coupon of the Potatos card only gives the right to the half of the quantity indicated thereon. In Berlin, in spite of the seven coupons of the Potatos card, the holders can only obtain six pounds per week." On December 21 the Municipal Council of Mühlhausen dealt with the question of provisioning in Potatos. The Mayor has had the following declaration published in the *Mühlhäuser Tagblatt*:—"There has been assigned to the town the duty of affording provisioning, besides

can be applied easily by means of a slightly worn paint brush, and should be well worked into the crevices of the bark. The work should be done thoroughly in winter, and the trees closely watched the following spring and early summer for any pests that have escaped destruction.

Pigs.—All pig-keepers, notwithstanding the present high price of feeding stuffs, are urged by the Board of Agriculture to make every possible effort to maintain the supply of pigs. Sows with access to shelter will pick up a considerable part of the food they require out-of-doors. Where grass is scarce a few Swedes or Mangolds, together with a pound or two of Beans or finely-ground Palm kernel cake, will serve to carry most sows through till fattening time. For fattening pigs 8 lb. of Swedes, boiled, are equivalent to 1 lb. of cereal meal or offals. Small or bluish-tinted Potatos are twice as valuable as Swedes for feeding purposes, but these should be reserved for the later stages of

still, as was the case last month, nearly 15 per cent. less than in the corresponding date last year. The early sown Wheat is quite satisfactory, but that sown later is germinating very slowly, and, where it is above ground, it is often poor. Seeds are practically everywhere a good plant, healthy and vigorous, although the sharp weather at the end of the month checked their growth somewhat. Turnips and Swedes are generally keeping well; they are satisfactory crops. In many districts more of these roots are being left to be fed off in the ground than usual, and fewer have been lifted.

FRENCH NEEDS AFTER THE WAR.—A well known American manufacturer of agricultural implements, as quoted by *Gardening* (Chicago, December 15, 1916), has found on inquiry of the French Minister of Agriculture that among the equipments which will be required after the end of the war are 120,000 ploughs, 17,000 traction engines, 10,000 threshers, and so on. The American implement maker, in looking forward

FIG. 11. GONNERBYA CAMBODIA BRINDLE VARIETY (See Awards, p. 10). (British Committee, p. 70.)

the *arrondissement* of Mühlhausen itself, for those *arrondissements* of Altkirch and Gelnau or Worms and Darmstadt had also to send supplements. However, from the outset the system has completely failed, through lack of Potatos. The administration of the town put itself in relations with the Prefect. The Mayor was of opinion that, since the peasants were keeping back their Potatos, it must come to military requisitions. It did come to that, in point of fact, but without sufficient result. We are lacking 560 vanloads to cover our needs up to April 15, 1917. Worms and Darmstadt, which owed us 1,700 vanloads, have not yet sent a pound to replace the Potatos we had to have large quantities of Kohl-Rabis. They are being delivered to us no longer. Add to that the fact that 600 vanloads of Potatos coming back to the Communal Union of Haute-Alsace have been taken for the provisioning of the Army."

AMERICAN BLIGHT.—Paraffin oil is a most effectual specific for destroying woolly aphid. It

fattening. To supplement roots, the cheapest and most suitable foods at the present time are finely-ground Palm kernel cake, Bean meal, Maize gluten food and dried grains. Later on Clover, Sainfoin and Lucerne will be available in place of roots, and smallholders should consider whether they can find space to add these to their crops. Edible domestic refuse should be reserved as far as possible for pig feeding.

THE CONDITION OF THE FARM CROPS. The Board of Agriculture and Fisheries monthly agricultural report states that the weather during December greatly hindered work on the land. In some districts the first fortnight was fine enough to allow of some progress being made, but in most parts the weather was too stormy for much to be done, and later there were frosts. Only a comparatively small area was consequently sown with Wheat, and it is estimated that by the end of the year little over two-thirds of the area intended for this crop had been got in; while the total area sown is

to provide the tools for French and Belgian harvests, hopes to reap a golden harvest of his own.

VEGETABLE-GROWING IN SCOTLAND.—The governors of George Heriot's Trust, Edinburgh, have agreed to place a considerable area of their vacant lands at the disposal of allotment holders. The Dundee Public Health Committee has decided to cultivate a considerable area of land at the public hospitals. Arbroath Town Council will grow vegetables and other crops on land belonging to the burgh and also utilise part of the Carnegie Park for the purpose. Ayr Town Council has appointed a committee to arrange for the cultivation of waste and other land with vegetables. Musselburgh Town Council is providing a number of allotments, for which numerous applications have been made. The Kilwinning Town Council has agreed to invite offers of land for allotments and to utilise some of the Public Park. Part of the lands belonging to the Town Council of Lanark is to be applied to allotments for the

cultivation of vegetables. As a result of the movement by the Dumfries and District Horticultural Society, the Dumfries Town Council re-mitted it to the Public Health Committee to consider the allotment question, and that body is now advertising for land and for intending allotment-holders. Hawick Town Council has resolved to let a field for allotments.

CONGRESSIONAL DISTRIBUTION OF SEEDS.—

The annual free gifts of flower and vegetable seeds which the Government of the United States of America makes, through the Representatives, is receiving a deal of opposition and criticism from various members of the House. It seems that there are available for distribution by each member to his constituents 20,000 packets of garden seeds, and that practically all avail themselves of the opportunity to "give a cheap sop for past loyalty" to the voters. The total cost to the country for purchasing and distributing these seeds during four consecutive years ending in the season 1912-13 is reported to have been 1,110,953 dollars, and the cost of postage, which is not charged, was a further sum of 467,759 dollars. In all, during the period mentioned, 43,563,801 packages were sent through the post. The criticism and opposition to the distribution, which has the sanction of custom, is twofold—the policy and the quality of the seeds. In a recent speech in the House of Representatives Mr. P. P. CAMPBELL, of KANSAS, asked "whether or not these seeds were purchased abroad, because it was hoped that the department (of Agriculture) would get a variety of seed that would be useful in introducing new plants into the United States, or whether it was done because a lot of miscellaneous and badly mixed seeds could be purchased cheaper abroad than in the United States. I know something of the character of the seeds sent out," he continued, "and they were a badly mixed lot of poor seeds. Cucumber seed and Cautoulepe seed were mixed indiscriminately; Water-Melon seed and Pumpkin seed were mixed in the same package; and six separate kinds of Lettuce were mixed in one small package, all marked some sort of special Lettuce, and yet there were six kinds in that little package—all poor."

THE WORLD'S CROPS.—If any man needs evidence of the importance of cultivating as much food as possible, he will find it in the statistics* of the world's crops. The Wheat crop of the United States is below the average and export will be reduced. The Argentine has produced little more than half its average crop. The yield from the Northern Hemisphere in neutral or allied countries, and in the Old and New Worlds, is about three-quarters of last year's crop, and somewhat under the average. Nor is the shortage of Wheat made good by increased supplies of other cereals. The Rye of the Northern Hemisphere is nearly 5 per cent. less than in 1915, Barley nearly 10 per cent. less. The world's Oat crop is about 14 per cent. less than last year, and Maize, so far as is yet known, has given a poor return. When it is remembered that armies are inevitable, and in spite of every precaution, extravagant food consumers, it will be evident that many people in the world will go hungry during this year, and that it is the duty of every man who has the use of ground to grow all the vegetable food he possibly can.

VEGETABLES.

INTERCROPPING.

AMONG the many schemes which are being brought forward to increase the supply of food intercrops is probably one of the best, although I do not agree with Mr. Bagg (see p. 307) in planting Lettuce between Onions or Turnips and Spinach between Strawberries. As Mr. Archer (p. 9) states, the best system can only be devised by the man on the spot, as every observant gardener knows no two gardens can be worked to the best advantage on the same lines; knowledge and experience have to be adapted to soil, situation, and requirements. On these lines I offer the following suggestions for intercrops:—

(1) New Strawberry plantations may be successfully interplanted with Tripoli, or Onion sets and Shallots, placing the plants alternately between plants and lines. The preparation of the land for Strawberries renders it suitable for Onions.

(2) When Dwarf French Beans are sown, Radishes may be sown amongst the Beans, and in alternate lines; the Radishes will have two values—as a covering for the young Bean plant from late frosts and supplying a crop of food.

(3) Between Runner Beans and Peas possibly Turnips, or Turnip-rooted Beet, will give the best results. If Turnips are used give the space a good dressing of wood-ashes.

(4) Among bush fruits, and possibly Roses which are grown for cut flowers, a quick-growing Cabbage, such as First and Best, or Early London Cauliflower, should give a good return for labour.

(5) In many gardens there is a danger of Beet seedlings being damaged by a late frost. A few Radish seed sown among the Beet will often provide sufficient covering to protect the young Beet, and yield a little extra food.

(6) As labour is short and expensive it may be found a good policy in planting Potatoes to plant an early and a late variety in alternate lines, 2 feet or less between the lines; thus, a line of King Edward, then a line of Sharpe's Express. These may be planted at the end of March or beginning of April. Should the young plants appear before all danger of frost is past cover them with soil. The advantage of this method will be that the Sharpe's Express may be lifted in time to intercrop with Cauliflower, Kales, Brussels Sprouts and Broccoli, leaving the King Edward to mature for winter use. It is hardly necessary to state that late varieties of Potatoes may be planted until the first week in June, and that early varieties may be planted until the first or second week in July, with good hopes of a profitable return. This late planting will be found useful for filling spaces which have been occupied by other crops, and, on account of labour, the point to remember is, to estimate the quantity of seed which may be wanted, and, if available, to store the tubers in a cool place. J. E.

NOTES ON TRENCHING.

THE advantages gained by trenching heavy soil which has a hard, pan-like subsoil are many. First, the subsoil is made warmer owing to the admission of air, and naturally this is a great aid to plant growth, especially during the early spring months. Secondly, moisture is conserved in the soil longer during dry weather in the summer. Thirdly, deep trenching provides a free rooting medium, also it provides a quick percolation for water, thus avoiding stagnation about the roots, which is extremely important in the case of fruit trees. Even meadows and lawn turf dip beneficial effects where trenching has been done.

But there are soils that would receive no benefit from trenching—soil of a sandy character,

for instance, or that overlies closely a chalk subsoil. Soils that benefit most by trenching are those which have a hard pan of callus-like subsoil, not actually clay, but a near approach to it, and although it may be, as is often the case, freely mixed with flint stones, even these fail to give sufficient porosity for a rapid percolation of water from heavy rains. Even in gardens that have long been in cultivation and were properly trenched at the start the soil is rendered all the more suitable to plant life by repeated trenchings every fourth year.

There are two methods of trenching, bastard and deep trenching. The former is all too commonly practised, because it is easier than the more thorough method of moving the soil to a greater depth. Bastard trenching as I know it is thus: The top spit and the loose soil at the bottom of the first trench is taken out; the lower spit is deeply dug over instead of being taken out entirely.

The trenching I advocate, especially for new plots, is managed as follows: Mark out a trench 2 feet wide, wheel the whole of this soil to a depth of 2 feet to the opposite end of the plot. Break up the bottom of the trench to 1 foot deep. This extra moving of the subsoil will provide a more rapid water percolation. Another 2-foot trench is marked off and the top spit and loose soil is also wheeled to the opposite end of the plot, to be used in filling up the last trench. The second spit is thrown into the first trench and the top spit of the third trench completes the first. This method allows of every spit of soil being left in its original position. The surface soil naturally provides a better tilth than that which has never been exposed to the air or had the direct benefits of manuring.

If long, strawy manure or freshly gathered leaves is available, add them liberally to each trench as the trenching proceeds, reserving the shorter manure for the top spit. Roadside refuse, burnt earth, wood ashes, old potting soil and decayed vegetable refuse are useful additions to newly-trenched soil, improving the porosity. In February, if the weather is dry, a free sprinkling of quicklime spread over the surface will further improve the tilth, forking it lightly in.

I have been frequently told that the bottom spit should be brought to the surface, and the top spit placed in the bottom of the trench. If I could obtain sufficient good compost to cover the surface 1 foot thick in which to grow the first season's crop I should advocate that method of trenching, but knowing how impossible it is for the amateur residing on the outskirts of a town to obtain any of the ingredients mentioned above, I cannot recommend the practice. E. Molyneux.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE LEAF OF PEACHES AND NECTARINES (see p. 6).—Perhaps few of us really know what a kidney- or round-shaped gland on a Peach leaf is, and as for the different varieties of serrated edges and plain edges, these are matters that do not attract the eye of the general grower. To the initiated such details are of much importance, for the above types, together with the large or small size of the flowers, give to us at once the true and authentic names of the varieties. Of recent years I have not had the opportunity of studying the subject so much as I could have wished, but the reading of the interesting article on the subject revived a latent interest. A Peach grower has always noticed that glandless varieties were more prone to attacks of mildew, but with reference to Peach blister my own observations were that all types suffered. You suggest that Peaches and Nectarines offer a fascinating problem to the student of genetics. So I think they should be interesting to the propagator and grower of young stock, for I believe by double

working (budding) or budding on the stock that will impart vigour to the tree, blister and mildew may be overcome. I know full well many Peaches and Nectarines, through improper cultivation, will suffer from blister and mildew, but, nevertheless, those varieties which are constitutionally prone to it may be strengthened to resist the disease. The Mussel, Brussels, and Brompton stocks are used for budding Peaches and Nectarines in this country, and it is only in first-class nursery establishments that a defined rule as to the different varieties best adapted and suited to the different stocks is followed. Herein often lies the secret of productivity. *W. H. C., Hampton.*

GARDENING AT RUHLEBEN CAMP.—I append herewith a letter received from the Prisoners' Camp at Ruhleben, acknowledging the bulbs and seeds sent to the Royal Horticultural Society by its Fellows and friends for despatch to the Ruhleben Horticultural Society. The president and council wish to take this opportunity of thanking all those who so kindly identified themselves with this effort; they will be pleased to know that their parcels are arriving safely.—Yours faithfully,

W. WILKS, Secretary.

"Royal Horticultural Society,
London.

"Dear Sirs,

"I am in receipt of your letter of 12th October announcing that the Ruhleben Horticultural Society is affiliated to the Royal Horticultural Society, London, which was laid before my Committee.

"I am instructed to tender to you my heartfelt thanks for this kind assistance to the society's aims and also for the six cases and one parcel, containing bulbs and seeds, which have been duly received. These have, I am already planted, and a very successful start is now assured. They also beg to acknowledge, with many thanks, the receipt of the six pamphlets on gardening subjects and to inform you that a syllabus of lectures has already been commenced with great success. A copy of this syllabus, and also of the papers given, shall be forwarded in due course.

"On Friday last I received your letter of November 20, advising the despatch of eleven further cases of bulbs, etc., and for this I wish to express to you my warmest thanks and also to those friends who so kindly sent us gifts of bulbs through your medium. As soon as the eleven cases arrive I shall inform you thereof.

"Enclosed please find a few of our membership cards which I hope will be of interest to you.

"Again with many thanks and the best wishes to all for Christmas and the coming New Year.—I remain, Yours faithfully,

(Signed) T. HOWAT,

Hon. Secretary,

Ruhleben Horticultural Society.

Bar 5, Box 15.

December 20, 1916."

OLD SEED AND PLANT CATALOGUES (see p. 9). In reading through the several numbers of seed and nursery firms in the interesting article that appeared in recent issues of the *Gardeners' Chronicle*, one prominent nursery seems omitted that in its day was, I believe, considered the first and foremost of its class. I have some recollection of it since 1866, and have on occasion interested myself in the wonderful and varied collections found there. I refer to Messrs. Rollison's, of Totting, Surrey. Although a youngster at the time, I remember the advent of Rollison's Telegraph Cucumber, the parent of so many varieties since, and its sale at that time at 1s. per seed. Whether the raiser—a small private gardener close by—was remunerated to any great extent, I don't know, but it certainly was a boon to the distributors. Messrs. Rollison's catalogue was of a bulky nature, and contained a wide and diversified collection of plants of all genera. Such a list is not, to my knowledge, published by any nurseryman at the present day. It is an interesting, valuable and thoroughly practical work, and a book of reference. My own copy was

handed me by its former owner, who had it interleaved with plain paper, for the purpose of recording notes as to the best means of propagation and cultivation. On many occasions I have found the notes of considerable assistance and importance. Where the site of the nursery is now I failed to discover the last time I was in that neighbourhood. *W. H. C., Hampton.*

—The mention by *C. H. P.* (p. 9) of Maddock's nursery at Walsworth brings to mind a conversation I had recently with

the 12th inst., there are no signs of the Winter Avonite pushing through the soil, yet we usually have some flowers open before this date, whilst in 1912-13 the blossoms were open on November 24, being the earliest date I have recorded. Avonite blanda, *St. reticulata* and *Crocus Imperati* are also backward. *Daphne Mezereum* and *Jasminum nudiflorum* are the only plants that have flowers open, with the exception of *Stembergia lutea*, which has lately developed a number of its bright yellow flowers, that usually

RUHLEBEN HORTICULTURAL SOCIETY
MEMBERSHIP-CARD

SEASON 1916-17.

PRESIDENT - Mr L. P. Warner
VICE PRESIDENT - Mr M. Pritchard
HON VICE-PRESIDENTS - Messrs. C. L. Bretneyer, Walter Butterworth J. P., W. S. Cohn, A. E. Dodd, G. F. Fisher, F. W. Hession, F. H. Lazarus, B. G. Levin, D. J. E. J. Legg, W. F. McKenzie, A. H. Mitchell, O'Hara Murray, F. Silbermann, E. Silbermann
CHAIRMAN - Mr L. P. Warner, Bar 8, Room 2
VICE-CHAIRMAN - Mr L. P. Roberts, Bar 5, Loft B
HON SECRETARY - Mr Thomas Howat, Bar 5, Box 13
ASSISTANT SECRETARIES - Messrs W. M. Harris and W. E. Mell
HON TREASURER - Mr T. Howat
COMMITTEE - Messrs J. Blackburn, W. Cayley, H. Cooper (10), W. R. Cooper (5), A. Hill, J. Lazarus, M. Pease, P. Soans, P. J. W. Simson, G. A. Wylie

MEMBER'S NAME - Mr

Bar. Box. Loft.

RULES AND STANDING ORDERS OF THE
"RUHLEBEN HORTICULTURAL SOCIETY"

Title of the Society. That the Title of the Society be the "Ruhleben Horticultural Society".

Aims of the Society. That the aims of the Society be to further the knowledge of Horticulture and give members an opportunity of studying this subject by assisting in the laying out and attending to the flower beds in the Camp.

Membership. That the Society be open to all interested in Horticulture and that the Membership Subscription be 1/1 per annum payable on entering. Application for Membership to be made to the Hon Sec. of the Society.

Privileges of Membership. That Members be entitled to attend all lectures and papers arranged for by the Society and perusal of any literary matter should such be obtainable.

Officers and their Election. That the Officers of the Society consist of a President, Vice-President, Chairman, Vice-Chairman, Secretary and Treasurer, who are to be elected at a General Meeting of Members.

The Committee. That the business of the Society be conducted by a Committee of not less than eight and not more than twelve members including the Vice-Chairman; these gentlemen to be elected at a General Meeting of Members. The period of office to terminate at the expiration of one year from date of appointment. The Hon Sec. to have full power to vote and together with five members of the Committee shall form a quorum.

The Chairman of the Meeting shall have power to vote and in addition have a casting vote. Nomination of Members to fill any vacancies which may occur during the year to be made at a General Meeting of Members. The Vice President shall be an ex-officio member of the Committee.
General Meeting. A General Meeting shall be held fortnightly when, if necessary, a short report of the work will be made to the members, followed by a paper on some Horticultural subject. All notices of Meetings are to be conveyed to members by means of a public notice board, which notice shall be considered sufficient.

Finance. That the Committee be empowered to purchase bulbs, seeds, implements or any other accessories out of the Society's funds and to carry out all financial business connected with the Society. That the Accounts of the Society be audited by an Auditor, not a member of the Committee, who shall be elected at a General Meeting of the Society.

Alteration of Rules. Alterations, amendments or additions to the Rules shall be made at any General Meeting, should such alterations, amendments, or additions be found necessary.

Appendix.
The Committee meet every Thursday afternoon from 3 to 5 p.m. in Mr Lazarus' Summer House behind Bar 6 & 7 where members may apply for information. Members wishing to assist in gardening are asked to hand their names to Mr Warner, Bar 8, Room 2. Requests for work parties will be posted on notice board, if possible, the day before going out.

FIG. 12. MEMBERSHIP CARD AND RULES OF THE RUHLEBEN HORTICULTURAL SOCIETY.

a relative living in Peckham Grove, who told me that he remembered a large nursery existing upon what are now back gardens to the Grove. There seems some proof of this, for there are still trees and shrubs growing such as one would hardly expect to find in a back garden. This is now the Camberwell district, but it is possible that at one time it was part of Walsworth, which it adjoins. *J. J. Edgar, Geygong Hall Gardens, Newport.*

SPRING FLOWERS.—Early flowers in the open are much later than usual this season. To-day,

appear in November. I am unable to account for this general lateness. December has been cold; in fact, the coldest December during the 23 years I have been here. The mean temperature was only 33.70° and this is 5.37° below the average. But November must influence the early growth of this Avonite, as it once flowered on November 24, and this season November was 0.78° above the average mean temperature; while October was 1.78° above. November also had 12 hours sunshine above the average, but I do not consider sunshine in November is the determining factor in

the case, because in 1912, when the *Aconite* flowered in November, the sunshine here was 553 hours below the average; in that year October was 28.9 hours above the average. Is the *Aconite* late everywhere this season? W. H. Divers, *Bolton Castle Gardens, Grantham.*

TREATMENT OF STRAWBERRY BEDS (see p. 9).—The drainings from the stable or farmyard, when used with care, cannot be surpassed as fertilisers for the Strawberry. Care must, however, be taken to dilute the manure, for it is highly charged with ammonia. Ordinary farmyard drainings from cowsheds, even when used in conjunction with that from stables, is less drastic in its action than from horses, and can therefore be used with greater safety. We depend upon annual plantations for furnishing dessert fruit, and in no case do we retain the plants after their second year. In forming a plantation we secure the earliest runners, treat them in the usual way, and plant out when they are rooted sufficiently, invariably upon ground that has carried early Peas. As soon as the plants root freely in the soil they receive a thorough application of liquid manure, and this treatment is repeated on occasions until growth ceases. But as soon as leaf growth again commences, and until the fruit begins to change colour, the roots are again fed with the liquid stimulant. *Thos. Coulter, The Hendri Gardens, Monmouth.*

A RARE POMOLOGICAL WORK.—In comparison with neighbouring countries Holland has produced but few books dealing with fruits. If we except the outburst of works on Oranges and other Citrus fruits in the seventeenth century, nothing of importance was published until the well-known *Pomologia* of Knapp in 1753. In more modern days there is but the *Nederlandsche Boomprij* of Oetlander and other authors published in 1863. The gap between these last two was filled by the *Pomologia Batava* of Van Noort, and it is to this work that I wish to refer. For many years I have accepted the existence of such a work on report only, repeated search in libraries in France, Holland, Germany, Belgium, and at home failed to discover it, and I began to fear it was one of those flying Dutchmen who are more talked about than seen. However, a copy has turned up at a sale in Holland, and through the kindness of a friend, combined with a happy intervention of fate, which prevented it from being sent on the mail boat captured by the Germans, it has come into my hands. The full title of the work translated is "*Pomologia Batava*, with plates and descriptions of several of Apples and Pears which are grown in the Dutch Country. All coloured and described from Nature by Mr. Mathieu van Noort. Leiden, 1550." The size is quarto, and forty-four plates of Apples and forty of Pears are given (twenty of each, as I stated in my *Guide to the Literature of Pomology*, on borrowed information). It was published, I believe, in parts, from 1530 to 1540. The plates are lithographed and probably considerably retouched by hand, and are very fair specimens of such work, delicate and restrained in tone, but not so fine an example of this process as may be found, for instance, in DeCaen's *Jardin Fruiter*. The descriptions are short and not particularly detailed. The preface is autographed, and the general appearance leads one to suppose that a very limited edition was produced. Batavia, it may be said, was an old name for Holland. As I believe no description of this work exists, I venture to place one on record for the guidance of collectors. *E. A. Bagnard.*

EARLY MELONS.—To obtain early Melons the plants should be raised from seeds sown now. In a few weeks there will be more sunlight, and growth will be more free. For the earliest crop I prefer Ringleader, a green-fleshed variety of first-class flavour, vigorous constitution, and a free setter. If only a small number of fruits is required I advise the growing of the plants in pots, which results in a saving of soil and labour. I have succeeded well with early Melons by raising them in small pots on shelves close to the roof glass. In this way a stocky growth is secured, and this is all-important. *H.*

SOCIETIES.

ROYAL HORTICULTURAL.

JANUARY 16.—The first of the R.H.S. fortnightly meetings for 1917 was held on Tuesday last in the Drill Hall of the London Scottish, Buckingham Gate, Westminster. Thus, after a lapse of thirteen years, the Society has reverted, for the present, to the place of its former activities, and although not comparable with its own spacious and well-lighted building, the Drill Hall will no doubt serve the purpose of the fortnightly meetings until the return of normal conditions.

The opening meeting of the year was not very successful, but this fact was due to inclement weather. A fall of snow added to the difficulties of transport, and many who intended exhibiting were compelled to withdraw at the last moment.

The principal exhibit was a collection of Apples, for which the Fruit and Vegetable Committee awarded a Silver-gilt Knightian Medal.

Carnations and Pelargoniums formed the only exhibits in the floral section, but two novelties received Awards of Merit from the Floral Committee.

There were good exhibits of Orchids, and the Orchid Committee recommended one First-class Certificate and three Awards of Merit to novelties.

Floral Committee.

Present: Messrs. H. B. May (chairman), W. J. Bean, G. Reuthe, John Heal, R. Hooper Pearson, J. F. McLeod, W. Howe, J. Jennings, A. Turner, John Dickson, C. Dixon, H. J. Jones, H. Cowley, C. E. Pearson, W. P. Thouson, E. H. Jenkins and R. C. Notcutt.

AWARDS OF MERIT.

Corylus Avellana contorta. A remarkable form of the common Hazel, in which all the shoots are contorted, frequently in a spiral manner. Mr. Bowles, in *My Garden in Spring*, states that the abnormality was first found in a hedge by Lord Duce, near Tortworth, Masters, in *Vegetable Pathology*, p. 316, states that "irregular twisting or bending of the shoots is by no means of uncommon occurrence, the inducing causes being often some restriction to growth in certain directions, or the undue or disproportionate growth in one direction as contrasted with that in another." The abnormality is found in other shrubs, including *Cataegus* and *Robinia*. Shown by the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Ed. B. Beckett).

Cyclamen Crimson St. George. The special merit of this fine decorative plant is its handsome variegated foliage. The leaves have a silver-grey border about 1 inch in width, sharply defined from a dark, velvety-green centre, whilst the veins, of a tone midway between the pale and dark shades, extend towards the margin, giving a mosaic appearance. The flowers are a rich shade of crimson, large, well-formed, and equal generally to the best type of bloom in this popular winter flower. Shown by Sr. GEORGE'S NURSERY COMPANY, Harlington, Middlesex.

GROUPS.

Two Bronze Flora Medals constituted the only awards made to collections. They were awarded in each case for collections of Perpetual-flowering Carnations, shown by Messrs. STURAN LOW AND Co., Enfield, and Messrs. ALLWOOD BROS., Wivelsfield, respectively. Messrs. Low's group included a few other indoor plants—*Begonias* and *Colens thyrsoideus*.

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Edwin Beckett) showed a novelty in a golden sport from the common Holly, named Golden Prince. The variegation is along the margins of the deep grassy-green leaves.

Messrs. H. CANNELL AND SONS, Swanley, exhibited bunches of zonal-leaved Pelargoniums, the best varieties being *The Scarlet*, scarlet; *Mrs. Jackson*, rosy pink; *Countess of Radnor*, Mrs. Lawson and *Sr. Thomas Hanbury*.

Fruit and Vegetable Committee.

Present: Messrs. J. Cheal (vice-chairman), W. Wilks, Owen Thomas, F. Perkins, E. A. Buiyard, James Gibson, F. Jordan, W. E. Humphreys,

O. D. Tackett, A. Bullock, A. R. Allan, H. S. Rivers, E. Beckett, W. Bates and A. Grubb.

Messrs. J. CHEAL AND SONS, Crawley, were awarded a Silver-gilt Knightian Medal for a collection of Apples. The fruits were exceptionally well coloured, and in splendid condition generally. The more notable varieties were Beauty of Stoke, Hambling's Seedling, Alfriston, Winter Queen, Lord Derby, Egremont Russet, Fearn's Pippin, Christmas Pearmain, Newton Wonder, Crawley Beauty, Mother, Gascoyne's Seedling, W. Crump, Chas. Ross, Cox's Orange Pippin, Warner's King, Prince Albert and Sandringham.

A Cultural Commendation was awarded to Mr. EDWIN BECKETT for Tomatos Early Sunrise and Golden Sunrise. He also showed his new long-keeping Onion, Autumn Triumph, a flatfish, golden-brown variety, that grows to a large size.

Messrs. SUTTON AND SONS, Reading, showed a collection of vegetables, including Christmas White Cauliflowers; Scarlet Horn, Early Gem and Favourite Carrots; Late Drumhead Savoy, Matchless and Dwarf Gem Brussels Sprouts, Drumhead Kale, Curled Kale, New Year Savoy and Couve Tronchuda.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, and Messrs. Jas. O'Brien (hon. secretary), W. Bolton, R. A. Rolfe, J. Wilson Potter, Pania Balli, F. J. Hanbury, T. Armstrong, A. McBean, J. E. Shill, J. Charlesworth, C. H. Curtis, W. H. White, S. W. Flory, C. J. Lucas, R. Brooman-White, and the Rev. J. Crombieholme (visitor, chairman of the Manchester and North of England Orchid Society).

AWARDS.

FIRST-CLASS CERTIFICATE.

Odontoglossum Felice (*Thompsinianum* × *crispum*). From Messrs. CHARLESWORTH AND Co., Haywards Heath. The flowers are nearly as large, and of the same form as those of *O. crispum*, but with the colours of *O. Thompsinianum*. The sepals and petals are heavily blotched with dark claret-red, the outer third parts of the segments being light rose-colour. The variety shows a distinct advance in size and form, while retaining the rich colouring, of *Odium Edwardii*, one of the parents of *Odium Thompsinianum*.

AWARDS OF MERIT.

Cypripedium Lathamianum var. *Cardinal Mercur* (*Specterium magnificum* × *velosum*), from the Rev. J. CROMBIEHOLME, Clayton-le-Moors. The finest *Cypripedium* of its section, and equal to any in its fine size and shape. The large, flat dorsal sepal is white, with the lower two-thirds densely flaked and tinged with rich rose-purple, the colour being carried feather-like into the white upper part. The broad petals and lip are honey yellow, tinged with mahogany red, the margin being primrose yellow.

Odontoglossum Comptoni (*Illustrissimum* × *crispum*), from Messrs. ARMSTRONG AND BROWN, Orchardstead, Tunbridge Wells. A grand *Odontoglossum* of fine form and substance. The ground colour is white, with a tinge of purple, obtained from the dark colouring of the reverse of the segments. The sepals and petals are densely blotched with reddish-purple almost over the entire surface, as seen in some of the best forms of *O. Jasper*.

Odontodia Gratixie Bryndar variety (*Odium amabile* × *Odium Charlesworthii*) (see fig. 11), from Dr. MICHEL LACROZE, Rechempton. A fine dark red *Odontodia*, for which an Award of Merit was given to Messrs. Flory and Black on May 2, 1916. The present award is thus a confirmation of that previously given. It was not stated whether the plant now shown was the same as that exhibited on May 2 last, or one of the same batch.

PRELIMINARY COMMENDATION.

Odontoglossum Peter (parentage unrecorded), from Messrs. FLORY AND BLACK, Slough. A promising seedling, flowering for the first time. The flowers are white, with the inner parts coloured deep claret-red.

CULTURAL COMMENDATION.

To Mr. W. H. White, Orchard grower to Pantia Hall, Esq., Ashted Park, Surrey, for a fine plant of the scarlet Odontodia Keighleyensis, bearing six tall, branched spikes.

GENERAL EXHIBITS.

Messrs. ARMSTRONG and BROWN, Orchidist, Tunbridge Wells, were awarded a Silver Flora Medal for a group of seedling Odontoglossums, Odontodas, Cypripediums and hybrid Miltonas. Specially noteworthy were Cattleya Clotho (Triane x Emid), with a perfectly-formed white flower tinged with rose, the front of the lip being violet-purple with a narrow white margin; C. Percivaliana alba, white, with orange disc; a finely-coloured form of Odontoglossum Victory; and a promising and richly-coloured variety of O. eximillus.

Messrs. CHARLESWORTH and Co., Haywards Heath, were awarded a Silver Flora Medal for a group rich in good Odontoglossums and Odontodas. Brasso-Laelio-Cattleya Truffautiana (B.C. Mrs. J. Leemann x L.C. humilis) had fine, light-rose flowers with yellow disc to the fringed lip, and forms of Laelio-Cattleya Momus were specially attractive. Among Odontoglossums we noticed O. crispum xanthotes and O. ardenssum xanthotes, which seem to be obtainable in flower all the year.

Messrs. J. and A. McBEAN, Cocksbridge, were awarded a Silver Bankian Medal for an attractive group, principally of forms of Cymbidium Schlegelii, C. Alexandri and C. Doris. Odontodia Diana, 7da, Bradshawia and Oda Charlesworthi gave bright colours, and among others noted were the largest and best forms of Laeinaeops Chamberlainium.

Messrs. HESSLE and Co., Southgate, were awarded a Silver Bankian Medal for a group of their new Cymbidium sylvicolum (Pam. 55) and C. Beatrice (Lovanian x Schlegelii), varying in form and tint, but always beautiful. With them were other Cymbidiums of good quality.

Messrs. SANDER and SONS, St. Albans, staged a group in which the white Cattleyas Mary Sander and Snowflake were arranged with Cymbidium Gottianum, C. Doris, C. Alexandri and an interesting selection of species of the "botanical" class.

Messrs. FLORY and BLAIR, Slough, staged a group of Cymbidiums, seedling Odontoglossums and other Orchids. Specially good were Cypripediums Plum Langley variety (Lovanian x Chikabiyam x Victor Hugo), with large, clear yellow flowers of good substance, marked with chocolate-purple on the petals and dorsal sepal, the upper part of which is white, and Cattleya Zephyr (Schroderae x Dowiana aurea), with well-formed light rose coloured flowers, with dark rose centre to the lip, which has cream-white lines from the base.

Messrs. SHEPARD LOW and Co., Jarvisbrook, Sussex, showed the handsome rose coloured Brasso-Cattleya Penelope (B.C. Mad. Chas. Mason x C. Falcata), Sophro-Cattleya Blackie and the scarlet Sophronitis grandiflora.

Mr. J. E. SHILL, The Dell Gardens, Englebold Green, showed flowers of Cypripedium Eurycades The Barness and C. Eurycades The Dell variety, two magnificent flowers of the C. Eurycades class, the dorsal sepal of C. E. The Barness being 3 1/2 inches wide, white, with rich carotene blotches, the yellow and red brown petals being over 2 inches wide; Mr. SHILL also showed the wh. to Cattleya Astron.

NATIONAL DAHLIA.

JANUARY 15.—The annual meeting of the National Dahlia Society was held on Monday last, at the Hotel Windsor, Westminster. Mr. Joseph Cheal presided. The Committee's report for 1916 was read by the secretary.

EXTRACTS FROM THE REPORT.

The following are extracts from the report:—The Committee has again the pleasure of recording a satisfactory year's work. The season, taken as a whole, was not satisfactory for Dahlias, for atmospheric conditions were not conducive to satisfactory growth, whilst early frosts destroyed all hope of a prolonged season. The membership of the Society remains satisfactory under the present conditions.

The Annual Exhibition was held at the R.H.S. Hall, Westminster, on September 12, and was well up to the average standard, though there were rather fewer entries than in the previous year. Exhibitors from traders were not so numerous owing to the difficulties of labour and lessened railway facilities. The Amateur Classes however, were keenly contested, and the exhibits reached a high standard of excellence.

The Floral Committee appointed to act as a joint committee with the Floral Committee of the R.H.S. met on four occasions, when a larger number than ever of seedlings were submitted in all classes than in any previous year. Forty four awards were granted to novices. The awards were distributed amongst most sections of the flower.

The competition for the Cory Cup was held on the same date, and was productive of three fine exhibits. The Committee trust by next season more competitors may find it possible to enter for this valuable trophy, which has for its object the demonstration of the value of the Dahlia as a garden decorative flower.

The Committee have deemed it advisable to discontinue the conferences and publication of the Year Book for the present. The new varieties and selections of the last sorts in 1915 were, however, compiled and published in the Supplement and Schedule for 1916.

The Balance-sheet was as follows:—

T. Balance 1915	£ 8 1
Subscriptions and special prizes	6 3 8
Share of gate-money	63 12 0
Advertisements	1 15 0
	13 16 2
	£85 7 3
CR	
By Prizes	50 0 7
Medals, engraving etc.	1 5 0

Stationery, post, and circular	7 0 0
Hire of committee room	1 1 0
Chop-book	0 8 0
Postage	3 7 6
Balance in hand	14 0 9
	£85 7 3

Examined compared with vouchers and found correct.

GEO. DAVIDSON, Hon. Auditor.

The chairman moved the adoption of the report and balance sheet. The results, he said, were much more satisfactory than was anticipated at the end of last season; indeed, the Committee had made a stipulation in last year's schedule that, in the event of the income of the Society not being sufficient to pay the prize money in full, the winners would be paid less in equal proportion all round. Any reduction of prize money, however, was not necessary for when all claims were paid there remained a balance of £14. This balance was obtained by suspending the publication of the Year Book, and practising other economies. They had reason to be more than satisfied with the annual show of 1916, and the Committee was encouraged to go on with the activities of the Society, and to hold an exhibition in 1917. The report and balance sheet were adopted without further comment.

On the proposition of Mr. Jarrett, rule 4 was altered by making the date of the annual meeting January instead of November. It was explained that the later date would enable the Committee to present a complete report of the year's working, including a full statement of accounts.

Mr. D. B. Crane suggested that the special nurserymen's classes at the show should be open to all competitors, including amateurs, and the proposition was agreed to.

The meeting then proceeded with the election of officers. Mr. Reginald Cory was re-appointed president. It was explained that the president's absence from the annual meeting was unfortunately due to indisposition, and the chairman was asked to send him a letter expressing regret on behalf of the meeting. The vice-presidents were re-elected, and the names of Messrs. J. Cheal and J. A. Jarrett added to the list.

The committee was elected, and Messrs. D. B. Crane and H. P. Howard appointed new members to fill vacancies.

Mr. J. Cheal was re-appointed chairman, Mr. John Green, hon. treasurer, and Mr. J. B. Riding hon. secretary. The secretary was warmly thanked for his services, and asked to accept the sum of £10 as an honorarium from the Society. In returning thanks Mr. Riding stated that many foreign members were being admitted, and that American growers were keenly interested in the work of the Society. He could promise the meeting a large increase in the membership as soon as conditions were again normal.

SOUTHAMPTON ROYAL HORTICULTURAL.

JANUARY 1.—The annual meeting of the members of the Southampton Royal Horticultural Society was held at the Municipal Buildings. The Mayor presided. The statement of accounts showed that the increase for the year was £460 7s. 2d., of which £112 12s. 2d. was realised by the summer show and £38 10s. at a garden fête. The total expenses, including a small debt from 1915, amounted to £360 13s. 8d., and of this sum £207 13s. 7d. was expenses of the summer show and £27 16s. 6d. of the garden fête. The total cash assets amount to £54 3s. 6d., with liabilities nil.

Lord Swaythling was re-elected president, and the vice-presidents were also re-elected. Professor E. S. Lyttel, of the Hartley College, was elected chairman of the Council, and Mr. N. D. Desborough vice chairman. All the other retiring officers were re-elected, including the secretary, Mr. C. S. Fudge, who has held the office for forty-five years.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

JANUARY 8.—The monthly meeting of this society was held in the R.H.S. Hall on Monday, the 8th inst., Mr. C. H. Curtis in the chair. Two new members were elected. The sum of £88 9s. 1d. was passed for payment to the nominees of four deceased members, two of whom had fallen on the field of battle. The sick pay for the month on the ordinary side amounted to £80 18s. 1d., and on the State section to £24 16s. 6d., and maternity claims to £6. The financial statement was read by the treasurer and the trustees were empowered to invest £600 in the new War Loan. The new rules for the opening of a Juvenile Branch will be adopted at the next annual meeting.

NATIONAL ROSE. ANNUAL MEETING.

JANUARY 16. The fortieth annual meeting of the National Rose Society was held on Tuesday last in the Hotel Windsor, Westminster. There were about eighty present, and Mr. E. J. Holland presided.

The annual meeting was preceded by a special general meeting for the purpose of adopting new rules governing the constitution of the society, and these were accepted with a minor alteration as to the status of the auditors.

In opening the annual meeting the chairman stated that his first duty was to submit the annual report of the Council, together with the statement of accounts. The chief items in the report are as follows:—

EXTRACTS FROM THE REPORT.

The Council have again to report that the work of the Society has gone on successfully during the past year, and in view of the adverse war conditions the position of the Society must be regarded as highly satisfactory. Three Shows have been held, the Spring Show in the Horticultural Hall on April 14, the Summer Show at the Royal Botanic Gardens on June 30, and the Autumn Show on September 19 in the Horticultural Hall. Weather conditions prior to the Summer and Autumn Shows were not favourable, and the exhibits were hardly up to the usual standard either in number or quality, nevertheless, what must be regarded as fine collections of blooms were brought together on both occasions. The whole of the gate-money taken at the Summer Show, amounting to £76, was handed over to the British Red Cross Society.

No provincial show was found possible this year, but in order to give lovers of seedling Roses an additional opportunity of staging their production for the awards of the Society, the Council decided that, if it were possible, a special display should be held at the Horticultural Hall. The Secretary of the Royal Horticultural Society willingly co-operated, and generously arranged for ample table space at the fortnightly Show on July 18. The number of plants put on a great success, no fewer than 56 new varieties being staged, many of them of high merit.

During the year to date, nearly 320 new members have joined the Society, although for losses by death and resignation, the total number of members is now 437.

The total receipts for the past year, including a balance of £258 7s. 7d. brought forward, amounted to £5,325 12s. 4d., and the expenditure to £3,220 12s. 3d., leaving a balance at the Bankers of £1,105 0s. 1d.

With the deepest regret the Council have to record the death in September, 1916, of their President, Mr. Edward Marley. The Council desire to place on record their appreciation of his invaluable services and to

pay a tribute of affectionate regard to one whose name will always be held in high honour by the National Rose Society.

The Council have also to deplore the death of Mr. H. E. Molyneux, who for many years took an active interest in the affairs of the Society.

The Spring Show for 1917 has been provisionally fixed to take place on Friday, April 20; the Metropolitan Exhibition in the Royal Botanic Gardens, Regent's Park, on Friday, July 6; and the Autumn Exhibition on Tuesday, September 18; all these exhibits must be subject to the exigencies of the war.

The new combined "Official List of Names and Pruning Books" will be issued to members during January. The Rose Annual for 1917, containing a number of helpful articles interesting to amateur Rosarians generally, will be issued early in April next.

SUMMARY OF RECEIPTS AND PAYMENTS FOR THE YEAR ENDING DECEMBER 31, 1916.

		£3,323 12 4

The chairman, in moving the adoption of the report and balance-sheet, referred to the great loss the society had sustained in the death of the president, Mr. Edward Mawley, who had been connected with the society for forty years. The Council hoped when circumstances were more favourable to raise a suitable memorial to the memory of Mr. Mawley. They had also lost another valued member in Mr. Molyneux, who, at one time, held the office of treasurer. With regard to the society's work in 1916, Mr. Holland said that three shows were held as usual, and all were successful and worthy of the Society. The finances were satisfactory, especially considering the difficulties of 1915, for, after settling all outstanding accounts up to the end of December they entered the new year with a credit balance of £238 7s. 7d. Of this sum it was decided to present an honourarium of £100 to the hon. secretary, which would thus leave £138 7s. 7d. to the good. Subscriptions during the year amounted to £2,802 12s. 11d., which showed a falling off of £250, compared with 1915. Nevertheless, said Mr. Holland, only in two former years have the subscriptions been higher than in 1916.

The total income from all sources amounted to £3,323 12s. 4d. Economies have been effected in

* This has since been abandoned—see paragraph on p. 26.

various items of the expenditure, with the result that, notwithstanding a reduction in subscriptions, the Council has been able to purchase £1,000 Consols, 2½ per cent., at a cost of £547 12s.

Mr. C. E. Shea, seconded the adoption of the report and accounts. He did so, he said, with extreme pleasure, for the finances were splendid for such a time as the present. In no respect had the activities of the society failed in 1916. They had expended a sum of £1,000 less on the management than in the previous year, and had purchased £1,000 Consols. It was true that there was a smaller balance than in the preceding year. Yet they had no fear, for they had one great asset, comparable to what the painters described as "the under colour," and that was the great love of the rose to be found in all parts of the country. He was confident that the society would go on increasing and increasing.

The Rev. J. H. Pemberton asked whether the shows for 1917 would be held as arranged. In reply the chairman stated that the matter would be decided by the council later in the afternoon. The meeting then proceeded with the election of officers: Mr. E. J. Holland was elected president; Mr. H. R. Darlington, vice-president; Mr. S. A. R. Preston-Hillary, hon. treasurer; Mr. Courtney Page, hon. secretary; and Mr. Charles Braman, auditor. The vice-presidents and council were also appointed, the whole of the names as issued in the balloting list being elected.

Obituary.

WILLIAM HOULISTON.—We regret to state that Mr. William Houliston, curator of the gardens and museum of the Dumfries and Maxwelltown Astronomical Society at their Observatory and museum, Maxwelltown, died on January 9, after a protracted and painful illness. The deceased gardener, who was a son of the late Mr. Houliston, gardener, Carruchan, gained experience at important gardens in the South of Scotland and elsewhere. For a considerable number of years he was gardener to the late Colonel and Mrs. Blackett at Arbigland, Kirkcubrightshire, and while there was highly successful and was of great assistance in promoting the cause of horticulture in the locality. Some years ago he received his appointment at the Observatory, Maxwelltown, and fulfilled the duties there in an admirable manner, to the full satisfaction of his employers and of the public who visited the place. Mr. Houliston, who was 68 years of age, is survived by a widow and several sons and daughters. Some of the sons follow their father's occupation, and those at present in the Army, one of whom was recently severely wounded, occupy good positions.

ROBERTSON KIRKPATRICK.—*The Florists' Exchange* announces the death of Mr. ROBERTSON KIRKPATRICK, forester of the Park Commission, and landscape gardener of Nashua, U.S.A., who died on Dec. 20, aged 55 years. Mr. KIRKPATRICK was a native of Glasgow, and settled in America 33 years ago.

ANSWERS TO CORRESPONDENTS.

There are few gardeners, and still fewer amateurs, who do not on occasion require immediate information upon various points of practice. But either from an unwillingness to inquire, or from not knowing of whom to make the inquiry, they too often fail to obtain the information they are in want of. And let no one be alarmed lest his questions should appear trifling, or those of a person ignorant of that which he ought to know. He is the worst man who is conscious of his ignorance; for how little do the very really know—except that they know little. If one man is unacquainted with a fact however common, it is probable that hundreds of others in the same position as himself are equally in want of similar information. To ask a question, then, is to consult the good of others as well as of one's self.—*Gardeners' Chronicle*, Nov. 7, Vol. 1, January 7, 1851.

ADDRESS: D. M. VILMORIN, ANDRÉOUX et Cie., 4, Quai de la Mégisserie, Paris.

BIRDS AND FRUIT: *Gaulth*. The only effective method of keeping birds from ripe fruit is to place nets over the trees. Scaring with a gun will do much to keep the birds away, but you would

need to be amongst the trees very early in the morning and until nightfall. Failing the net or gun you must rely on the old-fashioned bird scarer, of which there are several types. Write to one of the horticultural sundriesmen. The pots for Peas should be drained.

GRAPE ROT: W. H. Dissolve ¼ lb. of iron sulphate in ½ gallon of water, and soak the rods thoroughly with the specific, which may be applied with a brush. If you add a few drops of sulphuric acid to the iron sulphate before mixing it with the water it will be an advantage. One pint of sulphuric acid is sufficient for 50 gallons of water and 25 lbs. of iron sulphate.

LICENCE FOR GARDENERS: W. G. A licence has to be taken out for practically every man-servant who is employed for private (as distinct from business) purposes. A licence is therefore necessary for gardeners permanently employed in a private garden; the cost is 15s. per annum for each man.

NAMES OF PLANTS: J. H. S. *Cyrtodeira fulgida*, a Gesneraceous plant, native of New Grenada.

PEAS UNDER GLASS: *Igorunus*. Assuming that you mean edible Peas, you will do well, considering the circumstances, not to attempt to grow this vegetable under glass in flowerpots, but rather to utilise some of your unheated pits for their cultivation, selecting dwarf varieties. You may either raise the seedlings in small pots—sowing five seeds in each 3-inch pot—and in due course plant them in the pits, or which would perhaps be the most satisfactory plan, sow direct in the pits. The essentials for success are a firm and not too rich soil, careful watering, and abundant ventilation whenever outside conditions permit.

The latter detail is especially important during the flowering period. If you can obtain clean shenders or fine gravel it would be better to place a layer 1 inch thick on the boards you mention rather than to attempt to grow plants on the bare boards, which exert an undesirable drying influence on the atmosphere. You might well make a hotbed in one half of your 30-foot-long pit, provided the remainder is boarded off. Beech leaves alone would furnish sufficient bottom heat to raise vegetable seeds such as Cauliflowers, Cabbages, Brussels Sprouts, Onions and Leeks, though the addition of straw manure would secure a more lasting heat. Whatever method you adopt, care should be taken to guard against over-heating before the seed is sown. Otherwise failure is certain. For the hotbed the trodden material should be at least 2 feet thick, and 3 feet would be better. Vegetables may well be raised in boxes in a cold frame, but in this case you should defer sowing until February at the earliest. The other frames could be utilised as you suggest, for pricking off the seedlings raised on the hotbed after they have been accustomed to the temperature of the unheated frame, and from thence you can safely transfer them to the cropping quarter. In these frames if the boards mentioned are close-fitting, it would be wise to make holes with an auger to provide drainage.

SALSAFY: M. E. I. M. This vegetable requires a light, rich soil which has been manured for a previous crop, so that no fresh manure need be applied. It is a deep-rooting plant, therefore the soil should be trenched to the depth of 2 feet and thoroughly pulverised, all stones being removed, so that the roots may not be retarded in their growth downwards. Sow the seeds in shallow drills early in May, allowing a distance of 15 inches between the rows. Thin the seedlings to 9 inches apart as soon as they are large enough for handling, and keep the ground well stirred with the Dutch hoe during the summer. Water the plants liberally in dry weather.

MARKETS.

COVENT GARDEN, January 17.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—ENDS.

Cut Flowers, &c.: Average Wholesale Prices.

s.d.s.d.		s.d.s.d.	
Arums, per doz.	7.0-8.0	Lilium longiflorum, long	5.6-6.0

		Tulip, scarlet, per doz. bun.	12.0-15.0
		Violets, single, Princess of Wales	4.0-5.0

Cut Foliage, &c.: Average Wholesale Prices

s.d.s.d.		s.d.s.d.	
Adiantum (Maidenhair Fern) best, per doz. bunches	8.0-9.0	Cycas leaves, per doz.	5.0-12.0
Asparagus plumosus, long trails, per half-dozen	2.6-3.0	Fern, French, per doz. bunches	0.6-0.8
— medium, per doz. bunches	12.0-18.0	— common	3.0-4.0
— Sprengeri	8.0-12.0	Ivy leaves, per doz. bun.	2.0-2.6
Bronze foliage	3.0-6.0	Moss, gross bunches	9.0-10.0
Carnation foliage, per doz. bunches	4.0-5.0	Myrtle, doz. bun. small-leaved	6.0 —
Croton foliage, per doz. bunches	12.0-15.0	— French, per doz. bunches	1.0-1.3
		Smilax, per bun. of 6 trails	1.3-1.6

French Flowers, &c.: Average Wholesale Prices.

s.d.s.d.		s.d.s.d.	
Anemone, double, pink, per doz. bun.	3.6-4.6	Narcissus-con. Sol d'Or, per doz. bun. of 6	2.6-3.0
— single, mixed, per doz. bun.	12.0-15.0	Ranunculus, per doz. bun.	6.0-8.0
Lilac, white, per doz. sprays	4.6-5.0	— Carmine, per doz. bun.	6.0-8.0
Mimosa (Acacia), per doz. bunches	10.0-12.0	— white, per doz. bun.	12.0-15.0
Narcissus paper white, per doz. bun.	3.0-3.6	Violets, single, per doz. bun.	3.0-4.0

REMARKS.—The scarcity of cut flowers, both white and coloured, continues. Chrysanthemums are almost finished, and their prices are still higher. Richardias and Laburns are scarce indeed, there is a great shortage of all home-grown flowers. Contributions from Guernsey are gradually increasing. They consist chiefly of yellow and white Narcissus, Buff Lily, self-flowering Euphorbia splendens, and Smilax. A limited supply of French flowers is arriving daily, and the blooms are seen bought at high prices. Paper-white Narcissus, "Mimosa," Violets, and a few anemones find a ready sale.

Plants in Pots, &c.: Average Wholesale Prices.

s.d.s.d.		s.d.s.d.	
Aralia Sieboldii, dozen	6.0-6.0	Cocos Weddelliana, 48's, per doz.	18.0-30.0
Asparagus plumosus nanus, per doz.	10.0-12.0	— 60's, per doz.	8.0-10.0
— Sprengeri	8.0-10.0	Croton per doz.	18.0-30.0
Aspidistra, per doz. green	24.0-36.0	Erica gracilis	10.0-12.0
Cacti, various, per tray of 15's	4.0 —	— melanthera	18.0-24.0
— tray of 12's	6.0 —	— byemalis	12.0-15.0
		— byemalis, in thumbs	4.0-6.0

Plants in Pots, &c.: Average Wholesale Prices.—con.

s.d.s.d.		s.d.s.d.	
Ferns, in thumbs, per 100.	10.0-15.0	Lantana borbonica, per doz.	12.0-30.0
— per 100, in small and large 60's	14.0-24.0	Lilium longiflorum, per doz.	36.0-42.0
— in 48's, per doz.	6.0-7.0	— lancifolium rubrum	24.0-30.0
— in 32's, per doz.	12.0-18.0	— album	24.0-30.0
— choicer sorts, per doz. 48's	8.0-12.0	Marguerites, in 48's, per doz.	12.0 —
Geonoma gracilis, 60's, per doz.	6.0-8.0	Pandanus Veitchii, per doz.	36.0-48.0
— larger, each.	2.6-7.6	Phoenix rupicola, each	12.6-21.0
Kentia Palmeriana, per doz.	4.0-8.0	Roman Hyacinths per box 24's	8.0-10.0
— larger, per doz.	18.0-36.0	Spiraea, per doz.	12.0-15.0
— Forsteriana, 60's, per doz.	5.0-8.0		

REMARKS.—Trade in this department is very quiet. Winter-flowering Ericas are almost finished, and there is no new subject to take their place. There is no great demand for flowering or foliage plants, and the majority of the salesmen's stands remain empty.

Vegetables: Average Wholesale Prices.

— X-medium	18.0 —	Nuts, Brazils, new, per cwt.	90.0 0
— Extra	20.0 —	— Coconut, per 100	25.0-31.0
— Double X	22.0 —	Oranges, per case	15.0-65.0
— Red, per ton	225.0 —	Peaches, per box	14.0-12.0
— Jamaica, per ton	£18 —	Pears—	
Chestnuts, per bag	20.0-25.0	— Californian	13.0-17.0
Cranberries, per case	19.0-20.0	— Keiffer, per barrel	35.0-40.0
Dates, per doz. boxes	7.0-7.6	Plums, per box	4.0-8.0
		Tangerines, per box	1.0-6.0
		W. I. B. s. s., per cwt.	56.0-80.0

REMARKS.—A number of English Apples are still obtainable, notably Braintree's Seedling, Dumbleton's Seedling, and Newton Wonder. Overseas varieties consist of several Nova Scotian kinds—King of the Pippins, Beauty and Blenheim Pippin. Shipments from California chiefly consist of Newton Pippins. A number of Californian varieties of Pears are available, including Winter Nells, Doyenne du Commerce, Glou Morceau and Easter Beurre. Cape fruits consist of Peaches, Plums and Apples. Black Grapes continue to be fairly plentiful, but supplies of Muscat of Alexandria are very limited. Apples of Ten-fold Tomatoes are also obtainable. Forest vegetables consist chiefly of Asparagus, Seakale, Mushrooms, Cumberes, Beans and Peas. Ordinary vegetables and roots are fairly plentiful for the time of year. E. H. R. Current Garden Market January 17, 1917.

Potatoes.

s.d.s.d.		s.d.s.d.	
Beiford	10.6-11.6	Blackland	10.6-11.0
King Edward	10.6-11.6	Evergood	10.6-11.0
Arran Chief	11.6-12.0	King Edward	11.0-12.6
Lincoln	11.6-12.0	Queen	11.0-12.0

REMARKS.—Trade is slow. Prices remain the same as last week. Supplies are moderate, and stocks in London are not very large. Edward J. Newborn, Covent Garden and St. Pauls, January 7, 1917.

Mr. W. C. Foote, recently Gardener to C. W. HAY, Esq., Shandon Court, Cambridge Wells, and previously for 5 years Gardener to E. H. CARTWRIGHT, Esq., Myskyns, Titchester, Sussex, as Gardener to Lady MABEL LINDSAY, Burcote House, Abingdon.

THE HORTICULTURAL DIRECTORY AND YEAR BOOK.

We much regret that the publication of the Horticultural Directory and Year Book for 1917 has been delayed by unforeseen and unavoidable circumstances. First, the difficulties in regard to printing and paper supplies have increased greatly of late; and secondly, the number of corrections that have to be made this year is altogether unusual, owing to the fact that so many gardeners have already sent us prepaid orders we offer our apologies for the delay, and assure them that everything possible is being done to expedite publication.

GARDENERS' CHRONICLE, Ltd.,
 41, WELLINGTON STREET, COVENT GARDEN,

HOTHOUSE BUILDERS,
HEATING AND ELECTRICAL ENGINEERS, etc.

Although we are at present employed largely on National War Service, we are still in a position to carry out urgent private work. We ask our patrons to give us as much time as possible for the carrying out of such work, so that we may arrange to have it done without reducing our War Service output.

THE HOME TIMBER TRADE IN 1916.

GENERALLY speaking, the post-war timber season has been one of the most prosperous that can be remembered. Not that all classes of timber have profited owing to the war, the main advances being in the price of pitwood, Ash of first quality, and wood suitable for the manufacture of boxes and rough packing cases. In the mining and manufacturing districts of England the home grown timber trade has been in a particularly flourishing condition, both demand and prices being generally spreading ahead of those reported twelve months ago.

Throughout the Midlands the trade has, to a greater or less extent, been affected by the war, both demand and price for particular classes of timber being abnormal. Transport, labour, shortage of boxes, and increased difficulties of transit generally have had an effect on the trade, and collieries, faced with a shortage of foreign timber, have fallen back on home supplies to an almost unprecedented extent. For the best selected Ash timber from 3s. to 3s. 4d per cubic foot was charged in one instance at least 4s. per foot was obtained while for prime Oak cuts the price was high, a goodly quantity having changed hands at from 2s. 6d. to 5s. 6d per foot. Selected Elm fetched as much as 1s. 6d. per foot, timber of smaller size about 1s. 3d. Beech sold well at all prices up to 1s. 6d per foot, and Spruce and Scots Fir 1s. 5d. for the best cuts. It should be remembered in conjunction with these seemingly high prices that they were for first class timber delivered at the various stations in Birmingham.

The war has materially affected the home timber trade in Yorkshire, and in the West Riding, where in colliery purposes vast quantities are required. The shortage of foreign supplies was early felt, and the demand for home grown timber was considerable. Fir poles, which in normal times could only be sold at 3d. per cubic foot standing in the woodlands, found a ready market at quite one third more. Alder and Birch have also benefited considerably, the prices ranging up to 1s. per foot for wood of best quality. Both are extensively used in the making of log sleds. Ash and Oak have been in demand, the former in particular being scarce on the market, and bringing good returns where plantation grown and fitted for carriage and other constructive purposes. Such timber of the best quality has increased in

price, and seasoned boarding has not been long on hand. For spool and bobbin making large quantities of timber have been required in order that heavy contracts for cloth might be carried out with expedition. In Berkshire and throughout Wiltshire generally there has been little advance in the price of home grown timber; at least any advance has not been general. Prices generally are low, good Elm fetching only 7d to 9d. per foot, Ash of prime quality 1s. 6d per foot, Larch 10d., and prime Oak 1s. 3d per foot. Public sales of timber in these districts have of late years largely given way to private dealings, and much of the produced timber is consumed within 50 miles of where it is sold.

In Norfolk there has been a demand in order to meet Government wants for shatts, and lumber wood, and material for packing munitions of war. Haulage of heavy timber has been much interrupted by the shortage of horses, and as Government supplies were required immediately, timber merchants have had a difficulty in coping with the unusual situation. Owing to heavy demands by the military authorities it has been found difficult to get timber conveyed by rail, and thus, with want of suitable labour, has considerably retarded deliveries. In Leicester some 700,000 ft. has been about as usual, and a log full of domestic timber, consisting principally of rough Oak, Elm, and Ash, changed hands at a price that would, a year ago, have been considered very good. In such cases it is difficult to state the selling price of individual timbers, but about 1s. 1d. per cubic foot was supposed to have been received. About 5,000 trees, principally Birch and Alder, fetched 7d. per foot in the woodland, and a small lot of Willow and Poplar, loggish trees about 50 feet each, sold well. They were evidently required for cutting into boarding for the despatch of war materials; the price obtained was 11d. per foot where felled fully convenient to a good road.

Around London and throughout the adjoining counties the home grown timber trade may be described as good, though the prices anticipated owing to the war have hardly been realised. Piprops at one time slightly advanced in value, and for really first class Ash timber good prices up to fully 7s. 6d per cubic foot were realised, but for other timber, excepting that for packing boxes, demand was not considerable. Larch has always a steady market in the Metropolitan area, and 1s. 3d. for that of big size and best quality was quite commonly paid. Owing to the scarcity of coal the demand for firewood was keen and prices good, and little was left on hand by the end of February. Egg-logs for lighting have gone up in value, and 3d. at a year ago sold at 3s. are now 3s. 6d per hundred. Coppice wood is about the old price, though charcoal for the troops has been in demand. Oak rails 4 from 1s. 6d. to 2s. 6d per cubic foot, the latter being largely used on the Thames for boat and barge building and repairing. The market for Elm was erratic, some parcels fetching 6d. and others only 1s. 5d. per foot. Some one hundred and twenty Apple trees, size 1, clean bolls, fetched 2s. 6d per cubic foot where approved.

Vast quantities of rough, home grown timber are being used in the manufacture of boxes and large packing cases for military and other uses. Scotch Pine timber, owing to its lightness and to its being procurable in good quantities, is largely used, but other light woods, such as Birch, Sycamore, Poplar, and Willow, are in demand. At Windsor, Scotch Fir of seventy years' growth was sold at 53s. per ton, free on rail three miles away, and 9 foot Sleepers (as such at railway stations). Of course, the larger and cleaner the timber, the more it is valued for such a purpose, and big Ellings of suitable materials have taken place in various parts of England. Willows for wicker baskets, in which shells are placed, are also in demand by the Government, but our home supplies are

except in a few special cases, rough and limited in quantity. The industry of basket making is an old one in this country, and it is pleasing to see it revived, though under unfortunate circumstances. The timber of the Poplar and Willow is particularly valuable for making certain classes of packing cases, owing to its tearing rather than splitting when subjected to rough handling, while for the sides and bottoms of carts that are to be used for the conveyance of heavy articles this timber is also in demand.

Quite recently large Poplar timber was sold at 1s. 4d. and upwards per cubic foot, and if a sufficient quantity could be got together of the black Italian and other species of the tree higher prices could no doubt be obtained for this wood. When we consider, too, that the Poplar is probably the fastest-growing tree that is cultivated in this country, producing, as it has been known to do, 2 cubic feet per annum for thirty years, the profits attached to a plantation of the species can be appreciated. Fortunately, too, dampish soils, where many other timber trees would not succeed, are eminently suitable for the production of the best class of Poplar timber. But there are other uses for which this timber is considered one of the best, notably in the making of railway brakes and weather-boarding. The grey or white Poplar produces excellent timber, even better than that of the black Italian; both, however, are by no means plentiful in any part of the country, a matter to be regretted when the price of the timber and ease with which it may be cultivated are taken into consideration. The Poplar is readily raised either from cuttings or seed, gives little trouble whilst under nursery management, is little liable to disease, and ripens the wood at the age of forty or fifty years. We would strongly advise those who have somewhat damp land to plant the Poplar for commercial uses.

In Scotland the past timber season is admitted to be one of the best that can be remembered. All classes of timber have not, however, profited by the war, the main demand being for pitprops and heavy timber suitable for the manufacture of rough packing cases. Ash for wagon build ing, too, has not been obtainable in the quantity required, and consequently the price has been steady, if not slightly in advance of that of the past few years. Firewood, such as Scotch Pine and Spruce, has been greatly in demand at prices which ranged from 6d. to 8d. per cubic foot, unfelled in the woodland; indeed, in Perthshire these prices were received for timber of the kinds specified at a distance of three miles from a railway station and double that distance from the consuming centre. In the same county the biggest and best Oak fetched up to 1s. 6d. per foot, though plenty smaller changed hands at from 3d. to 6d. per foot lower. Good, clean Ash fit for the best work brought in from 2s. to 2s. 5d. per foot, and the supply was limited and demand good. This was for white coloured Ash, that of darker graining only realising from 1s. to 1s. 3d. per foot.

Beech sold fairly well, the best cuts finding a market at varying figures up to 1s. 5d. per foot. Big Sycamore is always in demand, and bulky clean trees fetched 2s. 6d. per foot; extra clean round logs going even to 7s. 6d. Larch is about the same price as in England, namely, 1s. to 1s. 6d. for the largest and best trees, smaller ranging about 10d. per foot. For Wych Elm of large size 1s. to 1s. 2d. was accepted, but the logs were required to be over a foot square.

As showing the high prices ruling for home grown timber, Mr. Franco, of the Aberdeen Forestry Association, mentioned a case that he had come to his knowledge where a 10-acre plantation of Spruce trees of forty years' growth had been sold at the unprecedented price of £112 10s. per acre. Twenty miles from London I saw Spruce timber for which 1s. 4d. per cubic foot standing in the woodlands had been paid by one of our large railway companies. J. D. W.

THE CLUSTER OAK OF SAVERNAKE FOREST.

In November last I received from Mr. Arthur Yates specimens of a remarkable tree growing in Savernake Forest, Wiltshire, which, on account of its peculiar foliage, is locally known as the Cluster Oak. Only one tree of this kind has been noticed, and it is evidently a sport or mutation of the common Oak, which has arisen as a seedling, the cause of its abnormal characters being quite unknown. So far as can be ascertained, this sport has not been hitherto described by botanists, and may now be distinguished as *Quercus pedunculata* var. *cristata*.^{*} The leaves (fig. 13) are clustered together owing to the abbreviated growth of the shoot, and are twisted, very oblique, the midrib dividing the blade into two unequal parts, and much smaller in size than those of the species. In other characters, such as absence of hairs, two auricles at the base, and very short stalk, the leaves are normal. The acorns, usually only one developed on the peduncle, have a flattened apex with a depression containing the remains of the styles, and are quite glabrous. Acorns

FIG. 13. LEAF OF CLUSTER OAK, *QUERCUS PEDUNCULATA* VAR. *CRISTATA*.

from normal Oaks in Savernake Forest have a rounded apex surrounded by a zone of minute greyish tomentum, the terminal pit being absent or inconspicuous.

This peculiar form of sport has been noticed in other species of trees. The "screw-leaved" Holly (*Ilex aquifolium* var. *crispus*) is an example. The "cock's comb" Beech (*Fagus sylvatica* var. *cristata*, Loudiges), of which I have specimens bearing diminutive fruits from a tree at Durris, Kinross-shire, is very similar in appearance to the Cluster Oak. Loudon says that the wood of this variety, as shown in Savi's *Arborum Lignorum*, t. 3, f. 2, is quite different from that of the common Beech, being dark and curiously mottled and veined. There is also a similar sport of the Tulip tree (*Liriodendron tulipifera* var. *contorta*), of which there is a fine specimen at Fota, Co. Cork.

The Cluster Oak in Savernake Forest is a small, stunted tree (fig. 14), about 30 feet high, the stem measuring 5 feet 2 inches in girth at 5 feet above the ground. The tree generally comes into leaf later than the ordinary Oak. Mr. Yates says of some acorns of the Cluster Oak four years ago, but only obtained one seedling, which is exactly

* *Quercus pedunculata*, Ehrhart, var. *cristata*, A. Henry, vel *Quercus Robur*, L., var. *cristata*, A. Henry; *Quercus inaequalis*, F. v. p. var. *contorta*, obliqua; *Quercus glabra*, p. var. *depressa*. This sport, judging from the descriptions, is quite different from *Q. pedunculata* var. *crispus*, Kirchner or *Q. pedunculata* var. *heuteyi*, Zabel, forms with p. auricled leaves, which are sold by Continental nursery

like the parent in foliage and in slowness of growth. More acorns are being sown this year.

There are several points of interest to be noted. The Cluster Oak is a mutation, as it apparently comes true from seed. It is difficult to see how a mutation of this kind, which is an abnormality without vigour, could establish itself and become a new species. Most, if not all, mutations that occur in trees are similar bizarre forms. The coming true from seed is characteristic of many sports in trees. I saw last summer at Ashbourne, Co. Cork, three seedlings of the Cut-leaved Walnut, *Juglans regia* var. *laciniata*, which were identical in foliage with the parent tree at Stuttgart, from which the three nuts that were sown had been gathered by Mr. Beamish. Possibly in such cases true sexual reproduction does not occur. Parthenogenesis may be the explanation, fertile seeds being produced in the absence of pollen; and the offspring in consequence reproduce exactly the maternal parent. Such apogamic reproduction is not so rare in trees as is ordinarily believed. It is of common occurrence with the Wild Poplars, and often takes place when crosses are attempted in *Fraxinus*, *Juglans*, etc.

A. Henry

lime a dressing of lime at the rate of $\frac{1}{2}$ lb. to two square yards may be applied with advantage. Ordinary farmyard manure may be applied to average soils at the rate of 15 tons per acre (two good barrowloads per rod). Sulphate of ammonia and bone meal or superphosphate are suitable artificial manures. The sulphate of ammonia may be applied at the rate of $\frac{1}{2}$ lb. per rod; the bone meal or superphosphate at the rate of $\frac{1}{2}$ lb. per rod. Potash cannot be obtained at present, but any wood or plant ash which may be available should be applied.

PREPARATION FOR PLANTING.

The Potatoes to be used as seed should be placed in boxes or trays with the crown end uppermost. A compost consisting of leaf-mould, spent hops or ordinary soil mixed with some old well decayed manure, should be worked into the interspaces between the sets and over the top. The boxes should then be placed in a glass house or frame, where a night temperature of 60° to 55° F. can be maintained. The soil should be moistened with tepid water, and then shaded with bags or other suitable material for a few days. When the Potatoes have begun to sprout the shading material should be removed and the sprouts on each set reduced to two at the crown end. The leaf mould or soil will have the effect of encouraging the formation of white rootlets at the base of the sprouts, and care should be taken not to damage these in planting.

DISTANCE TO PLANT.

If the whole of the house can be devoted to the crop the Potatoes may be planted 12 inches apart in the rows and 12 inches between the rows; where it is desired to plant Tomatoes before the Potatoes are lifted, the distance between the rows should be 20-22 inches, and between the sets 6 inches. If possible, the seed should be about 2-ounce seed, or larger, but it may be that smaller seed will have to be used. From 15 to 22 cwt. of seed per acre (10 to 15 lb. per rod) will be required. If the seed has been well ripened it is advisable to cut a small portion from the base of the set immediately before planting. This ensures the decay of the seed, and seed tubers which decay after giving rise to plants usually produce stronger plants than seed tubers which do not decay. The rows may be made to run the length of the house or across, to suit the piping. The usual depth to plant is 4 inches. A trench should be made, the manures applied, the sets planted and covered over with some specially prepared soil. Old partially-exhausted potting soil is very useful for this purpose.

WATERING.

The usual custom is to saturate the soil thoroughly some days before planting. When it becomes workable, the sets should be planted at once, and no further water should be given until the soil shows unmistakable signs of dryness. Heavy waterings should not be given, but just sufficient to enable the tubers to swell. The water should be applied in the morning to allow as much of the moisture as possible to escape before closing the houses for the night. Ventilation should be given on every suitable opportunity. A night temperature of 50°-55° should be aimed at, with a rise during the day to 60°-65° with sun heat. Later, in spring, these temperatures will naturally rise with strong sun heat, but as much air as possible should be given during the day, to avoid a close, humid atmosphere inside the houses. Potato disease is very seldom troublesome, and no spraying is necessary.

GENERAL CULTIVATION.

The soil between the plants and rows should be kept as loose and friable as possible, and the stems should be earthed up as the plants grow; this encourages tuber production, helps the drainage and supports the haulm.

VEGETABLES.

THE CULTURE OF EARLY POTATOS UNDER GLASS.

THE following notes have been prepared by the Board of Agriculture and Fisheries for the guidance of those who may desire to grow a crop of early Potatoes under glass.

The following varieties are suitable:—

FIRST EARLIES.—Duke of York: A very early, kidney-shaped, yellow-fleshed variety. May Queen and Ninetyfold: Kidney shaped and white-fleshed. Epicure and Early Puritan: Round, white-fleshed varieties, the former being the heavier cropper. Sharpe's Express and Eclipse: Kidney-shaped, white-fleshed varieties, very popular in some early Potato districts. Eclipse is the later variety, but the heavier cropper.

SECOND EARLIES.—Royal Kidney and Countess: Useful on heavy soils. The latter is a flat, round, white-fleshed variety and a heavy cropper. British Queen: A strong grower of good quality and also a good cropper.

SOILS AND MANURES.

Light or medium loams are to be preferred to heavy stiff soils, although the latter may also be used. The soil in the houses should be dug as deeply as possible without hanging up the subsoil. If the soil is very rich or is deficient in

VARIETIES OF POTATO RESISTANT TO LATE BLIGHT.

In his seventh report* on Potato diseases, Dr. Pethybridge records the degree of resistance of varieties of Potatos to late blight (*Phytophthora infestans*). Clifden Seedling and Champion II are "practically immune"; K Seedling, said to be the offspring of Champion and Up-to-date, is nearly immune; Shamrock, Northern Invincible and Summit are strongly resistant; Arran Chief, Langworthy, Golden Wonder, What's Wanted, and Peacemaker, are feebly resistant; and King Edward VII. is susceptible. From these experiments, now continued over a number of years, Dr. Pethybridge draws the comforting conclusion that varieties of Potato are in existence which resist blight, and the foliage of which remains green and undecayed right up to the end of the season, without being sprayed, even in the extreme west of Ireland, where climatic conditions are usually favourable to the development of blight. At present, however, the most resistant varieties, by reason perhaps of other characters, do not find favour with the growers. It is noteworthy that the highly resistant varieties are somewhat slow growing, come through the ground later than most other varieties, and ripen off comparatively late. There are many other items of information in this bulletin, which we shall hope to deal with at a later date. In the meantime, we advise everyone interested in the scientific investigation of Potato diseases to read attentively the account of Dr. Pethybridge's work.

CULINARY PEAS

Your correspondents on intercropping (see pages 9, 19, and 307 last volume) agree in growing their edible Peas in rows only a few feet apart. I am convinced that for better crops may be obtained if the customary practice of growing garden Peas in a bed is departed from in favour of distributing the rows, as far as circumstances permit, over the kitchen garden. The plant food which is of the greatest importance to the Pea is present in very limited quantities in the soil, and by allowing plenty of room between the rows we give the important nitrogen-absorbing "nodules" much greater opportunities of performing their functions. In addition, isolated rows of Peas are less susceptible to attacks of mildew. Deep trenching for legumes is to be strongly advocated, but when this operation is accompanied by heavy dressings of animal manure much labour and material are wasted. Such rich food is suited to stem and leaf vegetables, in which succulence of growth is desired, but it does not encourage fruitfulness, and, as Cousins says in *The Chemistry of the Garden*, "Peas grown in this way are brought over and over again in the cost of production." Peas may profitably be grown on land which has been heavily manured for a previous crop, such as Celery, otherwise it would be better to work spent Mushroom bed manure into the trenches being prepared for the rows, than to use fresh dung. The value of a liberal dressing of fresh wood ashes well worked into the soil is probably greater than in the case of any other garden crop. I. C. B.

ORTHODOX CULTIVATION OF POTATOS.

GARDENERS generally are aware of the very accommodating character of the Potato plant, struggling as it so often does to produce a crop of new tubers in the most adverse conditions, but in view of the present shortage of labour and threatened scarcity of food it may be of interest to some to know of an easy way of producing a quantity of mid-season Potatos in odd corners of the garden by a method which I have found very successful here, and which entails the minimum expenditure of time and labour.

The idea first suggested itself to me as a result

of a chance remark let fall by a visitor from New South Wales, to the effect that one day, under his household shoot of Potatos, he went to a corner of his orchard where he had observed some Potato stalks growing up through some straw, and on clearing away the straw he discovered new Potatos "like nests of eggs" lying on the surface of the ground. It was some time before I realized that my friend was in earnest, but I quickly saw that, given a humid climate, there was nothing improbable in it, and resolved to try the experiment in a modified form the next season. A small piece of ground in a sunny position was selected and dug in the ordinary way in winter. About the third week in April this was levelled over, and on the surface were laid some well-sprouted tubers of an early variety, kept for the purpose at the usual distance apart given when planting. Some street-hedged material, which had served earlier in the year for forcing Rhubarb out of doors, was then lightly shaken over them to a depth of 6 or 7 inches, and on top of that about 7 inches of straw litter was placed, the bed being covered with a glass

since their beautiful specimens. The flavour of the tubers was excellent and their texture similar to that of the best early Potatos in spring—the latter quality in the month of August being very much appreciated by all who tested them.

I have no doubt that climatic conditions were an important factor in the success of the trial, and this point should be remembered. At the time these Potatos were set the weather was showery, and it continued so until the hail was well above the litter. A spell of hot, sunny weather then supervened, which provided ideal weather conditions for the formation of tubers. Also, no late frost came during that May—a most unusual omission for this district, although, of course, this contingency could easily be guarded against by shaking a little more straw over the shoots whenever frost seemed imminent. Other essential points which suggest themselves are the employment of well-sprouted "seed" of an early or mid-season variety, and not to "plant" too early in the season.

It is not intended to suggest that the method described here provides a reliable means of pro-

FIG. 14. THE CHESTNUT OAK OF SAVERNAH FOREST (See p. 11).

the outermost tubers all round. The hotted material originally consisted of stable litter and tree leaves, and, having been continually moved to get at the Rhubarb, it was quite cold and about half rotted.

Nothing further was done to the plot. In a few weeks the tops of the shoots appeared through the litter, and these developed, and in time showed flower. About the middle of June I cleared away a corner of the covering, and was delighted to find a quantity of small Potatos, the largest at that time being about 5 inches in length. Having at the time plenty of new Potatos besides these, I decided to give them a few weeks longer to mature, and we began using them about the first week in July, and continued throughout August.

I have often regretted since that I did not weigh the produce of that little spot, measuring only 10 yards by 3 yards. It certainly yielded a tremendous crop of fine Potatos, which were, moreover, of a beautiful appearance, having a clear skin quite free from blemish. I thought at the time that I had accidentally stumbled on the means by which some exhibitors of Potatos pro-

duce their main crop of Potatos. It is put forward only as a simple way of augmenting the early and mid-season crops, which this year are likely to be the most important in view of last season's shortage. Saving of labour is its chief advantage, no attention or work being necessary once the covering is put into position. The only disadvantage that occurs to me is that probably the tubers would not remain sound so long as those grown in the usual way, and so would have to be used first.

Climatic conditions vary in different parts of the country, therefore anyone desirous of trying this method for themselves should not do so on too large a scale the first season, but if their experiment is as successful as mine was they will certainly desire to extend it the following year. T. E. Tunplin, Bessborough, Co. Kilkenny.

CHRISTMAS POTATOS (see Vol. LX., p. 66).

THE result of my Christmas, 1916, Potato planting has again met with success, and from experience I find it will be better to plant the tubers not later than the middle of July and deeper into the soil than what may be usual.

* "Investigations on Potato Diseases," by G. H. Pethybridge, *Journ. of Dept. of Agric., Ireland*, XVI., 4.

Protect on against early frost by covering with stable manure or plenty of straw is all that is necessary. From 7 lbs. each of the following seed Potatos (cut in half) I obtained:—Dunnotar Castle, 35 lbs.; Carisbrooke Castle, 42 lbs.; Royal Kidney, 70 lbs., which yields would have been better both in size and quantity but for the inclemency of the weather during the latter part of the year. All the Potatos were absolutely free from any disease. *Joseph B. Holmes, Bowmore.*

HINTS ON PURCHASING "SEED" POTATOS

THE Board of Agriculture and Fisheries, in their leaflet No. 63, state that those who wish to grow Potatos successfully must attend chiefly to the following two points:—

1. The selection of seed, and
2. The preparation and manuring of the soil.

Another point, the prevention of disease, is of much importance in some districts, and for certain kinds of Potatos.

This leaflet deals with the first point only, the others being referred to in other leaflets. The immediate need of the grower who proposes to plant Potatos in March or April is to secure good "seed," and he should do so without delay.

THE "SEED" POTATO

The Potato "seed" or "set," is, of course, not a seed at all, but a tuber, and in this leaflet the word "seed" means "tuber"; the Potato tuber is a modified underground stem. Potato plants may be raised from true seed, and it is by this means that new varieties are commonly produced. When a new and promising variety is discovered it is propagated by its tubers until in time it may occupy many thousands of acres, but it is still in a sense an "individual" plant; unlike Wheat, each annual crop is not a new generation, and thus the Potato "grows old" (just as animals grow old), becomes enfeebled, and ultimately disappears. The rate at which a variety deteriorates depends on several circumstances. Each new variety of Potato has a constitution of its own, since it is a new "individual." Some kinds retain their vigour for a few years only, others for a long time only; thus the variety Up-to-Date has been common for about thirty years. It is now too old for many districts, but in others it is still useful.

None of the Potatos ripening from August onward can long stand cultivation in a hot and dry district. Thus, if Up-to-Date Potatos from Scotland were planted on well-cultivated dry soil in the South of England, the first crop would perhaps amount to 3 tons or more per acre; if "sets" saved from the crop were again planted, possibly 6 tons would result; but if the process were repeated, the third crop might not exceed 3 tons. If seed from Scotland were planted in South Lincolnshire the rate of deterioration would be less rapid, and the second crop might equal the first. It would ripen rather earlier, and as compared with fresh seed from Scotland the weight secured from the "once-grown seed" would depend chiefly on the character of the season. If, however, "twice-grown" seed were used, there would undoubtedly be a sharp fall in the yield of the crop.

A thorough change from the cool climate of Scotland or the north of Ireland is necessary to secure the best results in Potato cultivation. The degree of benefit to be expected from the change depends upon the variety of Potato, and is known to growers and dealers.

There are so many considerations to be taken into account that, in ordering seed, Potato growers who are not themselves familiar with the subject should always order through an experienced and reliable dealer.

It is recognised that for England generally it is desirable to have seed from Scotland or the north of Ireland at least every second year; unless this rule is followed the best results cannot be expected. Results ranging from fair to good may,

however, be secured by getting seed from the north of England, and generally by transferring seed from late to early districts. A change from peaty soil in a late district to a loam in an early district is often markedly beneficial. The benefits of a change vary with the seasons; after a cold and wet season, such as that of 1916, the quality of the seed Potatos grown in England, except in those districts where growth was arrested by drought in July, should be better than usual.

SIZE OF "SEED" POTATOS.

Potatos intended for seed are usually separated from cooking Potatos by dressing the tubers over a $1\frac{1}{2}$ inch or $1\frac{3}{4}$ inch riddle; those too small for cooking which pass through the riddle are again dressed over a $1\frac{1}{4}$ inch riddle so as to separate out very small tubers. The "seconds" thus obtained form the best tubers for seed purposes. It usually takes 2 cwt. of Potatos of this size to plant 20 square rods ($\frac{1}{4}$ acre).

When Potatos are scarce and dear, small Potatos which pass through a $1\frac{1}{4}$ inch riddle but remain on a 1 inch riddle may be used for seed; these are known as "thirds" or "chats," and early Potatos of this size are usually quite satisfactory. On rich, loamy soils and in moist districts, small tubers of second early and maincrop varieties are also quite reliable, but they are less satisfactory than ordinary seed size in dry soils. It is much better, however, to plant Scotch "thirds" than ordinary seed from crops grown for two years and more in England south of a line between, say, Hull and Chester.

"Thirds" are not only considerably cheaper than seed size, but they go further. About $1\frac{1}{2}$ cwt. will plant 20 rods; even 1 cwt. would suffice, but it is desirable to plant "thirds" a good deal closer than ordinary seed. The latter are generally placed 14 inches to 16 inches apart in the rows, the former 10 inches to 12 inches.

As the best Scotch varieties are very scarce this year they are being dressed for seed purposes over 1 inch riddles, so that "thirds" may not be procurable; but of the commoner sorts there will be an unusual number of "thirds" because of the very unfavourable season.

LARGE SEED.—Some of the most popular Scotch varieties, such as Arran Chief and Great Scot, are being sold "as grown," dressed over 1 inch riddles, no cooking Potatos being removed. This means that many of the tubers will be much too large for seed. When large tubers are planted whole the cost for seed is much enhanced, and the resulting crop is likely to consist of many undersized Potatos. In most cases large Potatos should be cut before planting.

CUTTING "SEED" POTATOS.—Some varieties, such as Up-to-Date and Abundance, stand outting well; others, such as King Edward and Ninetyfold, may be much injured by cutting; others again, such as Arran Chief, are uncertain. Cut tubers are always less safe for planting in dry soils than in moist loams, and are less satisfactory in a dry than in a moist spring, but every kind of Potato can be cut and successfully used under all ordinary conditions if carefully treated. Two points must receive attention. The grower should make certain that an "eye" or bud capable of growth is present in the set (if the Potatos have been slightly sprouted there is no difficulty in deciding as to this point), and the cut surfaces should be sprinkled with slaked lime which forms a crust and prevents the Potato drying after it has been cut. This is especially necessary if there is any likelihood of delay between cutting and planting.

SPROUTING "SEED" POTATOS.

This means starting the growth of the Potatos before planting. The usual practice is to place the tubers in shallow trays or boxes (hence the method is often called "boxing" Potatos) so that the tubers may start growth in the early spring months. When properly carried out the practice is most useful and results in a much earlier

crop of early varieties and, generally, in an earlier and larger crop of the later kinds. Those who intend sprouting sets must be prepared to carry out carefully the instructions given. If, through inattention, the sprouts grow long and weak, the crop will be much injured.

HOW TO SECURE "SEED."

The only way to secure a supply of satisfactory seed in most districts this season will be for growers to combine and make up joint orders. If possible, arrangements for consignments of at least 4 tons should be made, as this will effect a saving in carriage.

The Board have asked the War Agricultural Committees to endeavour to arrange for the joint purchasing of seed Potatos, and also to give every possible encouragement to allotment societies or to clubs specially formed for the purpose of securing good seed. The quantity of seed to be distributed to any one grower under this scheme must not exceed 5 cwt.

In Somersetshire, last spring, a very successful scheme was carried out by means of which nearly 200 tons of Scotch seed Potatos were distributed in lots of 5 cwt. or under to growers throughout the county. Similar schemes were adopted in other counties with good results.

The essential preliminaries of schemes of this kind are: (1) the holding of local meetings of those interested for the purpose of appointing a correspondent to collect orders and forward them to the officer nominated by the War Agricultural Committee to act on behalf of the county; (2) the selection of varieties. As a rule the choice should not exceed two or three sorts, otherwise the distribution becomes troublesome.

Local residents who wish to purchase should be invited to state the quantities needed, and the county officer will appoint a day by which all orders must be sent in. He will then complete the purchase, and have the Potatos consigned to convenient stations.

All requests for information as to procedure should be addressed to the Secretary of the War Agricultural Committee of the county concerned.

THE KITCHEN GARDEN.

By J. DRAY, Foreman, Royal Gardens, Windsor.

CABBAGE.—The soil between the rows of Cabbages should be hoed as soon as the surface is dry enough. Make good all failures with plants from the seed bed, and give frequent dustings with soot or lime to keep slugs in check. The surplus plants in the seed bed should be transplanted 4 inches apart in nursery beds with a view to making further plantations in March. If the stock of plants is insufficient for requirements make a sowing of an early variety forthwith. Sow the seeds in boxes and germinate them in gentle warmth. When the seedlings are large enough to handle transplant them in frames. If liberal treatment is afforded them the plants should be ready to plant out early in April. Express is a good variety for the purpose.

BRUSSELS SPROUTS.—A small sowing of Brussels Sprouts should be made now with a view to producing plants for early supplies. Sow in boxes and germinate the seeds in gentle warmth. Remove the seedlings at an early stage to a position close to the roof-glass and ventilate the house or frame to promote sturdy growth. Prick the plants out in a cold pit as soon as they are large enough for transferring, allowing a space of 4 inches each way. When they have become re-established, open the lights freely during fine weather, and remove them altogether as the season advances. Ideal and Dwarf Gem are two good varieties for present sowing.

PEAS IN POTS.—To obtain early pods from plants in pots sow the seed at once. Pots 8 inches

in diameter are best for the purpose, they should be carefully crooked and filled to three parts of their depth with rich soil, moderately firm. Sow sufficient seeds to ensure a full crop; the surplus plants may be removed when they are well through the surface. Any warm house is suitable for this crop, which needs plenty of light and fresh air.

RHUBARB.—Roots of Rhubarb should be exposed to the weather for a few days before they are placed in the forcing-house. A warm pit or house should be chosen, and the roots should be placed as closely together as is possible. Fill in the spaces between the clumps with light, rich soil, which should be thoroughly moistened with water at a temperature of 70°. If new plantations of Rhubarb are to be made, prepare the ground at once by trenching it to the depth of 2 feet, and enrich it with a heavy dressing of farmyard manure.

WINTER BROCCOLI.—Beds of winter Broccoli should be examined frequently and protection afforded as it becomes necessary. A few leaves carefully placed over the crowns will protect them from moderate frost, but in very cold weather Broken Fan should be used.

DIGGING AND TRENCHING.—The work of digging and trenching should be pushed forward as quickly as possible, so that when the time arrives for planting most of the ground will be in readiness. Move the soil as deeply as circumstances permit and leave the surface rough and open to allow the frost and air to enter.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northbrook, Eastcote Park, Kent.

THE SELECTION OF FORCING SHRUBS should include Magnolia, Cyclonea, Myrtina, Almond, Daphne, Cytisus, Forsythia, Hydrangea, Laburnum, Philadelphus, Prunus triloba, Viburnum Opulus (Guedler's), Rosa, Scaphylococcinea, A. and N. goudouana, variegata, W. goudouana, Rubria and Crataegus (Thomas). Most of these plants may be purchased as standards, half-standards, pyramids and bushes. In forcing standards, pyramids and bushes, if in forcing sheds or pits, be the roots have copious supplies of water at all times; a stunted, stunted appearance of the blooms immediately suggests continued drought at the roots.

PERPETUAL FLOWERING CARNATIONS. Make it a rule to admit, if possible, a little fresh air to Carnation houses each day for as long as the outside conditions permit. Do not maintain high temperatures by the use of much fire-heat, for this would result in weakened growth and blooms that lack substance. The night temperature should be maintained at 42°, but it is better to allow it to drop a few degrees on very cold nights than to use much fire-heat. Open the ventilators a little as the temperature rises in the morning, increasing the amount of fresh air when the glass registers 55°, allowing for a rise of 5° to 10° with sun heat. When the weather turns mild after a spell of cold do not suddenly admit much air; guard against draughts, and gradually inure the plants to the changed conditions. It is not wise to use much concentrated fertiliser during mid-winter, but now that the days are lengthening a top-dressing will benefit the plants during the next month or two. Mix the manure with about six times its bulk of fine, sandy soil, and use a little or more, according to the condition of the plants. Plants raised from cuttings inserted last month are ready for shifting singly into small pots. Use light, sandy soil, and do not expose the plants to cold, or they will suffer a check. When potted, place them on a bed or stage near the roof-glass, and not on a dry shelf. They will grow best in a low house or pit, the pots standing on a moderately damp bottom. In such conditions the roots will require very little water until they become more active. Spray the foliage on bright mornings and admit a little air whenever the weather is favourable for ventilating. The temperature of the house should range from 55° to 60° with air, allowing it to rise with sun heat, and fall to 50° at night.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVENY, A.M., 15, Wood, Goldalough, Surrey.

PRUNING.— Endeavour to complete the work of pruning, and especially of wall trees. Cut back old spurs which have become ragged and project a long distance from the wall. It will be noticed that certain varieties of Pears fruit on the ends of the shoots, and such shoots should be retained. Pear trees did not fruit well in 1916, and they do not promise very well for fruit next season; a few, however, are studded with fruit buds. The same remark is true of Apples. When the pruning is finished, examine all the old-ties, and replace any that require it. Strong tarred string after two years should also be very closely examined, or the ties may do serious mischief in cutting the bark. Train the ends of the branches in a regular manner, so that the work will look business-like when complete.

RED AND WHITE CURRA.—These bush fruits are grown in a variety of forms. In pruning those trained against wire supports as double cordons and those in gridiron form tie the top shoots and prune the lateral growths to two or three buds. The leading shoots of bushes and young, untrained plants may be shortened to 7 inches to form well-shaped specimens; the side shoots of these should be shortened to two eyes. Old-established bushes that are not required to extend beyond their present size should be pruned hard uniformly all over the plant. Examine the stakes and renew any that have decayed, making them firm in the ground.

BLACK CURRANT.—Examine Black Currant bushes for "big bud," and remove all infected buds and burn them. If the bushes are badly attacked grub them up and burn them. In pruning bushes keep them a good shape, and remove some of the oldest wood to make room to train in new growths arising from the base. When the pruning is finished rake up all rubbish and scatter lime over the soil and trees freely. This is the best method making a new plantation of Black Currants should choose a fresh site. The best varieties are Black Naples, Baskoop (Grand and Champion). The bushes should be pruned and the first year after planting to ensure a good foundation for well-developed growth.

THE ORCHID HOUSES.

By J. COOPER, Gardener to Sir JEREMIAH COLEMAN, Bart., Garden Park, Reigate.

DECIDUOUS CALANTHES. The majority of these useful winter-flowering Orchids will have passed out of flower, and after the flower spikes are removed the plants will require a decided rest. Some growers prefer to allow them to remain in the pots, in which case they should be placed in a dry position on a shelf near the roof glass in a temperature of about 55°. It, however, space in the houses is limited, the pseudo-bulbs may be turned out of the pots, a portion of the old roots cut away, leaving just sufficient to hold the pseudo-bulbs in an upright position when next potted, all scale insects removed, and the plants placed close together in shallow boxes, with a mixture of equal sphagnum moss and silver sand round their base. Withhold water entirely from the roots. The late-flowering species such as C. Reginaldi, C. Williamsii, C. Stevensii, C. nivalis and C. Sanderiana and their hybrids, should be afforded water at the roots occasionally. If their strong flower spikes are gently bent over during their stages of development, causing them to extend in an arched direction, it adds greatly to their usefulness for decorative purposes.

FRUITS UNDER GLASS.

By JAMES HEDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., C.M.G., Gunnersbury House, Acton, W.

THE COLD ORCHARD HOUSE.—Whether the trees in the unheated orchard house are in pots or planted in borders, they should be overhauled thoroughly, for the early varieties are already on the move. Some amount of pruning is needed forthwith, but I prefer to do the principal pruning over an extended period to

obviate the danger of cutting away shoots that might produce fruit. The trees should be syringed thoroughly with an insecticide, and the paintwork and glass cleaned immediately afterwards. Later, just before the flowers open, vaporise the house with a nicotine compound. It is too late to re-pot the trees, but those that were not potted last autumn should receive a top-dressing. Soak the borders in which trees are planted, and apply a top-dressing. Keep the house quite cool.

PEACHES AND NECTARINES.—I have noted during the past week that trees which have been forced for nearly 20 years are swelling their buds. The trees are all in pots, which have been arranged at the usual distances apart. But I shall use no fire-heat, nor close the houses for the present, my object being to retard growth for as long as possible. The trees will, however, be vaporised at once with nicotine, and again just as the first flowers are expanding.

APPLES AND PEARS IN POTS.—I do not consider it expedient in the present circumstances to continue the cultivation of Apples and Pears in pots under glass. Where there are such trees I advise the plunging of the pots over their rims in an open, sunny position out of doors.

OTHER ROUTINE WORK.—Complete the work of training and tying the shoots of all Peaches, Nectarines and Figs under glass as soon as possible, for even the latest trees will soon be showing signs of growth. It is most important to preserve cleanliness in both trees and houses. Late vines should be tied into position as soon as the cleaning is done. Where mildew was present on the vines last year guard the crop against it this season by adopting remedial measures, sulphur being one of the best specifics. So that all inside borders are well watered.

THE FLOWER GARDEN.

By W. J. GRICE, Gardener to Mrs. DEMPSTER, Kew.

SUMMER BEDDING PLANTS. Pelargoniums that were raised from cuttings inserted last autumn should receive attention. Those rooted in boxes should be shifted into 3-inch pots, and others inserted singly in 3-inch pots shifted into pots two sizes larger, using a compost of loam, leaf-mould and sand; soil from old Chrysanthemum stools, mixed with leaf-mould and sand, is also suitable. Grow them in a warm house or frame until they are well rooted, when they should be removed to a cooler plant-house. Old plants of Pelargonium may be placed in place to furnish cuttings at an early date, to replace failures. Marguerites, Fuchsias, Salvia, Heliotropes and similar plants should be shifted into larger pots directly they require more root-space. Lightly fumigate the house or pit occasionally to keep down insect pests. Ageratum, Coleus, Fuchsia, Lobelia, Verbena, Alyssum and other stock plants should be placed in a warm, moist house; they will quickly produce plenty of cuttings for propagating. Specimen plants required for tubs, vases, or bedding purposes need the growths regulating occasionally, to secure evenly-balanced heads. Calceolarias, Pentstemon, Antirrhinum and Marguerites growing in cold frames need ventilating carefully. Directly the plants are tall enough pinch the tips of the shoots to encourage the development of side growths. Pinch out the flower buds of Viola and Pansies growing in frames. The scarier varieties of Dahlias may be potted and placed in gentle warmth to produce shoots for cuttings.

SEED-SOWING. Provided seed of Hollyhock is sown at once, the majority of the seedlings will flower this year. Let the pots or pans be well drained, and use a compost consisting of loam, leaf-mould and sand. Germinate the seeds in a temperature of 65°. Pot the seedlings singly in 3-inch pots as soon as they are large enough to handle. Other seeds that may be sown now, requiring similar treatment, are Acaenolophanta, Grevilla robusta, and Pentstemon, Verbena venosa and Canus should be raised from seed sown in considerable heat. The seeds of Canus are very hard and germinate slowly, therefore place them in warm water for several hours before sowing.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W. C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or reference to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JANUARY 27.—National Acclimata Soc. (Northern Section) Annual Meeting.
 TUESDAY, JANUARY 30.—Roy. Hort. Soc. Com.'s meet.
 THURSDAY, FEBRUARY 1.—Manchester and N. of England Orchard Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 39.6°.

ACTUAL TEMPERATURE.—Gardens' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, January 25 (10.0 a.m.): Bar, 29.6"; temp., 33.0"; Weather—Dull.

SALES FOR THE ENSUING WEEK.

WEDNESDAY.—Bulbs, Herbaceous Plants, Rhododendrons, Roses, Fruit Trees, &c., at 67 and 68, Cheap-side, E.C., by Protheroe and Morris, at 12 o'clock. Bulbs, Grass-Seed, &c., at 2 o'clock. Japanese Lilies and variegated Lilies, at 5 o'clock.
 THURSDAY.—Roses, at Protheroe and Morris's Rooms, at 1 o'clock.
 THURSDAY AND FRIDAY.—Fruit Trees and General Nursery Stock, at the Nurseries, Epsford, Kent, by Protheroe and Morris, at 11 o'clock.
 FRIDAY.—Bulbs, Plants, Rhododendrons, Roses, Fruit Trees, &c., at Protheroe and Morris's Rooms, at 12 o'clock.

Revised Potato Prices for 1917.

The decision of the authorities to make the price 115-130s. per ton a minimum and not a maximum will be welcomed by Potato growers generally.

The view which we have expressed already in these pages is, we are sure, the right one; namely, that the country cannot afford to reduce production of this important vegetable. We earnestly hope that careful and prompt attention will be given to the further suggestion which we made, namely, the provision of means of dealing with a surplus of Potatoes in the happy event of there being a glut.

In this connection it may be noted that the increase in the number of pigs will automatically provide one means of absorbing a large quantity of inferior Potatoes. Germany, as is well known, uses in normal times as much as 40 per cent. of its enormous Potato crop for feeding pigs. How much of its crop it dries we do not know, but that we ought in this country to erect several large-scale Potato drying plants can be scarcely gainsaid. It should not be a difficult piece of work.

There are Belgians and others here who have had experience in the large-scale drying of Potatoes and other vegetables. The Board of Agriculture has, we believe, been actively encouraging the drying of vegetables. It should prove a benefit to Potato growers, not only in the coming year but always, if any surplus crop could be absorbed for drying purposes, and also for starch and alcohol production. It would be necessary, no doubt, for the State to take the initiative in this matter, for it alone is in a position to buy in advance on favourable terms.

There can be little doubt that the erection of plant for Potato-drying in the chief centres of production, even if it were only undertaken as a war measure, would prove so advantageous that the practice of drying would be continued after the war.

The Australian Grey Mangrove.

Of the genera Rhizophora, Sonneratia and others which make up the dominant features of Mangroves, not the least interesting is *Avicennia*. Of this genus the *Key Index* enumerates 14 species but allows only two, *A. officinalis* and *A. nitida*. Mr. R. T. Baker, the curator of the Technological Museum, Sydney, who has published recently* an interesting account of *Avicennia officinalis*, is of opinion, however, that investigation will prove that more than the two species exist. The Grey Mangrove of Australia, *A. officinalis*, is a plant of some economic importance inasmuch as its remarkable pneumatophores (breathing roots) are unrivalled as nurseries for oysters.

Unfortunately, those who cultivate oysters have found considerable difficulty in establishing the tree, and one of the most interesting and valuable of Mr. Baker's observations appears to supply an explanation of, and a remedy for, overcoming, the difficulty.

It should be premised that the pneumatophores are, *par excellence*, the "breathing" organs of the plant. The leaves of *Avicennia* have for their functions rather the storage of water than the admission of air, and, indeed, contain few or none of the stomata or "breathing pores" which occur in such vast numbers on the surface of ordinary leaves. In *Avicennia* the pneumatophores are roots which, refusing to obey the ordinary rule of gravitation as applied to roots, grow vertically upward out of the ooze or mud of the Mangrove swamp in which the tree is anchored.

The leaves have, however, another function beside that of storing water, and one which is altogether novel to our knowledge. The trees of this "Grey Mangrove" stand at an angle with the foreshore and all the leaves face the north, and thus, interposing their thickness between the midday sun and the breath-

ing roots, act as an effective sunshade, protecting the delicate tissues of the pneumatophores from the heat of the sun. In confirmation of this interesting conclusion Mr. Baker has observed that whenever the breathing roots are exposed for any length of time to the sun's rays they perish, and with them also perish the branches of the tree on the same side as that occupied by the sunstruck pneumatophores. Wherefore Mr. Baker is able to give comfort and advice to the oyster cultivators, and holds out the promise that if they will but shade their recently planted *Avicennias* they will be able to establish both them and the oysters.

CALANTHES AND FOG. On p. 241, November 18 1916, a note on the fine house of *Calanthes* in the gardens of W. K. D'ARCY, Esq., Stanmore Hall, Stanmore, then commencing its show of flowers, was given, together with the method adopted by Mr. TAYLOR, the head gardener there, to counteract the bad effect of fogs on these flowers in the neighbourhood of London. The fogs have been very heavy this season, and many batches of *Calanthes* in the metropolitan area have had the greater part of their blooms destroyed. A visit to Stanmore Hall gardens last week proved that Mr. TAYLOR's treatment had been successful, the house of *Calanthes* throughout being in perfect condition, and not a flower damaged by fog. *Calanthe Bryan*, with its fine sprays of white flowers with dark blotch at the base of the lip is the favourite. C. William MURRAY, raised by the late NORMAN C. COOKSON from the same parents as C. Bryan, stands next, and the bright pink C. *Vaitchii superba*. To prevent ill-effects from fog, Mr. TAYLOR closes the ventilators when fog comes on, and slightly raises the temperature of the house until the troublesome time is past.

LECTURES ON VEGETABLE CULTIVATION.—A series of lectures on the cultivation of vegetables is being delivered by Mr. E. R. JAMES, Horticultural Superintendent, University College, Reading, in the Hall of the University. The meetings are intended to assist beginners, and are open free to all. The syllabus deals with current work for the period intervening between the meetings, which are held fortnightly, the next being on the 7th prox.

SWEET PEA TRIALS ABANDONED.—The Committee of the National Sweet Pea Society has decided to abandon the novelty trials of Sweet Peas for the present year.

THE INSECT POWDER PLANT.—An interesting account of the cultivation of *Chrysanthemum cinerariaefolium*, the plant from which "insect powder" is produced, is given by Mr. HOLMES,* who believes that the plant would prove easy of cultivation on the warmer South and South-West coasts of England. The plant C. *cinerariaefolium* is native of Dalmatia, where it grows on sunny, pebbly and chalky hillsides. The best price is obtained for unopened flower-buds, and the industry of cultivating the plant is said to be a very profitable one in Dalmatia.

TRIALS AT WISLEY.—The R.H.S. will, if the supply of labour permits, conduct trials of Late Peas, Broad Beans, Beet, Onions, Shallots, Leeks, Wart-resistant Potatoes, Stocks (annual), Eschscholzia, and Annual Poppies, at their garden at Wisley during the coming season. Seeds and bulbs for trial should be sent to the Director of the Gardens not later than the 31st inst.

* The Australian "Grey Mangrove," *Journ. of Proceedings of the Roy. Soc. of N. S. Wales*, XLIX., p. 257.

* *Pharmaceutical Journal*, Jan. 6, 1917.

CAMPANULA STANSFIELDII. (see fig 15).—*Campanula Stansfieldii* first appeared as a chance seedling in Mr. W. H. STANSFIELD'S nursery at Southport in 1893, and is supposed to be a hybrid between *C. carpatica* and *C. Wardstaniana*. The flowers are borne on thin, waxy stems, about 6 inches high, and are coloured rich violet-purple, a shade almost as deep as in *Campanula pulla*. The plant was a favourite with the late Mr. WOOTLEY DOW, who described it as the best hybrid *Campanula* of his time. *Campanula Stansfieldii* delights in plenty of sunshine, and in conditions that suit it the plant makes a strong, vigorous clump. The foliage is yellowish-tone, which is not uncommon amongst hybrid *Campanulas*. The plant illustrated is reproduced from a photograph taken by Mr. MAIRY in Miss WHEATMORT'S garden at Great Warley, Essex.

SPHAGNUM-MOSS IN SURGERY.—The use of *Sphagnum*-moss as an aseptic dressing for wounds is said by Mr. ALAN McCLEICHON* to be an ancient practice, and not, as is sometimes claimed, a modern German discovery. Linnaeus, in *Flora Lapponica*, records that in Lapland it was used for treatment of ulcers. Tradition tells that at the battle of Flodden the Highland soldiers staunched their wounds by means of bog Moss and soft Grass.

TRADE WITH RUSSIA.—H.M. Consul at Ekaterinburg (Mr. T. H. DUNSTON) reports that a merchant in that town desires to receive catalogues from United Kingdom growers of summer, winter, and hothouse flower seeds, and vegetable seeds, including Radish, Cabbage, Cauliflower and Carrot seeds; also catalogues from United Kingdom manufacturers of gardening implements, such as hoes, rakes, clippers and cutters, hoses and watering cans. All these goods are required to replace goods formerly obtained from Germany. United Kingdom growers of flower and vegetable seeds and manufacturers of gardening implements, desirous of doing business in the Ekaterinburg district, should send catalogues to the British Consulate at that town for transmission to the inquirer. In sending such catalogues the reference (Misc. No. 191) should be quoted. *Board of Trade Journal*.

LECTURES AT THE LONDON UNIVERSITY.—A course of ten public lectures on the "Exploitation of Plants" arranged in co-operation with the Imperial Studies Committee of the University of London, is being delivered in the Botanical Department at University College, Gower Street, London, W.C., on Mondays, at 5 p.m. The first took place on the 22nd inst., when Prof. F. W. OLIVER delivered an introductory to the course. Lecture II.—"Plant Food and Soil Problems." Professor W. B. BOTTOMLEY, F.R.S. (King's College, London). Lecture III.—"Timber Production in Britain." Dr. E. J. SALISBURY (East London College). Lecture IV.—"Cotton." Dr. W. LAWRENCE BAILEY (Manager, Cotton Investigations Department, F.R.S. and D.A.). Lecture V.—"Tea-Making." Dr. S. E. CHANDLER (Imperial Institute). Lecture VI.—"The Plant as Healer." Dr. ERNEST THOMAS. Lecture VII.—"Tropical Exploitation, with especial reference to Rubber." Dr. JOSEF C. WILITS (lately Director of Botanic Gardens, Rio de Janeiro). Lecture VIII.—"Vegetable Dyes." Dr. SARAH M. BAKER. Lecture IX.—"Diseases of Plants." Dr. H. C. I. GWYNNE-VARNEY (Birkbeck College). Lecture X.—"Plants as the Source of National Power: Coal." Dr. MARIE C. STROPS. Admission is free, and no tickets are required.

GARDENING IN EGYPT.—The *Fidd* for January 13 publishes the following interesting letter on gardening in Egypt from a correspondent in Gizeh: "Having decided to pass the evening of my life in Egypt, I have built myself a small

house in the ever fertile fields of this country. I feel that in my old age a garden, in this climate and with three of the most beautiful views that man can imagine, will be a great resource. In this country the sun shines every day and all day for 360 days a year, and the rain is, so to speak, on tap; I mean that our only source of cultivation water is the irrigation water supplied by the Government. In winter there is, every five or six years, a slight wind frost; but you can judge of the winter climate by the fact that from December 1 on is the time for Roses and Strawberries, Roses being magnificent here and most easy to grow. In summer we get 85°-95° Fahr. for several months, and generally a few days on which the temperature rises to 110°-117°. The dryness of the atmosphere prevents us from growing many plants of the equatorial zone; for instance, *Stephanotis* grows and flowers splendidly in autumn and winter; but in summer it requires care, or one day it quietly dries up and dies. I should say that after Central America Egypt is meant for Cacti. I have collected a good many from old palace gardens, where they had probably been put by Ismail Pacha, who bought every plant he could. They have grown magnifi-

use of a solution of iodine or chloroform. The strength is 1 dr. to the gallon of the solution violet.

WAR ITEMS. We have received the following further particulars regarding the reported death of Rifleman JOHN DYVERS, referred to on p. 16. DYVERS, whose portrait we give on p. 40, was posted missing after a fierce engagement on October 9 at the farthest advanced position of the British Expeditionary Force in France, when the lines were extended and trenches captured from the enemy. In his early years, taught by his father, Mr. J. J. DYVERS, Richmond, deceased ramble in Ireland and Wales to study wild flowers, and in this way developed a love of plants that determined his choice of a vocation. He commenced his gardening career under Mr. W. W. PARRINEW (now of Manchester) in the Leath Park Gardens, Cardiff. In due course he proceeded to Belvoir Castle Gardens, under his uncle, Mr. W. H. DYVERS. Afterwards he entered the Royal Gardens, Kew, for the usual student's course. He was, on its termination, promoted to a deputy foremanship in the Alpine and Herbaceous de-

FIG. 15.—*CAMPANULA STANSFIELDII*. FLOWER FLOWERS VIOLET-PURPLE.

cently. Several Echinocacti have now, for two years running, been in blossom for four to five months, with three or more flowers open at a time; in some cases on plants so small that the whole plant—roots, spines, and all, would go into one of its own flowers. There are fine garden-here, but they are exclusively devoted to producing Roses and European annuals in winter. I want to get on to other plants, and my few Cacti, Stapelias, and Gasterias have encouraged me much. It used to be said here that no Roses, except La France and Gloire de Dijon, would grow in Egypt, but some bold adventurer imported others and found that they all grew and flowered splendidly. Again, the *Zinnia* grown here is a poor thing, so I got some of Sutton's and had plants a yard high and a yard and a half wide, covered with flowers, many of which were 1½ inches in circumference. Single plants of Indian Pink are 4 feet across.

IODINE FOR WOUNDS.—The practice of dressing cuts and other wounds with tincture of iodine, adopted in France for some years, has become popular in this country. One drawback is the rather sharp but evanescent smart which it causes. This may, however, be avoided by the

partment, under Mr. W. IRVING. Skilful at free-hand drawing from life, the original double-page illustrations of Saxifrage Groups in the Rock Gardeners' Library were the production of his pencil. At the declaration of war he was preparing to journey to Switzerland to study the growth of Alpine flowers in their native habitats. Quiet, unobtrusive, diligent, and of a kindly disposition, he was beloved by his countrymen, and by his guild and gardening friends.

Captain IAN BAXTER, B.Sc., R.W.F., only son of Mr. JAMES BAXTER, The Gardens, Benarth Hall, Coupar, has been awarded the Military Cross. Captain BAXTER enlisted in 1914, and shortly afterwards was given Commissioned rank. Subsequently, and before going to the Front in 1915, he acted as Instructor in Range-finding. He is a graduate of Bangor University, and before the war was carrying out Research in Forestry under a Government scheme.

* *Pharmaceut. Journal*, Jan. 6, 1917.

* "The Harvesting of Sphagnum Moss." *Tharm. Journ. and Pharmacist*, Dec. 25, 1916.

NOTICES OF BOOKS.

SWEET PEA ANNUAL.

This is perhaps the best *Annual* ever issued by the Society; which is saying a great deal for the energy of its editor, Mr. J. S. Brimton. Appropriately, the first two articles are tributes to the late Mr. N. N. Sherwood and Mr. Albee Bumper, who, from its commencement, have been earnest supporters of the National Sweet Pea Society. These articles, from the pens respectively of Mr. C. H. Curtis and Mr. Hugh Dickson, are illustrated by splendid portraits of the deceased gentlemen.

Mr. T. H. Dignall, M.A., writes a thoughtful and suggestive article on "The classification of Sweet Peas," but I am doubtful if his proposed system would be as popular as the one at present in use, which was devised by Mr. Walter P. Wright in 1900—the year of the bi-centenary celebration of the introduction of the Sweet Pea into England.

Mr. E. R. James' article on "Long Stems v. Quality and Refinement in Sweet Peas" appears very much to me, and I am in entire sympathy with it. If quality is sacrificed to size and grossness in anything a real loss is always made. Two writers from America, Mr. George Kerr and Mr. Frank G. Cuthbertson, tell us about the new race of early-flowering long-stemmed Spencer Sweet Peas. In the warmer States this new type when sown in October blossoms in the open from February to July, and cut flowers are on the market all the winter from plants grown under glass.

The veteran Edinburgh florist, Mr. Matthew Todd, writes on "What Scotsmen have done for the Sweet Pea." "Scotsmen in Exceelsis" would have been a fitting title for Mr. Todd's article. Mr. R. F. Felton writes charmingly on "The Decorative Value of Sweet Peas."

It would have added interest to the fine photographs of the different groups of judges at work if the names of the members had been added below each picture. *Wm. Cuthbertson.*

CULTURAL MEMORANDA.

VIOLETS.

Violet plants growing in frames should have all decayed leaves removed, the surface soil stirred between the plants, and the supply of water kept rather low at present. Any water that is necessary should be given early in the day, and extra air admitted afterwards, in order that the foliage may dry before night. Violets in pots may be given a slightly higher temperature in order to force the buds out. Stand them in a light position, and admit a moderate amount of air in favourable weather. Violets in pots are very acceptable for use in bowls in the dwelling-house.

THE PLANT STOVE.

The temperature of houses containing tropical plants may be kept low. A minimum temperature of 55° will suffice during very cold weather, provided the atmosphere is not overcharged with moisture. Any damping of the paths and stages should be done early in the afternoon; but very little damping is necessary in dull weather. In frosty weather lower the roof-blinds at night where fire-heat is used, to keep the temperature above the minimum. Let the plants have plenty of room, discarding any that are useless, rather than crowd the stages. Keep the roof-glass clean always. In winter, *Codiaeum* (crocodias), *Dioscoreas* and other stove foliage plants should not be afforded stimulants, and they should be watered with extra care; nothing should be done to cause the plants to make much growth at this season.

WINTER FLOWERING PELARGONIUMS.

Old plants of *Pelargonium* have passed out of *The Sweet Pea Annual*, Part 18. (Nat. Sweet Pea Society.)

flower, and if suitable young growths are available cuttings may be inserted. Shoots that have been exposed to the light are the best for the purpose, and they may be inserted around the sides of 4 inch pots filled with a compost consisting of loam, leaf-mould and sand. Water the soil, and place the pots on a shelf in the greenhouse.

LILY OF THE VALLEY.

RETAINED crowns of Lily-of-the-Valley are very scarce, but clumps may be dug from a well-established bed and placed on a hot-bed in a heated pit. Cover the roots with fine soil, and soak them with lukewarm water. Place some mats or litter over the glass until the flower-spikes are well through the soil. The plants may then be gradually nursed to the light. Successional clumps may be placed in heat at suitable intervals to maintain a constant supply of flowers.

FORMING SHRUBS.

SHRUBS of all kinds may be lifted from the reserve beds and potted in readiness for placing out to heat as required. They may be forced easily now after the recent frosts. Very large plants of *Lonicera* may be placed in boxes or tubs:

THE LATE RULERMAN JOHN DIVERS.
(See p. 39.)

they will be useful for supplying cut flowers. When the plants are introduced into heat syringe them with warm water two or three times daily.

THE MARKET FRUIT GARDEN.

APPLE FRUIT-BUD DEVELOPMENT.

FRUIT physiology is a subject studied more in the United States than in this country. A reminder of this fact is given in a record of some observations made on the subject named above by Mr. F. C. Bradford, apparently a member of the staff of the Oregon Agricultural College, and reprinted in the *Fruit Trades' Journal*. The Yellow Newtown Pippin appears to have been the subject of the author's observations. Under normal conditions, he says, this variety forms its fruit-buds on wood two or three years old, and, under favourable conditions, a bud produced in the axil of a leaf on wood of the current year will produce next year a short spur with wintered leaves, and in the following year this spur will bear fruit. Normally, it is added, the spur, having borne fruit, will again form a fruit-bud during the succeeding year, which may be expected to bear fruit a year later. But these apparently normal conditions are often varied. For example, a spur may bear fruit two years in succession, and terminal, or sometimes axillary buds, produced in one year may bear fruit in the following season. A particularly interesting observation is one bearing upon the alternate-year fruiting of many varieties of Apples, particularly those which usually fruit profusely when they bear at all. It was noticed

that in a very small crop year the spurs which were bearing were as likely to form fruit-buds for the next year or those not bearing, while when a tree is bearing a full crop very few of even the barren spurs will develop fruit-buds sufficiently for fruiting in the following season. It is satisfactory to have this confirmation of my own theory of the cause of alternate-year fruiting, derived from the labelling of trees of the Allington Pippin in three successive seasons. It was found that trees which bore great crops in one year had none in the next season, while those which bore moderate crops had more or less fruit, and those which bore no Apples had great crops in the next year. Fruiting on terminal buds of one-year-old wood appears to be more common on American varieties than on those grown in this country. It was so general in the Oregon College orchards in 1914 that it was observed on all but one or two varieties. But it is more common on young than on old trees. On the latter, indeed, it was found that numerous fruit-buds on terminals of one-year-old wood were developed only when a tree formed such buds in great abundance. When the number of fruit-buds was small there were practically none on the one-year-old wood.

APPLE CHELMSFORD WONDER.

This variety is never named in market quotations, and therefore it may be supposed to be not commonly grown for market. It is not named in Hogg's *Fruit Manual*, and possibly it may be a comparatively new variety. [Apple Chelmsford Wonder was raised from seed by the son of a mechanic at about 1870 in a cottage garden in the neighbourhood of Chelmsford, but nothing is known of its parentage. It was not introduced to commerce till about 1890, and it received a First-Class Certificate from the R.H.S. Fruit Committee on November 10, 1891, when exhibited by Messrs. Salmarsch and Sons. It is a good late Apple, and has an excellent flavour when cooked.—E.S.] It was supplied to me by Messrs. Cheal as one of the Apples grown in short rows for trial. The trees proved vigorous growers, and since they reached fruiting age they have borne moderate crops annually. The fruit is large and of a delicate yellow colour, with light pink slightly striped on the sunny side. One particular feature of this Apple is the extreme thinness of its skin. This renders it subject to insect punctures, the results of which are now apparent in numerous very small and slightly sunken spots, which lower its market value. The spots have developed almost, if not quite, entirely since the fruit has been stored in the fruit chamber. Chelmsford Wonder is one of the best of cookers, and, as its core is small and its skin extremely thin, it is an economical Apple to use, except that its acidity calls for a full supply of sugar. For baking whole after coring it is almost unequalled for softness and juiciness. When sound it keeps as long as Bramley's Seedling or Newton Wonder.

SPOTTED APPLES.

The disfigurement of Apples by numerous small spots is not to be confused with the results of Apple fruit spot (*Xanthosporium pomii*), which resembles bitter pit, and is commonly confused with it. The spotting now referred to is not yet recognised as a distinct disease. Last winter the small spots developed on several varieties while the fruit was in store, and possibly the same results would have appeared this winter if these varieties had been kept as long as usual.

All but some Chelmsford Wonders and Newton Wonders, however, were sold by the end of November, as prices were tempting. Efforts made in various directions last winter to ascertain the cause of the spotting were not successful. The most that was conjectured was that some kind of "semi-parasite," such as *Cladosporium*, attacked punctures made by insects. But no one seems to know what insect makes numerous punctures invisible to the naked eye upon the fruit while it is on the trees (as no insects that

could make them as found on the Apples in stock. Last winter 170 spots were counted on one Apple, and 50 to 100 were quite common.

AMERICAN APPLE EXPORTS.

Considering how largely we import Apples from the United States, it is surprising to see, from a report by the American Department of Agriculture, that exports to all countries, including dried Apples estimated as green, even before the war reduced them, were only about 5 to 6 per cent. of the total crops. The estimated crops of 1901-5 averaged 69,691,090 barrels, of which the average exports were: 5.1 per cent. The corresponding figures for 1906-10 were 51,532,000 and 5.4. Later crops and exports were as follows: 1911, crop 71,340,000 barrels, exports 5.9 per cent.; 1912, crop 78,407,000 barrels, exports 5.5 per cent.; 1913, crop 48,470,000 barrels, exports 6.7 per cent.; 1914, crop 84,400,000 barrels, exports 5.4 per cent.; 1915, crop 76,670,000 barrels, exports 5.9 per cent.; 1916, crop 67,695,000 barrels, exports not yet known. It will be seen that the war reduced the exports considerably in 1915. *Southden Grower.*

HOME CORRESPONDENCE.

OLD SEED AND PLANT CATALOGUES.—As stated by your correspondent, W. H. C., Hampton, there are no catalogues now published such as the firm of Rollison used to issue. Neither are such collections of plants brought together as used to be cultivated at Tooting, the present day tendency being to specialise rather than give collections which in the number of kinds represented could compare with many botanic gardens. A catalogue now before me of William Rollison and Sons, Tooting, for the spring of 1917, must have been among the last issued. It consists of 238 closely-printed pages, and contains all classes of plants, of which, by the way, a much higher price is charged for many than that which prevails at the present time. It is noteworthy for the long lists of Camellias, Indian Azaleas, greenhouse Hoeths and various other hard wood plants, which are now so seldom seen. A full page is devoted to Rollison's Telegraph Catalogue, referred to by your correspondent, W. T.

I am glad to see that there is someone still left who knew the old firm of William Rollison, and the catalogues they used to issue in those days second to none. Was the secretary of old gardener who raised the Rollison Telegraph Catalogue? In imagination I can see the old man now coming from his straggling garden situated in the High Street. At that time the firm was in a flourishing condition; my father was head packer, and he a boy in the Springfield and Home Nurseries. Until recently I had in my possession a copy of their latest catalogue. I do not remember W. H. C., but he may recollect my name. *William Gardner, Barkingside House, near East Grinstead, Sussex.*

VACANT LAND IN MUNICIPAL AREAS. Some vacant land is getting operated upon in this district, and much more will be brought into use as the season advances. The work is being done by any individual who chooses to say that he wants a plot and will work it. I do not believe this is the best way to go to work, and have said so locally, from the first. All spare, suitable suburban lands should have been taken over and cultivated by each respective borough or urban council definitely for the nation. (This idea is also fully embodied in the leading article in the *Gardener's Chronicle* of December 25). The work of preparing the land would be more quickly and much more easily done by municipal authorities getting a plough to break up the ground after first having it closely mown with a scythe, than the method which seems to obtain here of each person getting to work as he best can. At harvest time it will be a case of each cultivator getting the highest prices he can, and rightly so, for his labour; whereas, in the hands of a council, it would be to no one's gain to hold up or push any given commodity. With the exception of buying a plough (which perhaps

could be borrowed), and the necessary seeds, there would not be any further expense, for I believe, around here at any rate, employers would gladly have given their gardeners' services on stated days which, together with the council's labour, also loaned, could have been arranged to cover the whole operations in a manner equitable and satisfying to all. *C. J. Higgate.*

GARRYA ELLIPTICA (see p. 19). A specimen growing in a garden in Central Porthshire, planted some eighteen years ago, has at present a height of about 12 feet. It is certainly sheltered from the north, but since being planted it has been at least three times exposed to a temperature below zero. It regularly produces a crop of catkins. *J. Gilbert, Lelock Park Nursery, Cornwall.*

SEED GROWING.—It is obvious that without a sufficient quantity of seed the breaking up of fresh land or the cultivation of vacant spaces can only result in great waste, both of the labour so urgently needed on all sides and also of capital. The actual situation at the present time in regard to seed supplies is clearly stated in the introduction to my firm's *Grower's Guide for 1917*, in the following terms:—

ing of seed crops be ensured when all other crops involved less labour. There is little doubt that before spring has far advanced the available stocks in this country of many kinds of vegetable seeds must prove insufficient for the needs of the community.

The following are some typical examples of the increases in wholesale values of seeds, as compared with those in a normal year, and even at these prices further supplies, in some instances, are unobtainable:—

Seed	Per cent.	Seed	Per cent.
Broad Beans	300	Runner Beans	300
Spinach	300	Onions	300
Garden Carrots	300	Garden Peas	100
Garden Turnips	50	Swedes	75

Field Turnips, 120 to 150 per cent.

The two main contributing causes to this unprecedented rise in values are, of course, the high prices obtained for cereals and the scarcity of labour. And if the present scarcity and the abnormal values now ruling are not to become far more serious next season, there is but one possible remedy—viz., to reinstate on seed-growing farms all the trained and expert labour which has been removed by tribunals. In the great majority of cases farmers who are seed-growers allowed all their men who could be

FIG. 16. APPLE CHALMERSFORD WONDER (See p. 40.)

SEED SUPPLIES AND THE WAR. Our customers will not be surprised that the war, in which nearly the whole world is engaged, has affected the supplies of seeds in common with other necessaries of life. The scarcity of farm labour in itself has materially reduced the acreage under seed cultivation, and this will be readily understood in view of the high prices prevailing for cereal crops, which require much less labour than seeds. A further important factor is that, during the long years of European peace, seed growers have been able to place their crops wherever in the countries of our Allies the soil and climate produced the best supplies with the highest germinating power. But with the progress of the war these sources of supply are necessarily curtailed—partly through difficulties of transit, partly through regulations prohibiting the export of seeds, and, partly again, through the shortage of labour which everywhere exists. These seed houses which were in a position to forecast the probable course of events naturally extended their cultures at home. While we ourselves have thus been able to make abundant provision for the requirements of our customers, this was only possible by increased capital expenditure, for by no other means could the plant

spared to volunteer under the Derby scheme, retaining only those whose expert and technical knowledge rendered them indispensable. When the tribunals began work they considered it their duty still further to deplete the labour on seed farms, with the result that the acreage under seeds for harvest 1917 and 1918 (now contracted for) is very much less than in 1916. Foreseeing the difficulties with which seed growers are now faced, I had the privilege early last year of introducing to the Committee dealing with Reserved Occupations a deputation of leading houses in the seed trade, amongst whom were represented Messrs. Carter, Messrs. Webb, Messrs. Dobbie, Messrs. Garton, Messrs. Barr, etc., and Messrs. Hurst, the leading wholesale seed merchants. The Committee only needed to have the facts placed before them to realise the immediate necessity of including seed growing and distributing amongst the reserved occupations. In doing this the Committee were greatly influenced by the fact that not only is it imperative to maintain the supply of seeds for raising vegetable crops at home, and the roots and herbs and green crops upon which our flocks and herds are fattened, but also the supply of seeds for exporting to the Colonies and Dominions, which

depend entirely on seeds shipped from England for raising the vast supplies of mutton etc. annually imported into this country. The present difficulty should have been, in a great measure, obviated if tribunals had granted the exemptions they were authorised to grant to seed-growing experts, but unfortunately this has rarely been the case in any sufficient degree. Such gossians have been made that the State should start seed farms, but seed cannot be grown without technical knowledge, and, as already stated, there are insufficient men now left on the existing seed farms. The situation is undoubtedly grave, but with due support from the existing authorities seed growers may be trusted to make the utmost use, not only of their knowledge and experience, but of every means at their disposal for economising labour. As an instance of such economy of male labour, I may mention that a crop of Mangold seed, considered to be the finest in the county of Lincoln, was last year entirely planted and harvested by women, under the grower's supervision. May I add a word on the supply of seed Potatoes? "Seed Potatoes" may be classed under two general headings—(a) The smaller tubers, screened out of the general crops, which are often used for planting on farms, or, failing such a demand, given to the pigs or sold to the bakers. (b) "Seed Potatoes," which are grown by seed merchants, either personally or under contract, and which are raised exclusively from selected pedigree stocks. In the latter case the entire crop, after imperfect, immature, or diseased tubers are removed by hand picking, is used for "seed"—only those too large for planting being otherwise disposed of. The cost of producing seed Potatoes grown from pedigree stocks is out of all proportion to that of ordinary field crops. Every plant has to be examined during growth for trueness to type, &c., and untrue plants removed by hand, and this involves frequent inspection of crops in various stages of growth. The same land cannot be used in successive years, as is sometimes the case for market crops (as in Avshire), otherwise self-seed tubers appear in the crop. The produce cannot be marketed when lifted, but must be stored at great expense until the spring, and stored in such a manner as to ensure a free growth immediately the tubers are planted. If, therefore, the price a grower of seed Potatoes may ask for the crop of 1917 is limited to £5 15s. per ton, as now proposed, the production must be reduced to such an extent as to jeopardise the supply for planting in 1918—if not to destroy all hopes of any adequate supply. No maximum price less than £8 per ton can possibly meet the situation. The seed Potatoes grown from pedigree stocks during 1916 have involved an outlay, on an average, about 50 per cent. above £3. Arthur W. Sutton, Reading.

to ensure are the wishes of the supporters of the Institution. At the commencement of the year there were 265 inmates, viz., 152 men and 113 widows, receiving an annual amount of £4,248. To-day the Committee propose to the subscribers to add by election 17 applicants from an approved list of 61 candidates. They very deeply regret that they are unable to advise a greater number, especially as some of these candidates have been asking for the Institution's help for some years past, but with an income diminishing on account of the sad times through which we are passing, and not knowing what the immediate future may bring they feel it is desirable to be very cautious in the administration of the funds. But whilst they are sure that so many deserving cases should have to wait another year at least before they can receive the longed-for annuity, the Committee are very thankful to have the means of assisting many of the very necessitous cases through the two charitable special funds, viz., "The Victorian Era" and the "Good Samaritan," the income from which is devoted in the one case to assisting these unfortunates and candidates who had formerly been contributors to the funds of the Institution, and in the other case to temporarily helping deserving applicants in distress through illness or some other misfortune. The interest only derived from invested funds is available for these two purposes. The Committee also desire to express their indebtedness to those individuals, ladies, and gentlemen who have so kindly allowed their gardens to be opened to the public for the benefit of the cause, viz., The Right Hon. Earl Beauchamp, The Right Hon. Lord Northbourne, The Lady Balfour, Sir Frank Cross Bart., J.P., LL.B., Roger J. Corbet, Esq., and C. W. Dixon Permas, Esq. The Committee also desire to place on record the kindness of their Treasurer, Arthur W. Sutton, Esq., J.P., F.R.S., V.M.H., and George Moore, Esq., V.M.H., for generously giving a year's allowance to three of the unsuccessful candidates who were most grateful for the help afforded them. They also tender their best thanks to the Hon. Solicitor, W. A. Biles, Esq., J.P. the Hon. Auditor, Messrs. George H. Colley and Co., Thomas Manning, Esq., and Part J. Moore, Esq., the Horticultural Press, the George Moore Concert Committee, and to other friends for their valuable services to the Institution. The several Auxiliaries have again proved valuable adherents to the work, especially during the past year, and grateful thanks are given to the following honorary officers for their much appreciated services.

SOCIETIES.

GARDENERS' ROYAL BENEVOLENT INSTITUTION. ANNUAL MEETING AND ELECTION OF PENSIONERS.

JANUARY 25.—The seventy-seventh annual general meeting of the Gardeners' Royal Benevolent Institution took place on Tuesday last at Simpson's Restaurant, Strand. Sir Harry J. Veitch, chairman and treasurer, presided over a moderate attendance. The report of the executive committee for 1916, and the statement of accounts for the year, were read by the secretary, Mr. G. J. Ingram, as follows:

THE REPORT OF EXECUTIVE COMMITTEE. The Committee, in presenting their 7th Annual Report and Audit Statement of Accounts, are very pleased to be able to state that, notwithstanding the many difficulties arising out of the terrible war in which our country is engaged, the good work and benefits of the Institution have been well maintained during the past year. Never has there been a more anxious time, accentuated by the loss of many valued and liberal subscribers, also by the inability to hold the usual Festival Dinner, one of the main sources of adding to the income of the Charity in meeting its liabilities, and which has materially assisted the funds. Nevertheless, the Committee have done their utmost to carry out what they

The losses of valued friends and supporters by death have been unusually heavy during the year. Foremost amongst them must be mentioned N. X. Sherwood, Esq., J.P., V.M.H., for many years one of the Trustees of the Institution, and for over fifty years a most generous contributor to its funds, and whose passing away is a most grievous loss; also W. Y. Baker, Esq., Vice-Chairman of the Committee, and for many years a constant attendant at all its meetings, and who was ever ready to give it liberal financial support. Another death was that of G. Wythes, Esq., V.M.H., who was for many years a member of the Committee, and still another was that of Robert Tait, Esq., of Manchester, who for nearly forty years had been a regular contributor to the funds. The Committee very gratefully acknowledge legacies from each of these gentlemen. Amongst other losses may be mentioned A. Thompson, Esq., of Milton Grange, Soudon; Henry J. Jones, Esq., of Bevington; Mrs. Wheeler Lea, of Worcester, &c., &c. In conclusion, whilst deeply thankful for the generous support accorded to the Institution during the past year under the trying circumstances which have been met, and most of all the Committee venture to express their most earnest hope that the next Annual Meeting of the Charity may be held under much more happy conditions, and that, in the meantime, every friend will do his utmost to continue to support its funds, and also to induce others to do so, remembering how many old and

Reserving applicants are looking to the Institution for that invaluable help which will be such a boon to them during their remaining years.

HARRY J. VEITCH,
Treasurer and Chairman of Committee.
GEORGE J. INGRAM,
Secretary.

The adoption of the foregoing report and balance-sheet were moved by Sir Harry Veitch, who said that they met that afternoon with mixed feelings, and in circumstances differing from those of recent occasions. The losses the institution had sustained during the year were very much more serious than usual. The late Mr. N. N. Sherwood, one of their trustees, had been a great personal friend of his for many years. He was glad to say that Mr. Sherwood's son, Mr. Edward Sherwood, was following in his father's footsteps, and gave promise of doing a great deal of good; they welcomed with enthusiasm the work he had already begun; but no one could ever quite fill the place rendered vacant by the loss of Mr. N. N. Sherwood. Then there was Mr. Baker, a man who was always sympathetic, always desirous of helping the work of the Institution to the utmost of his power. He was their vice-chairman, and always attended the committee meetings when he (Sir Harry) was unable to be present. There were others whose death would affect the prosperity of the Institution, but he mentioned those two as being amongst their most intimate colleagues.

The present unfortunate circumstances were having an influence on the funds. He did not wish the meeting to understand that the financial position was anything but sound; it was perfectly sound—but at the same time, they had to face the fact that the Institution had to reckon with a diminishing income, and it was just as well to look the situation fairly in the face. It might be said that the laid first-class investments, which was no doubt the case; but with the present depreciation of capital the committee earnestly hoped that it would not become necessary to realise any portion of the investments. Three matters showed that the committee had had to manage the Institution during a very anxious time. In the circumstances, therefore, they were most thankful to those who had thrown open their gardens to the public and had given to the Institution part of the whole of the proceeds obtained in this way. For instance, that very afternoon they had received from Sir Frank Crisp a cheque for over £90. Then, the local auxiliaries were continuing their efforts with unabated zeal, though not, of course, a way with the same success as had previously attended their efforts. From Worcester, for instance, a delegate had paid to-day a cheque for £100, and he believed that during the afternoon a delegate from the Reading branch was expected to bring a cheque of equal or larger amount. Referring appreciatively to the excellent services rendered by the secretary, Sir Harry Veitch remarked that for months Mr. Ingram had been without an assistant, and had in very trying circumstances done the work himself, in his usual efficient manner.

The motion for adoption was seconded by Mr. Howard, and carried unanimously. Proceeding to the election of officers, Mr. A. W. Sutton proposed the re-election of Sir Harry J. Veitch as Treasurer. He said that year after year they tried to express their thanks to him for the great services he rendered to the Institution, but words failed adequately to convey what they really felt. For himself he could say that he never realised the value of those services more highly than at the present time, with the severe losses already referred to in his mind. He thought that the best way to express their thanks to Sir Harry Veitch would be to redouble their efforts to add to the resources of the Institution. The motion was seconded by Mr. Geo. Munro and carried with acclamation. In response, Sir Harry Veitch said that as long as his health and strength permitted him to do the work, and the members continued their confidence in him, he would have the greatest satisfaction in continuing in his present position.

Mr. Geo. Munro proposed the re-election of Mr. G. J. Ingram as Secretary; this was

seconded by Mr. D. Ingamells, and carried unanimously. The re-election of the retiring members of the Committee, with two additional members, Mr. H. G. Alexander and Mr. J. K. Kinnell, was moved by Mr. J. McKechar, and carried unanimously. On the motion of Mr. W. A. Blaney, Mr. Edward Sherwood was elected a Trustee in place of his father, now deceased. The auditors and arbitrators were re-elected, and the meeting then proceeded to appoint scrutineers for the ballot, Messrs. J. McKechar, Edward White, and H. G. Cox being appointed for this purpose. There were sixty-four candidates, and the Committee recommended the election of eighteen of these.

RESULT OF ELECTION.

Name	Age	No. of Votes
Albrey, George	80	5,845
Farquhar, Jane G.	69	4,419
Vallance, Abram	60	4,369
Cassleton, George J.	62	4,302

Stoward, Emily A.	64	3,457
Lockyer, John	66	3,244
Jinks, Eliza	67	3,241
Hinton, George	63	3,235
Opton, Elizabeth	65	3,122

The Scrutineers reported that twenty-four voting papers were spoiled, accounting for 195 votes. It was also reported that the candidates Charles Burden, and Charles Morgan had died since the list of candidates was drawn up. Following the declaration of the poll, Mr. Geo. Munro moved that the candidate George Wilson be elected a pensioner by resolution, on owing to the special circumstances surrounding his case. This was seconded by Mr. James Hudson, and carried. Mr. Munro further said that the candidate Albert Harding was in very hard case, and offered a sum of £10 for the benefit of this candidate, promising at the same time to do all he could to get him elected at the next meeting. It was also announced that Mr. Arthur W. Sutton desired to give a sum of £20 in order to place upon the fund the candidate Edwin Fough. This completed the business of elections. A vote of thanks to the Scrutineers closed the proceedings.

ROYAL SCOTTISH ARBORICULTURAL.

As the Court of Session recently an action was raised by Mr. Charles S. France, Aberdeen, to have a resolution altering the law relating to the number and election of the office bearers, which was passed at the annual business meeting of this society on February 6, 1915, reduced on the ground that it was not passed in accordance with the laws of the society. The pursuer's contention was that the motion for alteration of the law was not carried by a two-thirds majority, which is necessary for the alteration of a fundamental law, and that therefore the pretended resolution was null and void. A proof of the averments was allowed, and the Lord Ordinary (Hunter) has found that the resolution was passed by the necessary two-thirds majority, and has assigned the defenders with expenses.

ROYAL CALEDONIAN HORTICULTURAL.

JANUARY 10.—The annual general meeting of this society was held in Dowell's Rooms, George Street, Edinburgh, on this date. Mr. J. D. Adair, senior vice-president, occupied the chair, and, including the council, there was an attendance of 25 members.

The statement of the accounts showed that the income for the year exceeded the expenditure by £56 *vs.* 9d., and that the funds were £682 14s. 5d., an increase of £17 5s. 9d. over the previous year. Mr. W. H. Massie pointed

out that as the railway stocks held by the society had not been valued, the capital was over-stated by over £170, and he thought that before incurring so much expense as they had done in connection with the show which it was proposed to hold last September, the council should have taken steps to ascertain whether it was possible to carry it through or not. The accounts were afterwards adopted.

The following office-bearers were elected for 1917: President, Lord Elphinstone; vice-president, Mr. Henry Methven; councillors, Messrs. Robert Fife (Messrs. Dobbie and Co.), Edinburgh; and John Hightgate, Hopetoun, South Queensferry.

CROP AND STOCK ON THE HOME FARM.

IS the hope of aiding the movement for increasing the food supply, the Editors have asked me to contribute hints on reasonable matters pertaining to farm crops and stocks. There are many head gardeners who are responsible for land and small farms, as well as the garden, and some of the less experienced may be glad of a few hints from one who has had many years' experience. My remarks on the various subjects will be based on my own practice. It is not necessary to tell a practical person that the ploughing up of grass land will not produce a huge crop of Potatoes the first year. But to those with little experience, let me say, do not imagine such a result possible unless actual trenching of the soil is carried out. Grass land properly prepared for another crop this season would produce a full Potato crop in 1918. For the proper utilisation of such a plot note what I say in a subsequent paragraph on Oats.

For this season's Potato crop lose no time in getting the farmyard manure on to the land, at the rate of 15 to 20 tons per acre, deeply ploughing it in. Stiff soils must have the manure in winter, but in the case of soils of a lighter character the manure may be applied at planting time if more convenient.

The seed tubers should be occasionally examined to make sure that they are not prematurely "sprouting." If they show signs of undue growth a vigorous turn over with the Potato fork will bruise any shoots and thus check growth. The quantity of seed required per acre is approximately 15 cwt., regulated, of course, by the size of the tubers. Where farmyard manure is not available in quantity, artificial stimulants will be required to aid growth. I would strongly advise that such manures as basic slag, superphosphates and sulphate of ammonia, be obtained as early as possible, as there appears already to be some difficulty in getting such things through. A clean Oat or Wheat stubble is good land for Potatoes, assuming it was deeply ploughed in the autumn.

WHEAT.—The daily press is advocating strongly the sowing of spring Wheat, especially on broken-up pasture. I am little in favour of spring sown Wheat; the chance of obtaining a reasonable crop is too small. Much better have a full crop of Oats from the same plot. Land from which sheep fed Rape, Cabbage or Turnips was taken, might produce a fair crop of the white nursery variety. My experience of Wheat sown on February 22 last year as an experiment does not encourage me to repeat the experiment, as it was a miserable failure. My experience of varieties recommended, like Little Loss or Marvel, is that the corn produced lacks "strength," known as glutin, which is essential to the miller. A strong sample of Wheat should be opaque, with a dark skin, not light in colour as in the case of a "weak" sample. "Strong" Wheat should weigh from 65 lbs. to 66 lbs. per bushel.

OATS.—When people agitate for the ploughing up of grass land and sowing thereon Oats, they are acting wisely as far as this crop is

concerned. This method of dealing, with woad-out Suffolk leys is common and on all farms with the ploughing up of pasture. Wireworm is apt to be troublesome to the first crop, but with judicious management this pest can be kept under. At times heavy fields of Oats are obtained from such a preparation. From 48 to 60 bushels per acre may reasonably be expected.

Plough the land at once, and not more than 5 inches deep, carefully adjust the skim roller on the plough to ensure the grass being thoroughly buried. The presser should follow in each furrow to consolidate the whole, thus ensuring the rotting of the turf quicker and making travelling less easy for the wireworm. If the ploughing be done at once a good surface tilth will be obtained by sowing time—March 1. Four bushels of seed per acre is the common quantity allowed; some sow more, others less. In some counties black Oats only are grown, the Tartarian variety being generally preferred; in other districts white Oats of the Abundance type are largely grown.

MANGOLDS—This is one of the most important of root crops grown, especially for dairy cows in butter production. Horses, sheep, pigs and poultry all appreciate the roots. The amount of crop obtained per acre varies considerably, owing to soil and methods of culture; a reasonable yield is 30 tons per acre. For cows in milk the Tankard section is preferred, as containing more sugar. Globe varieties produce a heavier bulk, and are valuable for sheep, pigs and poultry. The quantity of seed per acre is 3 lbs. Mangolds can be grown quite well by the aid of artificial manure only. Therefore, those with no animal manure available need not despair, though with a combination of the two greater success is assured. Spread from 15 to 20 tons of farmyard manure per acre, if available, on the plot selected, which may have carried Wheat, Oats or Barley as the previous crop, and was ploughed deeply in the autumn. Plough in the manure at once; this will allow time to obtain a good surface tilth by April, which is a good time to sow the seed.

CABBAGE—Varieties of the Drumhead type will produce a large quantity of valuable food from an acre of land well managed, ready for the use of cows early in October, as the grass in the pastures is getting scarce. Sheep fatten on Cabbage alone in the early autumn. For breeding sows and poultry, too, Cabbage is an economical food. Half a pound of seed will be sufficient for an acre, raising the plants in a bed and transplanting them afterwards. Heavily manured and deeply ploughed stiff land is ideal for this crop. The surface should be left as rough as possible to be pulverised by the weather.

POULTRY—At the present time poultry is one of the most valuable assets to a farm, no matter how small; but, unfortunately, in the past poultry has been sadly neglected by the farmer, until the present scarcity of eggs has forced upon all classes the need of greater effort in maintaining a better home supply. Among the fifty breeds of fowls there is naturally a difference of opinion as to which is the best. Too many persons wish to combine egg and table fowls in one breed. This is not possible if perfection in egg production and table fowl is the aim. For all-round hardy utility fowls, Rhode Island Red, Light Sussex, Buff and White Orpington are to be recommended. For egg production only, White and Black Leghorn are excellent. For table chickens, Silver or Dark Dorking, crossed with Indian game, are unexcelled. As a combination, Plymouth Rock, Buff and Black Orpington, crossed with Indian or English game, are good.

No time should be lost in mating the birds for this season's supply. Six hens of 1915 hatching mated with a cockerel of last season's hatch, or six pullets mated with a bird of 1915, should produce good results. *E. Robinson, Swanmore Park, Bishop's Cleeve, Waltham.*

LAW NOTE.

DELAY IN TRANSIT.

At the Huntington County Court on Friday, before His Honour Judge Wheeler, K.C., the Great Northern Railway Company sued H. Papworth, farmer, Ramsey, for 18s. 10d., carriage of manure, and defendant brought a counter-claim of 24 1/2s. for loss on sale of a quantity of Celery. Mr. R. G. Deacon, from the solicitor's department, King's Cross, appeared for the company, and Mr. Sergeant, of Ramsey, for the defendant.

The claim for carriage was admitted, and on the counter-claim Mr. Sergeant said in November, 1914, his client consigned from Ramsey St. Mary Station to a firm of salesmen at St. Pancras Potato Market 500 rolls of Celery for sale on commission. The Celery arrived on November 30, hot and in bad condition. Some 270 rolls were sold for 8s. per dozen and 30 for 4s. per dozen, the market price that day for Celery in good condition being 12s. per dozen rolls. Defendant claimed 4s. per dozen on 270 rolls, less 9s. commission. In the ordinary course of transit the Celery should have reached the market the day after it was loaded up, but in this instance the Celery was five days in transit. A claim was originally sent in for 23 15s. 2d. in December, and defendant heard nothing from the company until April, 1915, when they wrote that the delay in the transit was due to the exceptionally congested state of the railways at the time, consequent on the war. No doubt the war had something to do with the delay at the time, but the question was whether the delay in this case was due to neglect.

His Honour said they had all had to suffer inconvenience by reason of the war.

Mr. Sergeant said the company had to prove that this particular traffic was delayed by the war.

His Honour: I am bound to assume there is a war going on. The next question is: Was this delay caused by the war?

Mr. Deacon, for the company, admitted there was delay, but thought he could shorten the case on another point. On the consignment note signed by Mr. Papworth, Clause 3 read: "No claim in respect of goods for loss or damage during the transit for which the company may be liable will be allowed unless the same be made in writing within three days after delivery of the goods." In this case the company heard nothing about the claim until December 8, although the goods were delivered on November 30, so that the company had no opportunity of inspecting.

Mr. Sergeant said the claim was made at the earliest date, as his client did not hear of the delay until December 2.

His Honour pointed out that defendant's agent, to whom the goods were consigned, was equally bound by the conditions laid down by the company. Mr. Sergeant said if his Honour held that the condition applied in this case, there was still the point as to whether the delay had been reasonable.

Mr. Deacon said he was prepared, if necessary, to fight the case on the question that the delay was due to the war.

His Honour: We all know that the war has caused delay on the railways. Even in my own small way I have been delayed hours and hours. Mr. Sergeant: I am afraid we all have.

His Honour thought defendant must be bound by the condition stated. This condition was purposely inserted for the protection of the company. He had a lot to do with cases dealing with railway conditions in his younger days, and had tried over and over again to get beyond them, but always failed to do so. He gave a verdict for the railway company on the claim and counter-claim.

Spello Hill, where the late Mr. Stobart had an excellent collection of Orchids, the *Odontoglossum* being a great feature. A brusque, outspoken Yorkshireman, Mr. Hartley was highly respected by all who knew him, even by those who perchance did not agree with his views, always fearlessly expressed. He was a well-known figure at the London R.H.S. Shows. He was laid to rest on New Year's Day in the little churchyard at Copgrove, close to the scenes of his many activities, amid many manifestations of esteem and respect. T. 1.

ANSWERS TO CORRESPONDENTS.

There are few gardeners, and still fewer amateurs, who do not on occasion require immediate information upon various points of practice. But either from an unwillingness to inquire, or from not knowing of whom to make the inquiry, they too often fail to obtain the information they are in want of. And let no one be alarmed lest his questions should appear trifling, or those of a person ignorant of that which he ought to know. He is the wisest man who is conscious of his ignorance; for how little do the wisest really know—except that they know little. If one man is unacquainted with a fact, however common, it is probable that hundreds of others in the same position as himself are equally unacquainted with it. To ask a question, then, is to consult the good of others as well as of one's self.—*Gardener's Chronicle*, Vol. 1, Vol. 1, January, 1917.

HURRY CYTRIFERUMS: *Dorset Gardener*. Some of the North American species, like *C. aculea* and *C. montanum*, may be grown in soil which is quite free from lime if given the requisite conditions of shade and suitable soil. For these two a soil rich in humus overlying heavier, well-drained loam is necessary. *C. spectabile* may be grown in heavy loam, and sometimes does well on a bank amongst low shrubs in full sun, where the soil is very retentive, though no stagnant moisture is found anywhere near the plant. This position has been tried with success after failure in a peat bog. The Siberian *C. maranthum*, and our native *C. calcidius*, with the intermediate *C. ventricosum*, are easy to grow if a prepared bed of heavy loam is available. If *Dorset Gardener* could get some clay and mix it with his sandy loam he would have a suitable compost for these plants. Plenty of lime rubble in the way of drainage is also necessary, and a half-shady position is best amongst low growing shrubs.

ONIONS: *G. B.* In an ordinary way it is not necessary to bend the neck of an Onion over in order to get it to mature satisfactorily, nor is it advisable to make the practice a general one; at the same time it is found that in cases where particular plants develop thick necks and show a disposition to continue growth the purpose of the grower, which is the ripening of the bulb, is accelerated by imposing the check referred to in your note.

PURCHASE OF POTATO TUBERS: *P. de H. B.* We cannot be responsible for advising you where it is possible to obtain perfectly healthy seed-tubers, though there is no doubt that they are (or were) to be purchased. There are certain varieties that so far have proved immune from the black scab disease, but we judge from your letter, which is scarcely so definite as could be wished, that your loss last season was caused by the older disease, *Phytophthora infestans*. Read the hints on Potatoes printed on pp. 34 and 36.

THERMOMETER: *A. W.* The easiest way of testing your thermometer is to compare its readings with another instrument that is known to be correct. If you have not a recently tested thermometer take the one you consider doubtful to a manufacturer or dealer in scientific instruments, and he will doubtless test it for you for a small fee.

MARKETS.

COVENT GARDEN, January 27.

We cannot accept any responsibility for the subsequent reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quantity of the sample, the season in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—*ENS.*

Remarks: The cut flower department has still an empty appearance. Chrysanthemums are practically finished, and this fact has forced the prices for other white flowers, conditions which promise to obtain for a few weeks to come. A few boxes of bulb-balls are received from Llandudno. There is a further increase of these flowers and yellow Narcissus from Guernsey, so that a drop in their prices is expected daily. The odd variety has caused a shortage in the supply of Carnations and Liliums. A few white and coloured Tulips are sold at high prices. The supply of Lily of the Valley is sufficient for the demand. The quality is fairly good, but red boxes of bulb-balls from the new season crop are being sold at from 10s. to 12s. per dozen boxes. Small consignments of French flowers are received daily, they are mostly white Carnations, Mimosa and Violets. There have been no Arran Narcissus or Campanulid, so far as is known from France this season.

Remarks: There are only limited supplies of both English and Colonial Apples. Pears from California are a good supply, the varieties consisting of Winter King, Pomona, die Concord, Glen Moreau and Easter Beauty. Blackberries are fairly plentiful, but several varieties are almost finished. A consignment of fruit from the Cape is due to reach the market the shipment consisting of Nectarines, Peaches, Pears, Plums and Apricots, besides oranges and an odd lot. There has been a better supply of French salads during the past week. Fanned vegetables are scarce, and if odd wealth continues there will be a shortage in all vegetables and fruit not shown. Some of the prices to reach the market from Toronto: E. B. R. Coed Garden Market, January 27, 1917.

— Arran Chief	11 6 12 1	— Queen	11 0 11 6

Remarks: There are moderate supplies and a fair demand. Stock in London are not very large. Prices are about the same as those of last week. Edward J. Bennett, Covent Garden and St. Pancras, January 27, 1917.

DEBATING SOCIETIES.

ELSTREE AND BOREHAM WOOD HORTICULTURAL CLUB.—At the meeting of the Elstree and Boreham Wood Horticultural Society, held at the Parish Hall, Letchmore Heath, on the 18th inst., Mr. Edwin Beckett gave an address on "Increased Vegetable Culture." Mr. C. P. Ayis, J.P., occupied the chair. Despite bad weather the hall was crowded. Slides were shown dealing with vegetable cultivation, including several recently taken of ploughing at Aldenham Park, where about 30 acres of rough pasture-land is being broken up specially for the growing of vegetables. The lecturer urged the necessity of everyone, who can, to grow vegetables to assist in adding to the national food supplies. Questions were answered by Mr. Beckett at the conclusion of his address. Mr. Kent, Letchmore Heath, offered, next free, twenty 10-foot plots on one of his fields for the use of growers, and stated that he would give two prizes in connection therewith. The society is arranging a series of lectures on Bee-keeping and Poultry Rearing.

WARWAGE AND DISTRICT GARDENERS.—The annual general meeting of this Association took place on Wednesday, the 17th inst., the Rev. S. M. Winter, a vice-president, occupying the chair. After the minutes had been read and signed and some formal business done, the election of officers was proceeded with. Mr. R. Dow, of Parkwood Gardens, was elected chairman and Mr. F. Masood, of Warwage Court Gardens, vice-chairman. The committee was re-elected, with Mr. W. Clarke in place of Mr. Doc. Mr. H. Colby was re-elected hon. secretary and treasurer. The annual report and balance-sheet were presented and adopted, and were considered satisfactory. It was decided to hold another Potato-growing competition among the members, and also a children's Sweet Pea-show during the year.

FRANK DICKS and CO., 59, Deansgate, Manchester.

SCHEDULE RECEIVED.

Southampton Royal Horticultural Society Summer Show, to be held in the grounds of South Stoneham House, on Wednesday, July 11. Secretary, Mr. C. S. Fudge, 7, Silverdale Road, Southampton.

THE HORTICULTURAL DIRECTORY AND YEAR BOOK.

We much regret that the publication of the Horticultural Directory and Year Book for 1917 has been delayed by unforeseen and unavoidable circumstances. First, the difficulties in regard to printing and paper supplies have increased greatly of late; and secondly, the number of corrections that have to be made this year is altogether unusual, owing to the fact that so many gardeners have joined the Army. To those who have already sent us prepaid orders we offer our apologies for the delay, and assure them that everything possible is being done to expedite publication.

GARDENERS' CHRONICLE, Ltd.,
41, WELLINGTON STREET, COVENT GARDEN,
LONDON, W.C.

ROSES.

THURSDAY NEXT.

MESSRS. PROTHEROE & MORRIS will sell by auction at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on Thursday, February 8th, and every succeeding Thursday at 11 o'clock, consignments of well-grown ROSES, especially lotted to suit all buyers.
On view morning of sale and catalogues had.

SHORTLANDS, KENT.

Unreserved Sale of well-grown Nursery Stock comprising 2,000 Border Shrubs, Golden Privet, Standard, Half-Standard, and Dwarf Roses, 5,000 Herbaceous Plants, 1,000 Fruit Trees and Bushes; also 30 Fowls, 3 Greenhouses, Piping, and Sundries.

MESSRS. PROTHEROE & MORRIS are instructed by Mr. J. B. Bryant to sell the above by auction at the Nursery, Bromley Road, Shortlands.

On Saturday, February 10th, at 12 o'clock.

On view, Catalogues on the premises and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

RICHMOND.

MESSRS. PROTHEROE & MORRIS are instructed by the Trustee to sell by auction at the Common Nursery, Richmond.

On Monday and Tuesday, February 5th and 6th, at 12 o'clock precisely each day,

large quantities of well-grown NURSERY STOCK comprising Golden Privet, Variegated and Green Hollies, Standard Ornamental Trees, Evergreen and Flowering Shrubs, Roses, and a number of Clipped Yew in various fancy shapes.

On view, Catalogues had on the premises, of P. Mason, Esq., the Trustee, 51, Gresham Street, E.C., and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

MARESFIELD, SUSSEX.

Unreserved sale of Nursery Stock, on certain lands, where the tenancy expires on March 25th next, by order of Messrs. Wm. Wood & Son (Hereford), Ltd.

MESSRS. PROTHEROE & MORRIS, in conjunction with Messrs. Wm. Wood, Son & Gardner, will sell by auction on the premises.

THE WOODLANDS NURSERY, MARESFIELD,

On Wednesday and Thursday, February 7th and 8th, at 12 o'clock, each day

Large quantities of Nursery Stock, comprising 25,000 Conifers and Shrubs, 2,000 named and Pomona Rhododendrons, Fruit Trees, 8,500 Deciduous Trees, Nuts, 10,000 Quick, flowering Shrubs, Roses, Climbing, Herbaceous, and Rock Plants, &c.

May be viewed. Catalogues had on the premises, of Messrs. Wm. Wood, Son & Gardner, Local Agents, Crawley, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

TUNBRIDGE WELLS.

Unreserved Clearance Sale of the grounds of 14 Greenhouses, Hot Water Piping, Fats and Lights, Boilers, Slating and Brickwork, together with the Stock of Greenhouse Plants, and a further portion of the Outdoor Nursery Stock, by order of the Trustee of Mr. L. B. Russell.

MESSRS. PROTHEROE & MORRIS have been instructed to sell the above by auction on the premises, the Tunbridge Wells Nurseries, Tunbridge Wells.

On Tuesday and Wednesday, February 13th and 14th, at 12 o'clock precisely each day.

May be viewed. Catalogues had on the premises, of P. Mason, Esq., the Trustee, 51, Gresham Street, E.C.; of C. Butcher, Esq., Solicitor, 35, Gresham Street, E.C.; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

BUSINESSES TO LET.

NURSERY TO LET; commanding position; five minutes from rail and tram; 330ft. Glass; 14 acres land, house, &c.—MILLES, Royal Hotel, Sheerness.

BUSINESSES FOR SALE.

SPECIAL REGISTER OF NURSERIES, MARKET GARDENS, FLORISTS' AND SEED BUSINESSES to be Let or Sold, Published by

MESSRS. PROTHEROE & MORRIS every month. Copies may be obtained post free on application—Estate Offices, 67 and 68, Cheapside, London, E.C.

PROPERTY WANTED.

FARM, not too large, wanted to Purchase on long or short lease or cheap Freehold (not too large), between Brighton and Eastbourne, not far from sea and close to a railway station, Brighton district preferred; must show good average profit in past years; present employees could remain on at good wages. Earns £1000 required to take full charge at liberal salary and share profits; one who is thoroughly experienced in farming in all its branches.—Send full details in first instance to J. C. B., Box 3,873, Willing's, 125, Strand, W.C.

PLANTS, &c., WANTED.

WANTED, large Kentia Fosteriana PALMS, from 5 to 25 feet in height, for cash or exchange—ROBERT GREEN (1911), LTD., 28, Crawford Street, London, W.

WANTED, 1,000 Large ASPIDISTRAS, old plants suitable for stock; cash or exchange. See other advertisements; catalogues free.—SMITH, London Fern Nursery, Loughborough Junction, London, S.W.

WANTED, Quotations on the following ORCHIDS:—Cattleyas: Laurenceana x aurea, Schrieberae x aurea, Mossiae x Gigas, Franca x Gigas, Labata x aurea. Also Cattleya x Hardyana and Brasso-Cattleyas, larger kinds only; all to be unflowered, strong plants, to flower the first season. Also price lists on orchids solicited.—LAGER & HURELL, Orchard Growers and Importers, Summit, N.J., U.S.A.

PLANTS, &c., FOR SALE.

A MARYLLIS (Hybrid of Vittata).—MORLE & CO. offer magnificent named sorts from Mr. W. Bull's celebrated Gold Medal prize collection, also Flowering Bulbs, crossed with named sorts, at half usual prices. List free. 150 156, Fenchley Road, N.W.

JAPANESE LILiums, just landed in splendid condition; large, firm Bulbs, Longiflorum giganteum, 3s. 6d., 6s. and 9s.; Speciosum Melponense and magnificum, and Album Keitizens (the best), 5s., 8s. and 10s.; Auratum, 6s. and 10s.; Henryi, 6s. and 8s.; all per dozen; also others. List free.—MORLE & CO., as above.

SEED POTATOS, Lincolnshire or Scotch, Myatt's Ash Leaf, Hebrons, Early Rose, Express, Royal Kidney, Up-to-Date, Sir J. Llewellyn, Arcton Chief, King Edward, and others, per bush, or cart.—MORLE & CO., as above. Our Seed and Plant List sent on application.

LILY-OF-THE-VALLEY.—Extra special large forcing Victoria crowns, extremely scarce, offered at 10s. 100, planting ditto, 8s. 100; stock limited.—MORLE & CO., as above.

PERPETUAL FLOWERING CARNATIONS, strong, healthy plants, now ready, amongst which are the following varieties: 1s. 6d. per doz. out of sand, 5s. 6d. per doz. in pots.—Enchantress, Snowstorm, May Day, Lady Northcliffe, Madge, Rose Pink Enchantress, 6s. per doz. out of sand, 7s. per doz. in pots.—Enchantress Supreme, Salmon King George, White Enchantress, Clumpion, Triumph. Price List of Latest Novelties on application.—J. C. JENNER, Lynwood Nurseries, Rayleigh, Essex.

MISCELLANEOUS.

NEARLY new LEAN-TO GREENHOUSE, with span roof, 32ft. by 11ft., 3 top lights, 3 front lights, and a return glass end, with 60ft. of 4in. hot water pipes, stove, saddle boiler, all in working order.—Appl., 32, Camden Road, N. Letters only.

SEEDS FOR 1917.

It is none too early for garden lovers to think of seeds, but be sure the seeds you buy are seeds of quality. It is a gardening axiom that

RYDERS SEEDS

are the best, and despite the fact of a War Time price of 1½d. per packet, orders for these famous Flower and Vegetable seeds are daily growing in volume. Seeds of quality cannot now be supplied, even by Ryders, in Penny Packets.

Ryders Illustrated Seed Catalogue Free.

Ryders 1917 Catalogue contains a large number of choice varieties not found in other lists.

Ryders offer in 1½d. packets such standard novelties as—

- Tomato Bide's Recruit, 8 seeds for 1½d.
- "All the Year Round" Cauliflower.
- The New Chinese Celery-Cabbage "Pe Tsai."
- Kychnis Arkwrightii.
- Calceolaria Veitchii.
- New Double Cosmos, pink and white.
- Such Sweet Peas as Jean Ireland, President, Fiery Cross, The Lady Eveline, Yarrowa, and over 200 others.

Send a post-card to-day for your free copy of this Catalogue. Remember the one and only address and beware of imitators—no agents.

IRIS ARIZONICA.*

ON the western side of the North American continent there occurs a group of Irises, of which the best known is perhaps *I. longipetala*, and of which the members most present considerable difficulties to systematic botanists, who deal only with dried material.

The true *I. longipetala* is a strong, stiff plant, confined in the wild state, I believe, to the coast of California, from San Francisco southwards to Monterey. Even in cultivation it is not still showing the effect of the California climate by losing its leaves at the end of the summer and starting into growth again in early autumn, a habit which clearly indicates that its home is in a region where no hard winters occur.

Further inland there occurs another species, which I believe to be the true *I. missouriensis* of Nuttall, and which is to all intents and purposes merely an upland or mountain form of *I. longipetala*. When in flower, it agrees in almost all respects with that species, even to having the characteristically blunt, square-topped standards with a wide emargination or indentation in the centre, and only differs in being more slender in all its dimensions, and especially in its habit of not starting again into growth until the spring when once the leaves have died down in late summer. This is a characteristic which we should expect to find in a plant from mountainous districts with hard frosts in winter.

A third and rarely allied species grows in close proximity to *I. missouriensis*, and, unfortunately, the nomenclature of these two species has become very confused. The name of *holocoma* has been applied at times to both species, and it seems, therefore, better to retain Nuttall's manuscript name of *montana* for this third species. In its habit of growth it closely resembles *missouriensis*, but differs in having pointed and not blunt standards, and in producing usually only two flowers

* *Iris arizonica* spec. nov. *I. longipetala* et *I. montana* affinis. Ab utraque foliis viridibus nec glaucis, usque ad hincem inermem permanentibus, ab illis seque interfoliis acutis nervis emarginatis, ab his seque multifloribus nec bifloris, pedicellis elongatis spatibus longioribus facile distinguuntur.

on short pedicels in contrast to longipetala and missouriensis, which may both have as many as five flowers in a head on pedicels of varying lengths up to several inches.

All the characteristics which I have mentioned, including even the indentation in the standards of longipetala and missouriensis, have proved to be constant here in successive generations of seedling, but it can easily be realised that, in cases where the standards of the flowers are either invisible or damaged, it is extremely difficult to separate herbarium specimens with any degree of certainty.

A further difficulty arose when in 1902 a description was published in Coultter's *Botanical Gazette*, XXVII, p. 62, of an *Iris pelocoma* from Wyoming. It is said to resemble *missouriensis*, but to be much smaller, though proportionately stouter. From the fact, however, that it has only one or two flowers on each stem, and that the spathe often reach halfway up the falls, it seems more probable that it is more closely allied to it (or a mere form of the plant which I take to be *montana*, and not *missouriensis*).

In 1911 I was looking through a number of herbarium specimens of this group of Irises, and to my puzzling example from an altitude of 8,000 feet in Barfoot Park among the Chiricahua Mountains of Arizona, there was attached a large packet of seeds. These had been in a museum for several years, but I could not resist the temptation of sowing half a dozen in the hope that they might yet germinate, and that the resultant plants might help to settle the difficulty that I felt in determining the identity of the specimen.

It is, however, the result has been, rather to increase than to decrease the difficulties presented by this puzzling group of plants, for this Arizona *Iris* has proved after several years' cultivation in my garden to be quite distinct from either of the three or four species mentioned above.

The foliage, which grows to a height of two feet or a little more, with a maximum breadth of about 1 inch, is very dense, denser even than that of *I. longipetala*, and of a duller, yellowish green, without the glaucous, grey tinge of the other species. Another point of difference becomes very obvious as summer passes into autumn, for the leaves of *I. arizonica* remain fresh and green long after those of the allied species have withered away. It is not, in fact, until late October or November that the leaves become a pale sickly yellow colour, and begin to collapse. It is obvious that in this respect *I. arizonica* behaves exactly as do the various forms of the Asiatic *I. ensata*. Among Apogon Irises similarity of the seeds is always a sign of affinity in other respects among the plants, and these of *I. ensata* are practically indistinguishable from those of the members of the longipetala group. In December it is hard to distinguish plants of *I. arizonica* from plants of *I. ensata*, though neither of these could be confused with *I. longipetala* or its other relatives.

The flower-stems of *I. arizonica* are about equal in length to the leaves, and bear a terminal head of three to five flowers on long pedicels of varying lengths up to 4 inches. A lateral head of one or two flowers is occasionally produced about 6 inches below the top of the stem, as in *I. longipetala*. The spathe valves are very narrow, 2.5 inches long, clinging closely to the pedicels and becoming saucy and of a deep grey colour at flowering time. The three-sided ovary is a little more than half an inch long, while the perianth tube scarcely measures as much as one-quarter inch.

The flowers resemble those of *I. longipetala*, but are slightly smaller, and less conspicuously marked. Both species have, however, a central lobe on the haft of the falls, sprinkled with purple dots on a whitish ground. As the narrow haft expands gradually into the blade the white ground becomes veined with violet purple, and bears in the centre a yellow blotch. Beyond this the veins spread, the colour becomes a little paler

and covers the whole surface. There is some variation in the shade of violet-purple. The length of the falls is a little more than two inches, and the blade measures a little less than an inch across. The standards are narrow, oblong-ovate, pointed, and not emarginate, about 1 1/2 inch long, violet-purple in colour. The styles are short with small triangular crests, and the stigma entire or only obscurely lobed. The filaments and the anthers are both a pale mauve, while the pollen is cream coloured.

The ripe capsules have thin membranous walls, like those of the other members of the group, taper slightly towards either end, and in section are roughly triangular, with slightly inflated sides. The seeds are dark brown, smooth, and pear-shaped, with a minute whitish circle or aril at the upper end.

May I, in conclusion, ask any American gardeners and botanists who may chance to see these notes to be so good as to send me a few seeds of any Irises of this group of which they may happen to possess plants from known localities, or which they find growing wild. It is, I am sure, only by growing all obtainable plants side by side and by comparing them as they grow that the species can be separated and described in such a way as to differentiate them satisfactorily one from another.

I. arizonica is not, perhaps, so striking a garden plant as *I. longipetala*, but it is interesting as a link connecting that species and its American relatives with one of the most widely distributed of Asiatic Irises, namely, *I. ensata*. W. R. Dykes, *Charterhouse, Godalming*.

ORCHID NOTES AND CLEANINGS.

CATLEYA RAINBOW.

A FLOWER of one of the most beautiful of their new hybrids, flowering in 1916, and named *Catleya Rainbow*, is sent by Messrs. Sander and Sons, St. Albans. It was raised by crossing *C. Alcinæ* (*Iris chabiata*) and *C. Dowiana Rosita*, and in the hybrid it is interesting to note that in the sepals and petals the rose-purple of *C. chabiata* and the heavy freckling of claret red of *C. Dowiana Rosita* are suppressed and the colour of typical *C. Dowiana* retained, although in the yellowish cream colour of the sepals and petals of *C. Rainbow* there is the faintest underlying suggestion of colour on the exterior. The handsome labellum is magenta crimson with well defined chrome-yellow lines running from the base to the centre and merging in the broad bright yellow disc. The margin of the lip is crimped and slightly fringed, and although in its broad expansion it follows *C. Dowiana*, there is some indication, in the interrupted outline between the front and side lobes, of *C. bicolor*, one of the parents of *C. Iris*.

CYPRIPEDIUM FROM WALTON GRANGE.

MR. J. HOWES, from the gardens of the late William Thompson, Walton Grange, Stone, Staffs.-Here, sends a box of magnificent blooms of some of the fine *Cypripedium* in flower there. Several of the largest and best are seedlings not yet named. Of the new forms of unrecorded parentage, *C. Hermes*, *C. Harold* and another suggesting an improvement on *C. insigne* Harold Hall, are especially good. The two forms of named kinds include *C. Euryades* Walton Grange variety, a flower of large size and richly marked; *C. Thibe*, like a fine *C. Pyramus*, with very large dorsal sepal spotted with a network; *C. Actæus* Bienen, one of the most beautiful of yellow and white *Cypripediums*; and *C. insigne* Snow Queen, a charming variety of similar colour. The most remarkable of the others are *C. Arthurianum* Walton Grange variety, of dark colour; *C. Troilus* Impregnable, a noble flower; *C. Victor Hugo*, *C. Fitzhugh*, *Palatte*, *C. Leocorum* Corona, *C. Leeanum* Mary Amelia, *C. Noel*, a grand flower

of the *C. Dreadnought* class: *C. Nubia* and *C. Diomedes*, Keeling's variety. We understand that the collection will shortly be disposed of by auction sale.

NEW HYBRIDS.

A FLOWER of the new *Cymbidium* Beechler hybrid is sent by Messrs. Hassall and Co., Southgate, who raised it from *C. Lowianum* and *C. Schlegelii* (*insigne* × *Wiganianum*). Its main features are of *C. Tracyanum*, which, with *C. orbucum*, produced *C. Wiganianum*, and is an instance of reversion to the most distinct ancestor. The sepals and petals are greenish white, with dotted red lines. The lip is very

NEW CHINESE PLANTS.

ACER DAVIDII

ACER DAVIDII (see fig. 17) is a native of Hupeh, Ichang, and other parts of Western China, where it was collected by Mr. E. H. Wilson in 1907 B. The tree grows wild in altitudes ranging up to 2,700 m., in woods and by the sides of streams. The foliage does not suggest a Maple, for the leaves have more the shape and general appearance of the Portuguese Laurel. The petioles are of a ruby colour, and a tree in full foliage is a very striking object, but the chief beauty of this new tree lies in

Wilson describes the species as a very handsome tree, resembling in habit *P. lasiocarpa*, and with leaves almost as large as in that species. The foliage is coloured red and bronze in early spring, and the colouring runs into the stems, a feature which is absent from *P. lasiocarpa*. Moreover, cuttings strike readily, which is not by any means the case with its congener. The plant illustrated is growing in a frame in the Hon. Vicary Gibbs's gardens.

VEGETABLES.

INCREASING THE ONION CROP.

GROWERS in this country have been slow in realising the importance of the Onion crop, and how easily more land could be devoted to the growing of the bulbs with a reasonable prospect of success. The extraordinary prices English Onions have made during the past two years as compared with those obtained in former years should encourage growers to plant an extended area with Onions in the near future. They should be grown more also in cottage gardens.

A reasonable crop to expect is from four bushels to six bushels per rod (forty bushels to the ton), according to the variety. For an acre, 10 lbs. seed would be required, costing approximately £8. Four good varieties are Maincrop, Rousham Park, James Long Keeping and Bedfordshire Champion.

A fairly stiff loam is perhaps the most suitable of all soils, and the Onion being a gross feeder a good dressing of farmyard manure is necessary; this is best applied in the autumn and ploughed or dug in. In gardens and small plots trenching is much the best method of bringing the soil into a desirable condition for this crop. The Onion is a deep-rooting subject, and shallow soils are of little value unless extra treatment be given them. Suitable ground should be trenched at least 2 feet deep, adding manure as the work proceeds, and leaving the surface as rough as possible to be pulverised by the weather. Choose a dry time at the end of February to fork over the plot to obtain a good tilth for sowing the seed. Onions require firm ground to root in, therefore make the soil firm by treading or rolling. If farmyard manure was not dug in the ground in the autumn a concentrated fertiliser should be spread over the surface before forking the ground in preparation for seed-sowing in March. Three-parts of superphosphate to one of sulphate ammonia, at the rate of 10 lbs. per rod, will stimulate growth, to be followed as growth proceeds with occasional dressings of soot in showery weather. Make the surface very fine, and draw shallow drills 14 inches apart, sowing the seed evenly. If wood ashes are available for a small plot, cover the seed thinly with the ash before finally filling in the drills with soil, and rake the surface fine.

Another form of Onion culture which has much to recommend it is to sow seed in a cold frame at the end of February to allow a longer time for the plants to grow. Sow the seed either in boxes of prepared soil or on a bed in the frame. Keep the frame closed until the plants show through the soil, and at that stage admit air freely to induce a stocky growth. When the plants have made good roots and a sturdy top, being then large enough to handle, plant them 4 inches apart in drills made 14 inches wide.

If extra large bulbs are required special treatment is necessary. Extra rich, deeply-trenched soil is essential, and the plants must receive constant attention in the way of watering and daily syringing in hot weather. Sow the seed early in January in boxes filled with rich soil and germinate them in a temperature of 55°. Gradually harden the seedlings as growth proceeds, and when large enough to handle, prick them out in other boxes or in a cold frame or a prepared bed of rich soil. The Onions

FIG. 17.—*ACER DAVIDII*, A NEW CHINESE SPECIES WITH VARIOUSLY COLOURED BARK

near to *C. Tracyanum*, white, with red-brown lines from the base and a band of the same colour near the margin.

Cymbidium Sybil, obtained by the same raisers between *C. orbucum* and *C. Pauwelsii* (*insigne* × *Lowianum*), is a handsome, pale-green flower with numerous red-dotted lines on the sepals, the broad cream-coloured lip being finely marked with clay-coloured lines, and larger linct-red blotches on the front lobe.

Odontioda Bernellie is a richly coloured hybrid raised in the collection of C. J. Phillips, Esq., The Glebe, Oak Lane, Sevenoaks, between *Oda*, Charlesworth and Odin, Her Majesty. The hybrid promises, when mature, to prove distinct.

the bark, which is striated in a bizarre manner, yet the surface is perfectly smooth, although the irregular lines of purple grey, yellow, green and other colours look as if they were in fissures. The whole appearance of the bark suggests a piece of polished, coloured marble and is almost unique amongst stem colourings. The photograph reproduced in fig. 17 was taken by Mr. C. W. Cole last autumn in the Hon. Vicary Gibbs's gardens at Aldenham House, Elstree.

POPULUS SZECRUANICA.

THIS new Poplar (see fig. 18) was also collected by Mr. Wilson. In *Planta Sinensis* it is stated that it grows in the moist forests of Szechuan between 2,200 and 3,500 m. altitude.

may be planted in their permanent quarters in rows made 15 inches apart, lifting the roots then with a ball of earth attached.

The field culture of Onions is likely to increase considerably in the coming season. The object of the grower is to obtain a heavy crop of medium-sized, firm bulbs that will keep well into the spring. The land should, if possible, be prepared in the autumn by ploughing in, not too deeply, 20 tons of farmyard manure to the acre. In February, if the weather is suitable, the land should be ploughed again deeper. The manure having by this time become decomposed, the ploughing will disintegrate the portions, rendering it further available for assimilation. Early in March apply a top-dressing of artificial manure at the rate of 10 cwt. per acre, of superphosphate 3 cwt., and sulphate of ammonia 2 cwt. Cultivate the soil and harrow these fertilisers in, afterwards making the soil quite firm by rolling it, especially if it is light in texture. A fine tilth is necessary for sowing the seed, which should be used at the rate of 10 lbs. per acre, in drills made 14 inches apart. Keep the ground free from weeds by hoeing, but not too deeply, leaving the soil very firm about the roots. Do not thin the plants, but allow them all to grow, for the object is not so much large bulbs as quantity.

If the land is fairly strong and in good "heart," no further stimulant will be required beyond an occasional sprinkling with soot or wood ash. If the soil is light in texture and the plants appear to drag in their growth, especially during times of dry weather, sprinkle it in the evening with sulphate of ammonia. The inexperienced would be wise in applying such stimulants as nitrate of soda with extreme care, for should a wet autumn prevail the ripening of the bulbs would be considerably retarded by an extensive quantity of nitrate of soda. *E. Molyneux.*

THE WART DISEASE OF POTATOS ORDER OF 1917.

THE Board of Agriculture and Fisheries, by virtue and in exercise of the powers vested in them under the Destructive Insects and Pests Acts, 1877 and 1907, and of every other power enabling them in this behalf, do order, and it is hereby ordered, as follows:—

PROHIBITION OF PLANTING OF POTATOS ON PREMISES WHERE WART DISEASE HAS OCCURRED EXCEPT BY LICENCE.

1. No person shall plant Potatos, or cause or permit Potatos to be planted, in any field, garden, or allotment in his occupation on which Potatos affected with wart disease have been grown in a previous year, unless such planting is authorised by, and is in accordance with the conditions (if any) imposed by, a licence granted by an Inspector of the Board of Agriculture and Fisheries or of the Local Authority, and any person who shall plant Potatos, or cause or permit Potatos to be planted, in contravention of this provision, or who shall permit to remain in any field, garden, or allotment in his occupation, anyone planting Potatos in contravention of this provision, shall be liable on conviction to a penalty not exceeding ten pounds, unless he proves to the satisfaction of the Court that he did not know that Potatos affected with wart disease had been grown on the land in a previous year.

EXTENSION OF RESTRICTION ON PLANTING IN INFECTED AREA.

2. Any person who shall permit to remain in any field, garden, or allotment in his occupation, which is situate in an infected area declared for the purposes of the Wart Disease of Potatos (Infected Areas) Order of 1914, Potatos which have been planted without the authority of a licence granted under that Order or otherwise than in accordance with the conditions imposed by a licence so granted, shall be liable on conviction to a penalty not exceeding ten pounds.

DEFINITION.

3. The expression "wart disease" means the disease affecting Potatos which is known as *Synchytrium endobioticum* or wart disease of Potatos, black scab, Cauliflower disease, or Potato canker; and the expression "the local authority" means as regards any district the local authority for the district under the Diseases of Animals Act, 1894.

COMMENCEMENT.

4. This Order shall come into operation on the first day of February, nineteen hundred and seventeen.

TREATMENT OF STRAWBERRY BEDS.

I VENTURE to explain the system of cultivation that is carried out with this crop in these gardens. In the final preparation of the ground soil and situation are taken into consideration.

Different treatment is necessary according to the length of time the beds are to remain in a cropping condition. I prefer to make fresh plantations on all kinds of soil at least every third year, and in some cases I have made them annually, but with this latter method the plants may be put closer together, 15 to 18 inches between the rows, and a foot between the plants in the rows being sufficient. If the plants are to be left in the beds for two or more seasons, a thorough tilling of the plot is carried out, trenching the site 2 to 5 feet deep, and working at least two layers of dung into it; if the land be light, cow or pig manure is preferred; if heavy, stable manure is suitable. Differences of opinion exist as to whether the bottom spit should be brought to the surface or not, but this should be decided by the operator, according to soil conditions. If the bottom spit consists of wet, heavy soil, work plenty of opening material into it and leave it where it is for this season, to be brought up another time, when it will be found in better condition. Should it be good soil, that has been well worked previously, do not hesitate to bring it to the surface. As the work proceeds we mix plenty of burnt refuse into the soil, and if lime is deficient this also is applied. If dung is limited basic slag is well worked into the lower spits, which supply lime and phosphates.

I prefer to get this operation performed as early in the winter as possible, so that frost and air may well permeate the whole. A method I generally follow is to plant this plot with early Teas, or early and mid-season Potatos; both crops are off the ground before planting time. We put the rows from 1 to 2½ feet apart and the plants from 1 to 2 feet in the rows, according to variety. A method I have also tried with success where ground is limited, and where the plants were intended to stand more than one season, is to plant 15 inches between the rows and 1 foot in the rows, chopping out alternate rows and plants after the first season. This is the method I always follow when a fresh bed is made every season. After fruiting, the whole batch is cleared away and the ground makes an excellent position for late green crops.

Good sturdy runners are procured as early as possible, and layered into small pots in a good compost of loam, wood ashes, and horse droppings, three parts of the former to one of the latter, with a portion of grit if the loam is heavy. The young plants are usually planted out during August, and before the pots are too full of roots, spreading out the roots during the operation. They are kept well watered until established, and the surface soil is kept stirred with the Dutch hoe; mulching is also practised if light material for this purpose is available. Where our beds stand over one season, my practice is to give a good dressing of decayed manure directly the beds are cleared of fruit and rubbish, and I consider this to be preferable either to winter or spring mulching, as it keeps the roots and soil cool and moist during the hotter months of the year. By the time winter comes it is in better condition for the plants than the heavy mulch of wet manure around the collars of the plants applied in winter or spring, whereas the manurial qualities are still present for the roots to absorb. When the plants show signs of becoming active again a dressing of some fertiliser, or soot and superphosphate, is applied, and very lightly turned into the soil with the old mulch. Here I may mention that my objection to the heavy spring mulching is that it stops the air and sun, so beneficial at this early period, from

reaching the roots, and retards growth instead of helping it, unless turned into the surface directly it is applied. Should the plants become dry before the flowering period a good watering is given; disfigured fruits are frequently produced through dryness at the flowering stage. After the fruit is set another good watering with some sort of manure water more than repays the trouble, especially on light soils. The long, strawy material is placed in position in good time, so that the fruits may be free from grit; but a good dressing of soot is first applied, and not only proves beneficial, but checks the attack of slugs on the fruit later. To obtain a long succession of fruits old varieties are chiefly relied on, and aspects of different degrees of earliness. There are several new varieties of Strawberries, but good supplies are obtained over a long period with the following varieties:—Royal Sovereign, Joseph Paxton, Waterloo, and Givon's Late Prolific. A change of stock should be made occasionally. Alpine Strawberries may also be grown for very late fruits, pinching off all flower trusses until July, after which they will produce some nice, sweet fruits. Should the autumn months prove very wet old garden lights may with advantage be placed over the plants. *H. E. Kemp, Priory Gardens, Reigate.*

TREES AND SHRUBS.

TREES AND SHRUBS CERTIFICATED.

The article on page 24 of the *Gardeners' Chronicle* on plants that have received honours from "The Floral Committee of the Royal Horticultural Society" serves to call attention to the fact that many look upon certificates and awards as being granted only to new or comparatively new plants.

That this is not the case was proved early in 1916, for at the meeting on January 11 a First-class Certificate was bestowed upon *Abies bracteata*, of which one bearing branches were shown from Berry Hill, Dorking. This Silver Fir, which is a native of California, was introduced as long ago as 1853 by William Lobb, when travelling in Western North America on behalf of Messrs. Veitch. Though a striking Silver Fir in every way, it is, generally speaking, not a success in this country, being particularly liable to injury from late spring frosts. Strange to say, the same collector was also answerable for the second certificated subject, namely, *Tricuspidaria lanceolata*, as it was first introduced by him from Chile in 1848, and later on by Richard Pearce, of Tuberous Begonia fame. It is hardy only in the more favoured parts of these islands, and succeeds best where there is a liberal amount of atmospheric moisture. This beautiful and distinct shrub has beside the above name been also known as *Tricuspidaria dependens*, *Tricuspidaria hexapetala*, and *Crinodendron Hookerianum*.

The third certificated was awarded to *Rosa Moysesii*, a true species from China, with rich crimson flowers and golden anthers. Its bottle-shaped fruits also form an attractive autumn feature. It is by no means a novelty, having been given an Award of Merit in 1908, but in 1916 this was increased to a well-deserved First-class Certificate. This honour was in all gained by five shrubs, the remaining two being *Berberis*, and, strange to say, they were both shown on the same day, namely, on November 7. The first, *Berberis Nagentiana*, obtained an Award of Merit the previous year. It is an ever green species related to the Himalayan *Berberis Hookerii*, but is said to be much harder than that kind. The second, *Berberis ruberostilla*, an accidental seedling raised at Wisley, can claim to be a novelty, as it is not in general cultivation. It is deciduous, and remarkable for the great profusion of its rich coral-red drop-like berries. An Award of Merit was given to *Enonymus latifolius*, which has been grown in British gardens since 1730. *J. T.*

PLANTS UNDER GLASS. & 202

By J. G. WESTON, Gardener to Lady Northcote, Eastwell Park, Kent.

SEED-SOWING.—Seeds of many choice plants are exceedingly minute, and require the greatest care in handling. Amongst those that require sowing this month are *Streptocarpus*, *Cockscomb*, *Coleus*, *Begonia*, *Gloxinia* and *Celosia*. Use a very light compost, consisting of light loam, fine peat, and leaf soil in equal parts, with some sharp sand added. Let the pots or pans be filled to within 1 inch from the top, and the surface made perfectly level with very fine soil, and watered before sowing the seed. Very fine seeds should not be covered with soil, it is better to press the soil lightly after the seed is sown, which is all that is required. Place the seed-pans in a house where the temperature is from 65° to 70°. Keep a close watch, and never allow the soil to approach dryness. Pans containing choice seeds should be covered with sheets of glass, and shaded with cloths of paper till germination takes place. Seeds of *Asparagus Sprengeri*, *A. plumosus* and *A. deflexus*, *Grevillea robusta*, *Cyperus alternifolius* and *C. natalensis* should be sown now; also *Clivias*, *Anaryllis* and *Asparagus medeoloides*, often grown under the trade-name of *Smilax*.

GLOXINIA.—Tubers of *Gloxinia* that have been stored since last autumn should now be shaken out preparatory to starting them into growth. To economise space the tubers may be placed in shallow boxes, with a little light soil round them. Stand the boxes in a Cucumber or Melon pit, or other place, where there is sufficient atmospheric moisture to start them into growth. Spray them lightly on fine days, but do not give the plants much water at the roots in the early stages. When growth starts keep the plants well up to the glass or the foliage will become drawn.

HIPPEASTRUM (AMARYLLIS).—Old bulbs of *Amaryllis* that have been resting in a cool house should now be brought into heat to flower. See that the drainage is quite free, and place the pots on a bed or stage in a moderately warm house. One good watering should be given, after which a very moderate quantity only will be necessary till growth is active. Spray the plants over on fine days, and fumigate occasionally for thrips.

SEEDLING AMARYLLIS.—Keep young plants growing without any resting period till they have flowered. Give sufficient space to keep the foliage firm and healthy, growing the plants at this season where they have the maximum amount of sunshine.

CLIVIA. Improved forms of *Clivias* are now procurable, completely outclassing the old *miniata* type, the foliage being longer and broader, and the flowers superior, both in form and colour. Plants now resting in a cool house will quickly start into growth and flower if brought into a higher temperature. A viney just started is a very suitable place. When the pots are crammed with roots manure water may be given with advantage. Plants requiring more root-room should be potted directly after flowering.

THE PROPAGATING HOUSE.—Make the propagating house ready for use, giving the interior a thorough cleansing. Clear out the old hotbed material and that used for plunging, as it usually becomes infested with wood-bore, cock roaches and other insect pests. Wash the glass and woodwork, and lime-wash the walls if necessary. Use a little soil fumigant in the fresh plunging material. I also find it a good plan to sprinkle a little of the fumigant by the water-pipes, and in any dry crevices where insects lurk.

THE SHOW-HOUSE OR CONSERVATORY.—The cleaning and rearrangement of the permanent plants in these houses should be undertaken

now, before the potting season arrives. Palms, *Cordylines*, and similar plants that have outgrown their spaces should be transplanted in more suitable positions. Soft-growing plants, such as *Abutilons* should be cut hard back. Cleanse the interior of the structure and the plants before re-arranging the occupants.

THE FLOWER GARDEN.

By W. J. GIBSE, Gardener to Mrs. DEMPSTER, Keele Hall, Staffordshire.

SWEET PEAS.—Sweet Pea plants raised from seed sown last autumn should be shifted into larger pots. Place small pieces of Birch twigs in the pots to support the young shoots. Another sowing may be made now in 5-inch pots, boxes or turves. Germinate the seeds in a warm pit and remove the seedlings directly they appear above the soil, to cooler quarters. Precautions must be taken against slugs before placing the plants in the frames by dusting the surface soil with soot. Admit air on all favourable occasions and at no stage coddle the plants, or they will grow weakly. The ground for Sweet Peas should be prepared well in advance, leaving the surface as rough as possible to be pulverised by frost. Dig the soil to a depth of 18 inches to 2 feet and incorporate with it a reasonable quantity of well-decayed manure, leaf-mould and wood ash. The amount of manuring must not be overdone, or the flower-buds will turn yellow and drop at the flowering stage. In favoured districts Sweet Peas may be sown in the open now, choosing a warm, sheltered border.

ANTIRRHINUM.—Here at Keele we sow *Antirrhinum* seed in well-drained boxes, in a compost of loam, leaf-mould, and sand. The soil is watered through a fine rose a few hours previous to sowing, which is done thinly, the seeds being lightly covered with fine soil. The boxes are placed near the roof-glass in a house having a temperature of 60°, and are covered with squares of glass and shaded with paper until the seeds have germinated. After a short period the boxes are removed to cooler quarters to ensure the seedlings making sturdy growth. They are pricked out into heated, shallow frames, in which is placed a layer of decayed stable manure on an ash bottom, the surface of the manure being covered with 4 inches of old potting soil. The seedlings are placed 4 inches apart each way, sprayed, and shaded daily for a week or ten days. Air is admitted gradually, the plants hardening finally by the middle of May. The intermediate varieties are most suitable for bedding, such sorts as *Bright Pink*, *Fire King*, *Orange King*, *Coral (red)*, *White*, *Crimson*, and *Yellow*, whilst others of the dwarf section can be employed for the front rows. For massing in large groups or planting in the mixed border the tall varieties are very effective.

EAST LOTHIAN STOCKS.—The seed of *East Lothian Stocks* should be sown at once to secure plants for flowering early. Sow the seeds in well-drained pans or boxes, in a compost of loam, leaf-mould and sand. Cover them lightly with fine soil and germinate them in a temperature of 55° to 60°. Pot the seedlings in 3-inch pots directly they are large enough to handle, and grow them near the roof-glass. Cool conditions are essential to the production of strong, sturdy plants.

FRUITS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD or ROTHSCHILD, Esq., C.V.O., Gurnersbury House, Acton, W.

PINES.—I do not propose to deal comprehensively with the treatment of the Pineapple, as the cultivation of this fruit has declined much of late years owing to the increased imports. These imported Pines may now be purchased so cheaply that it does not pay to grow the *Cayenne* or *Charlotte Rothschild* varieties in hot-houses at home. With the *Queen variety*, however, it is different, as there is no other Pine that approaches it in flavour, and a small house or pit might be devoted to the cultivation of this special sort. Moreover, the *Queen variety* may be grown more closely together than the others I have named, whilst the minimum tem-

perature during the winter, or resting season, may be quite 5° less than the others need. Those who are growing the Queen variety should pay close attention to watering; do not allow the plants, in whatever stage, to become very dry, and guard also against over-watering. With the additional warmth in the water-pipes at this season the atmospheric moisture will be considerably reduced, and this state, if accompanied by drought at the roots, might cause a sufficient check to induce adventitious fruiting. Whilst wintry weather lasts the night temperature need not exceed 60°; if the thermometer registers 55° in the morning there will be ample warmth.

VINES IN POTS.—Pot vines that were started in November are pushing into growth freely. The work of disbudding should be completed without further delay; a few shoots may be gaining an ascendancy over the others, and these gross growths should be stopped two joints beyond the bunch. Where the vines are making a good show of bunches one bunch will be sufficient for each shoot. Allow a good margin of surplus ones, however, until the setting is safely over. The night temperature should be 60°; it may fall a few degrees in the morning, but should reach 70° by fire-heat and 75° by sunshine in the daytime. The house should be 5° warmer when the vines are in flower. If fermenting material be used let it be only of a moderate warmth. It is not essential, and in any case should not raise the temperature of the pots more than 5° above that of the mean temperature of the house. Do not be in a hurry to fasten the shoots to the wires, for this work should be done gradually, and if it is completed by the time the bunches are thinned it will be sufficient.

PEACHERS AND NECTARINES SHOWING FLOWER.—By the time these lines are in print some of the earliest Peaches and Nectarines will probably be in flower. For securing a good set I find nothing better than having a hive of bees placed in the house. In this locality we have frequent periods of dull, sunless weather, hence a hive of bees is more effective than the use of the time-honoured rabbit's tail or the camel's hair brush. A good night temperature at such times may be taken at 52° to 55° preferably the lower. A fall of 5° by the early morning will not do any harm. Of course, the fire should be started on early in the morning in frosty weather. I do not advise any damping down during the flowering period unless it be on a bright sunny day, or when the water-pipes have to be kept somewhat on the warm side. Unless the wind be very keen and piercing, a little ventilation is advisable, and this should be equally distributed. In such houses, and at such times, no plants in pots should be tolerated upon which green fly is disposed to congregate. If this be the case these insects will soon injure the young, succulent leaves of both the Peach and the Nectarine. In houses where no flowers are yet open it will be inadvisable still to syringe the trees lightly, but not late in the afternoon.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVY, Abbots Wood, Goolabring, Surrey.

ESPALIER FRUIT TREES.—Wooden stakes to which espaliers are trained require to be renewed frequently, and, as the trees grow, larger ones are needed. Choose straight timber for the purpose and cut it into lengths of the required size. Let the uprights into the ground by means of an iron bar, for driving them in with the mallet would break or crush the tops. The bottoms of the stakes should be dipped in creosote to make them last longer. Strong Bamboo canes make very good cross or horizontal pieces. Tie the branches straight along these, allowing room for the summer growths to be trained in. Prune all long spurs to two eyes; nothing is gained by leaving the spurs very long, and they often send out a mass of shoots that need to be cut away in the growing season. Trees that are making gross growth should be root pruned. Scale insects and other bark pests should be promptly dealt with. The bark should be scrubbed with either a solution of N. All preparation or a mixture made

up as follows: Dissolve 2 lb. soft soap in 2 gallons of boiling water; to this add ½ pint petroleum emulsion; mix thoroughly and add about 6 gallons of soft water. Work the specific into all affected parts with the brush.

STRAWBERRIES.—Where fresh plantations of Strawberries were made last August and September the rows should be gone over and any plants that may have become loosened or lifted from the effects of frost made firm. Whilst doing this remove with the hand all weeds that are noticed. Weeds grow and spread rapidly on light soils.

LOGANBERRY AND WINEBERRY.—The Logan berry requires plenty of room; the shoots may be trained on tripods or on strained wires, which should not be less than 6 feet in height. In pruning cut out all the old canes, tie the young, strong shoots with tarred string to the required height and then shorten the tops. Good, strong, firm soil suits this Rubus to perfection, more especially if it is on the moist side. The Japanese Wineberry should be treated similarly.

APRICOTS.—The pruning and training of Apricots on walls should be completed before the other trees, as this fruit is the earliest to flower. It will be necessary to protect the blossoms in times of frost, but the material should not be placed in position until the last moment. The Apricot grows well in almost any good soil that is well drained, but light ground is the most suitable. Guard against drought at the roots, for light soils near walls soon dry out; and when applying water it is necessary to soak the soil thoroughly on more than one occasion. The finest Apricots I have seen were grown in a paved yard, the roots receiving moisture when the yard was washed, and occasionally liquid manure from the cowyard. In gardens in the south and south-west Apricots may be grown in standards with a certain amount of success, the variety Broda being the most suitable for this purpose. It is best to plant the trees in the beginning of October, but planting may be done now. Fan-shape is the best system of training, as this method permits gaps being more readily filled, and the branches do not admit of horizontal training. The tree produces its fruits on shoots of the previous summer's growth and also on spurs of greater age. The finest, however, are produced on wood one and two years old; therefore, train on a number of such shoots. The trees are subject to attack by a small yellow caterpillar, which must be sought and destroyed. Fasten the shoots loosely, for tight ties may injure the bark and cause gummying. The borders may be enriched by lime rubble and bone meal forked in lightly.

BIRDS.—As the buds begin to swell keep a sharp look out for birds, and either trap or shoot them. To prevent birds injuring the buds of Gooseberries spray the bushes with a mixture of paraffin and lime. This will not only keep birds away, but destroy any moss and lichen growing on the branches. Mix half a pint of paraffin in a quart with about 4 lb. of lime. The foot syringe pump is an excellent machine with which to do this kind of work.

THE KITCHEN GARDEN.

By J. DENN, Foreman, Royal Gardens, Windsor.

MUSHROOMS.—Horse droppings should be collected daily and placed in a dry, open shed, where they may be turned frequently. When a sufficient quantity of dung has been collected and turned sufficiently it should be removed to the house in which the bed is to be made and left loose for a day or two until the temperature from fermentation is 30°. At that stage the bed should be formed, ramming the material tightly. The bed should be spanned when the temperature is declining slightly, inserting the spaw 2 inches below the surface, covering the litter with new loam to the depth of 1 inch and making it firm by the back of a spade. If the surface of the bed becomes dry it should be lightly syringed with clear water, but frequent applications of water should be avoided, it being better to damp the floor and walls with a view to producing atmospheric moisture. The temperature of the house should be about 55°, and the fire-heat should be used as little as possible.

SEAKALE.—Maintain a constant supply of Sea kale by introducing roots to the forcing quarters at regular intervals; it will be a clear fortnight before the heads are ready when forced in a temperature of 65°. A mild hotbed may be set apart for the purpose, and the crop must be grown in perfect darkness. Small quantities of this vegetable may be grown in pots or boxes; the roots should be made firm in fine, rich soil, which should be watered when dry. If large quantities are required, the forcing should be done on mild hotbeds, each of a sufficient size to give a week's supply. A layer of rich soil 1 foot deep should be placed over the bed, and the roots set as closely together as possible in rows made 6 inches apart. Make the soil firm with the foot as the roots are inserted with the aid of a spade. If the soil is not sufficiently moist, it should be watered thoroughly before the covering material is placed in position. Care must be taken that the bottom heat does not exceed 70°. While the roots are being lifted for forcing a sufficient number of straight, clean thorns should be secured for next season's stock. Prepare the cuttings and insert them closely together in a sheltered border, covering them with 3 inches of sandy soil. By the middle of April they will have made sufficient progress to be ready for planting in well prepared ground. At Frogmore we grow about 20,000 crowns in this way.

ARTICHOKES.—This crop should be lifted and stored as soon as possible, and as the work is being done a sufficient quantity of medium-sized tubers should be selected for new plantations, which may be made as soon as possible. Select rich ground in some back part of the garden and plant in rows 4 feet apart, covering the sets with at least 4 inches of soil.

TOMATOS.—Plants raised from seeds sown early in October should be ready for their final potting. A compost of three parts turfy loam and one part decayed horse droppings, with sufficient sifted fine rubble to keep the compost porous, is suitable. Crock the pots carefully and pot firmly, leaving sufficient space for a subsequent top-dressing. Water the plants thoroughly the day previous to potting them; when water becomes necessary again it should be applied in sufficient quantity to moisten the whole of the soil. Grow the plants in a temperature of 65°, and if the pots can be placed on a moderate hotbed, so much the better, as this will promote root action. They must be kept as near the roof-glass as possible in order to keep them from becoming drawn, and ventilation should be given with the same object in view.

LEEKS.—A small sowing of Leek seed may be made now to secure plants for early supplies. Sow the seeds thinly in boxes of fine, rich soil and germinate them in a slightly warm pit. As soon as the plants are large enough they should be transplanted into boxes. After they have commenced to make fresh growth they must be freely ventilated, but never subjected to cold draughts. When a few inches high they should be gradually hardened off and planted out as early in the season as circumstances will permit.

SPINACH.—A good sowing of summer Spinach should be made as soon as the soil is sufficiently dry, in order to obtain a supply of leaves very early in the season. Choose a sheltered border, and keep a careful watch for slugs, as the seedlings are liable to be destroyed by these pests as soon as they are through the surface. Frequent dustings of soot will serve to keep slugs in check.

PARSLEY.—Remove all decaying foliage from Parsley plants and stir the surface of the soil lightly with the Dutch hoe. Plants in pits must be freely ventilated, only closing the lights during sharp frosts or snow. If the supply of leaves is likely to be short, a sowing should be made in boxes or pans with a view to producing plants for pricking out into a cold frame or planting on a sheltered border. Sow thinly and germinate the seeds in a warm pit.

SMALL SALADS.—Make frequent small sowings of Mustard and Cress and make preparation for a continual supply of Radishes by forming a gentle hotbed on which to sow the seeds thinly. The warmth should be sufficient to repel frost.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would oblige delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPOINTMENTS FOR FEBRUARY.

MONDAY, FEBRUARY 5—
National Chrysanthemum Soc.'s Annual meet. at Cafe Restaurant, Strand, at 6 p.m.

WEDNESDAY, FEBRUARY 7—
Roy. Scottish Arboricultural Soc.'s annual meet.

FRIDAY, FEBRUARY 9—
Roy. Gardeners' Orphan Fund Annual meet. and Election of Candidates at Simpson's, Strand, at 3 p.m.

TUESDAY, FEBRUARY 13—
Roy. Hort. Soc.'s Coms. meet. Annual meeting of Fellows at 3 p.m.

THURSDAY, FEBRUARY 15—
Manchester Orchid Soc.'s meet.

TUESDAY, FEBRUARY 27—
Roy. Hort. Soc.'s Coms. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 39.4°.

VITAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, February 1 (8.0 a.m.): Bar, 29.5", temp. 35.5". Weather, Snow.

SALES FOR THE ENSUING WEEK.

MONDAY AND TUESDAY—
Clearance Sale of Nursery Stock at the Cannon Nursery, Richmond, by Protheroe and Morris at 12 o'clock.

WEDNESDAY—
Bulbs, Herbaceous Plants, Fruit Trees, Japanese Lilies, &c., at Protheroe and Morris's Rooms, 67 and 68, Chancery, at 12 and 3 o'clock.

WEDNESDAY AND THURSDAY—
Sale of Nursery Stock at Woodlands Nursery, Maresfield, at Protheroe and Morris's Rooms, at 12 o'clock.

THURSDAY—
Sale of Roses, at Protheroe and Morris's Rooms, at 1 o'clock.

FRIDAY—
Sale of Fruit Trees, Roses, Herbaceous Plants, &c., at Protheroe and Morris's Rooms, at 12 o'clock.

SATURDAY—
Sale of Nursery Stock, Greenhouses, &c., at Bionley Road, Shottlands, by Protheroe and Morris, at 12 o'clock.

Sports from Root Cuttings.

A year or two ago, in the course of a lecture before the Horticultural Club, Mr. C. E. Pearson drew attention to the fact that certain plants—some Bouvardias and Regal Pelargoniums—do not come true when propagated by means of root cuttings. Thus, among Bouvardias Mr. Pearson has records of root-cuttings of double-flowered plants of the varieties Alfred Neuner, President Garfield and Hogarth, producing single-flowered plants. These interesting facts have been investigated recently* by Professor Bateson, who has succeeded in both confirming and elucidating them.

He finds that the root-cuttings obtained from the Bouvardia Bridesmaid give flowers of a kind distinctly different from those of this variety and identical with

those of another variety, namely, Hogarth. The flowers of Bridesmaid are pink on the outer surface of the corolla and pinkish white on the inner surface, whereas the corolla of the sport is, like that of Hogarth, carnation-scarlet.

Now, it is well known that when a bud forms on a root-cutting it originates in a way different from that in which a bud arises on a stem. The bud of a stem is formed of the more superficial tissues—the epidermis and outer cortical layers—but a bud on a root originates from the deep layers and pushes its way to the surface through the cortical layers.

Hence it follows that the deeper tissues of the root of Bridesmaid from which the bud of the root-cutting arises do not possess the factor for producing the Bridesmaid colour, but only that which gives rise to the deep colour of Hogarth. Hence Bridesmaid is to be regarded as having a "skin" carrying one kind of colour factor and a "core" carrying colour factors of another kind, or, at all events, lacking the pale colour factor which imparts to normal Bridesmaids their proper blush.

Thus the phenomena presented by the sporting root-cuttings of this Bouvardia are brought into line with those exhibited by other natural and "artificial" "sports." Readers of this journal will remember (see *Gard. Chron.*, Sept. 2, 1911, p. 161, *et seq.*) the remarkable discovery made by Winkler and Baur of the nature of the plants obtained by grafting together *Tomato* and *Solanum nigrum*. Some of the plants produced in this way had a skin of *Tomato* on a core of *Nightshade*. Others had the outer tissues of *Nightshade* and the inner of *Tomato*. To these the name of Chimaeras was given, because of their monstrously dual nature; and because the layers belonging to the one plant fit over the core belonging to the other, they are known as periclinal Chimaeras. To keep a mental picture of them we may think of them as finger and glove Chimaeras.

Similar monstrous combinations of layers of different plants in one individual explain the wonderful behaviour of *Cytisus Adami* and the various other "graft hybrids," such as the *Bronvaux Medlars*. In *Cytisus Adami* the skin of *C. purpureus* covers the core of *C. Laburnum*, and in the *Bronvaux Medlars* the "glove" is *Crataegus mespilus* and the "finger" is *C. monogyna*.

Questions of great scientific interest are raised, but only in part answered, by these interesting observations of Prof. Bateson. One of the chief of these questions is, How comes it that the cells of the core of Bridesmaid carry factors different from those carried by the surface layers? Both superficial and deep cells arose by cell division from the single egg cell of the embryo. Those factors—at all events the flower colour-producing factors—would appear not to be distributed uniformly throughout all the cells of the plant, but to be distributed in such a way that some go only to the surface cells and not to the deep-lying cells. This, however, is a subject which, though

fundamentally important to the student of heredity, only remotely concerns the gardener. The facts, on the other hand, are interesting alike to gardeners and men of science, for they appear to settle once for all the much discussed and disputed question of the nature of graft-hybrids, and to show that the strange case of Dr. Jekyll and Mr. Hyde is almost a commonplace among plants.

RHODODENDRON MRS. STIRLING.—As a garden variety this beautiful pink-flowered *Rhododendron* occupies a very high position. It is true that the flowers are not so large as those of the Pink Pearl type, but the trusses are larger, and their very profusion almost hides the foliage. Another good quality of the variety is its vigorous growth, the tree making a large specimen in congenial soils. It is suitable for massing in large beds, and visitors to Kew may remember the fine effect in summer of massed plants of Mrs. Stirling in the Broad Walk. It was raised by Messrs. JOHN WATERER, SOSS AND CRISP, who exhibited magnificent specimens at the R.H.S. Chelsea Exhibition last year; it obtained the R.H.S. Award of Merit in May, 1906.

WAR HORTICULTURAL RELIEF FUND.—The Ladies' Committee of the War Horticultural Relief Fund has arranged for a series of lectures to be delivered in London on Thursday afternoons, at 3 p.m., during the coming season. Admission will be by ticket, which may be obtained from the members of the Entertainments Sub-Committee, or from the Secretary, R.H.S., Vincent Square, Westminster, S.W. The dates arranged so far are: February 8, The Hon. JOHN FORBESSTE, M.V.O., on "Wellington"; February 22, Sir OWEN SEAMAN, on "Parody"; March 1, Mr. JOHN BAILEY, on "Don Quixote"; March 29, Mr. STEPHEN GRAHAM, on "Russian Gardens and Wild Nature."

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual general meeting of the National Chrysanthemum Society will be held at Carr's Restaurant, 264, Strand, on Monday next, at 6 p.m.

APPOINTMENTS.—Mr. F. A. STOCKDALE, Director of Agriculture, Mauritius, has been appointed by the Secretary of State for the Colonies Director of Agriculture, Ceylon, and Dr. H. A. TEMpany, Government Chemist and Superintendent of Agriculture for the Leeward Islands, has been appointed to succeed Mr. F. A. STOCKDALE as Director of Agriculture, Mauritius.

THE DOUGLAS FIR IN CHALKY SOIL.—Analyses of soil in several situations in which the Douglas Fir is growing well demonstrates that, contrary to general opinion, this tree is tolerant of chalk even when the percentage of that substance present in the soil is very high. From his investigations Professor SOMERVILLE concludes that the Douglas Fir may be planted with confidence on soils overlying chalk, provided that the top 12 inches are thoroughly disintegrated, and especially if a previous crop of hardwoods or underwood has left the surface rich in humus.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY.—The sixty-fourth annual business meeting of the Royal Scottish Arboricultural Society will be held in the Goad Hall, 5, St. Andrew Square, Edinburgh, on Wednesday next, at 12.45 p.m. Mr. SCHEER, F.R.S., of the Board of Agriculture for Scotland, will represent the Board at the Meeting, and Colonel McDONALD, director of the timber operations of the Canadian Overseas (Forestry)

* "Root Cuttings, Chimaeras and Sports," *Journal of Gen. Genet.*, Vol. VI, No. 2, December, 1916.

* "Relationship of the Douglas Fir to Lime in Soil," by Prof. Somerville, *Quarterly Journal of Forestry*, XI, 1, Jan., 1917.

Corps, has accepted the Council's invitation to be present. A discussion on our afforestation problems will be opened by Dr. BORTHWICK.

ROYAL GARDENERS' ORPHAN FUND.—The annual general meeting of the subscribers to this fund will be held at "Stapton's," Strand, on Friday next, the 9th inst., for the purpose of receiving the report of the committee and statement of accounts for the past year; to elect officers for the ensuing year; to authorize the secretary to suspend the publication of an annual statement of the names of subscribers and the amount of their subscriptions (as provided for in Rule 8) until further order; to elect sixteen children to the benefit of the fund; and to transact such other business as may arise. The chair will be taken by Mr. H. B. MAY at 3 p.m.

FLOWERS IN SEASON.—From Messrs. STUART LOW AND CO. we have received blooms of their new Carnations Red Ensign, a large variety of reddish-carmine colour; Countess of Wilton, a neat bloom of moderate size with petals of vinous-crimson colour; and Eileen, a shapely bloom of salmon-pink colour.

MR. C. T. DRUERY, V.M.H.—Readers of the *Gardeners' Chronicle* will hear with deepest regret that Mr. CHARLES T. DRUERY, who is in his 74th year, is entirely incapacitated by an affection of the heart that prevents him from leaving the house. Mr. DRUERY'S love for Ferns, and his labours to popularise the British species and varieties are well known, not only by his editorship of the *British Fern Gazette*, and his excellent *Book of British Ferns*, but also by the articles he has contributed to our own columns and those of our contemporaries. In the unfortunate circumstances that have overtaken Mr. DRUERY many of his friends see an opportunity to express in a practical manner their appreciation of the work he has done, and it has been determined to ask his acceptance of a presentation. Mr. W. B. CRANFIELD, East Lodge, Egham Chase, Middlessex, who has the matter in hand, will be glad to hear from all interested in the movement.

RETAIL PRICES OF SEED POTATOS. Mr. CHARLES E. PEARSON, secretary of the Horticultural Trade Association, asks us to state that most seedsmen had contracted or bought, and in most cases obtained delivery of, their season's supply of seed Potatos at prices which are in some cases more than 50 per cent. higher than the maximum figure recently reported in the Press, weeks or months before the question of the limitation of prices of seed Potatos was mooted. It will, therefore, states our correspondent, be impossible for these seed Potatos to be sold retail at anything less than the price already printed in the catalogues. The public should distinguish between seed Potatos offered by the leading seedsmen, which have been carefully cultivated for the purpose, and kept true to name, and the ordinary farm stocks grown with out special care and often very much mixed.

MR. HUGH F. MACMILLAN.—Amongst the passengers who left Liverpool on Thursday last were Mr. and Mrs. H. F. MACMILLAN, who are returning to Ceylon. Mr. MACMILLAN is now quite recovered from his recent operation, and on reaching Ceylon will resume his duties as Curator of Botanic Gardens.

WARM WATER FOR SPRAYING FRUIT.—Experiments in the use of warm water as a spray for destroying insect and fungus pests on fruit appear to have given satisfactory results. Warm water was sprayed on Grapes with no ill effects to the fruit, and the treated Grapes, enclosed immediately afterwards in bags, were found when ripe to be free from damage, whereas others, untreated and bagged at the same time, were found to be seriously damaged and disfigured. The warm-water spray was also tried on espalier Pears (Doyenné d'Etiver), the

leaves of which were badly attacked by a fungus (apothium). The fruits lagged after spraying remained perfectly clean. In the case of the vine the temperature found to be sufficient is 65° C. (150° F. in the tank of the spraying machine and 65° C. (154° F. as it issues from the nozzle). With Pears a higher temperature, 70° C. (156° F. in the tank and 66° C. (150° F. as it issues from the nozzle).

LUPINS AS POISONOUS PLANTS.—Lupins have played a part in European agriculture from the earliest times. Their use as a green manure

been much tried. Lupins contain specific alkaloids—among them being the substances mentioned above. The author has been divided as to whether or not the poisonous effects so frequently produced by Lupins are due to sheep and cattle poisoning by the so-called lupanine. The authors of the British Catalogue review have shown, however, that it is the alkaloid which is the toxic substance. They have, moreover, that animals may eat considerable quantities of Lupins without suffering ill effects, but that if the consumption pass a certain limit acute poison-

FIG. 19. RHODODENDRUMS. SEVERAL FLOWERS BRIGHT CLEAR PINK (See p. 50).

is described by Pliny, and Lupin meal was in common use among the poorer Greeks and Romans. The poisonous properties of Lupins were recognised, and precautions were taken before making Lupin meal to remove them. In modern times poisoning of stock by Lupins has often been recorded, and in some cases, for example, in Persia in 1830 the loss of sheep from this cause was widespread, amounting to nearly 6 per cent. of the flocks. Although it has long

ing results. Hence, with proper precautions, Lupins may be used as fodder with but little risk. The poison has, moreover, no cumulative effect. Of species demonstrated to be poisonous, the authors mention Lupinus albus, L. angustifolius (European species), L. leuropsis and L. luteophilus. L. luteus is much less toxic. Remedies are difficult of application, for the reason that the dose which is harmless is but little less than that which is fatal; but the authors suggest that sodium bicarbonate administered at frequent intervals may assist recovery. The seeds are most, the pods less, and the leaves least toxic.

* *Lupinus as Poisonous Plants.* By Messrs. C. D. Marsh, A. B. Clawson, and Halleigh Marsh. Bull. 408, U.S.A. Dept. of Agr.

Inasmuch as the poison is easily leached out by water, there is no danger to be apprehended from cooked Lupin seeds.

PLANT DISEASES IN QUEENSLAND. The Minister for Agriculture in Queensland, by the introduction of a new Diseases in Plants Bill, purposes taking stringent precautions with respect to the introduction and eradication of diseases affecting vegetation. The measure provides for the registration of orchards on or before March 31 of each year. Registration fees in the case of a Pineapple or Banana plantation, or vineyard, are 1s. per acre; in other cases, 2s. 6d. for every hundred trees or part thereof growing in such orchard. Nurserymen must also register their nurseries, and pay an annual registration fee of £2 in the case of a nursery not exceeding five acres, and £5 in the case of larger ones. Failure to comply with these provisions will render the occupier or owner liable to a fine of £5 for the first offence, and £10 for any subsequent offence. Every insect, fungus, tree, plant and vegetable introduced into Queensland, or removed out of any orchard or nursery, and every diseased tree, plant and vegetable introduced into the State; and every box, package, basket, or case harbouring any such insect, fungus, tree, plant or vegetable may forthwith be seized by an inspector, and dealt with as the Minister or inspector may direct. The owner or occupier of an orchard or nursery may be ordered to eradicate a disease at his own expense. If, however, an owner's property be destroyed in the eradication of the pest, compensation will be paid.

DOINGS OF LOCAL SOCIETIES.—At the annual meeting of the Lewisham Horticultural Society held recently it was announced that most of the 865 members were allotment holders. Since November 30 the Society has taken 16½ acres of additional land for cultivation, and the committee has in view another 30 or 40 acres for the members.

—The Croydon and District Horticultural Society has arranged a series of five lectures on vegetable cultivation. The lectures are being given each Friday evening in the Croydon Public Libraries.

—The Birmingham and Midland Counties Gardeners' Society has arranged a series of lectures for allotment holders and others interested in food production. Addresses will be given by gardeners and others on such subjects as Potatoes, the rotation of crops, allotment gardens, seed sowing, and diseases of vegetables.

—Lectures on gardening are being delivered by Mr. CYRIL HARDING in the Finchley District, where the allotments number as many as 1,000.

—Mr. B. A. GAGE has been engaged by the Bristol Education Committee to deliver a series of ten lectures to allotment holders.

—The Finchley Chrysanthemum Society has given £10 to the local War Relief Fund. The members have decided to hold two shows in 1917 with the special purpose of encouraging the growing of fruits and vegetables.

—The Royal Horticultural Society of Ireland has abandoned its spring show this year, but is making arrangements for an exhibition in August.

—Lidget Green Horticultural Society is encouraging the growing of vegetables by the members and others. A lecture on vegetables was delivered recently by Mr. G. DENSMORE, President of the Bradford Paxton Society.

—The East Oxford Horticultural Society has decided to hold an exhibition as usual this year, on Thursday, August 23. Last year's balance-sheet showed a profit of £29 18s.

—The University Extension Board of the University of London has arranged short courses of weekly lectures on garden cultivation and

how soils should be treated to secure large crops, by Mr. F. J. CHITTENDEN. The arrangements so far include one course in central London in the School of Arts and Crafts, Southampton Row, on Tuesdays at 6.15 p.m., beginning February 6, and another at the Ealing Technical Institute on Thursday evenings at 8 o'clock, beginning February 8.

—Out of a total income for 1916 of £69 13s., the Freshwater Horticultural Society has resolved to give all the profits, with the exception of £10 as a balance, to the D.C.L.I. Prisoners of War and Red Cross Funds.

—The Inverness Town Council has decided to plough about half of the public park and to sow it with oats.

PLANT NOTES.

CYCLAMEN.

THERE exists a very marked difference of opinion regarding the proper stage and the exact time for repotting old Cyclamen plants. It seems to be one of those differences which on the whole does not much affect the ultimate result—the quantity and quality of the flowers in winter and spring. I have been very successful with plants which had only a brief rest—just long enough to dry the soil—when they were repotted, with all the old leaves intact. Plants have done equally well when rested for a longer period, but not so long as some growers recommend. My observation tends to show that the Cyclamen needs a long season of growth to secure the best results, and if that is correct, then the longer the repotting of the plant is delayed, the greater the risk of failure, partial or complete. It is quite noticeable this year that plants which were shaken out and repotted with leaves on are superior to those which were kept till the foliage had gone, though the other treatment was similar. A number of young plants never got beyond 4-inch pots last summer, and these I hope to repot in 6-inch pots in spring, without disturbing the roots in any way. Those already in 6-inch or larger pots are usually the better for having a portion of the old soil removed. It does the plant no harm after a brief rest, and enables one to produce an equally good plant in a smaller pot. At one time I grew Cyclamens in cold frames during the spring and summer, but in these parts (E. Lothian) much more satisfactory results are obtained by growing the young plants in a stove temperature, while old plants pass the summer on a stage partially shaded by the foliage of Grape vines. When speaking in a comparative sense—growth is completed, plants of all ages do very well for a couple of months in a cold pit, giving them a little heat during the winter months, with the occasional aid of a stimulant to increase the size and brilliancy of the flowers. A source of danger to the plants arises from the assistant, when administering water, failing to allow for the corms taking up space not occupied by those of other plants, and so limiting the supply of water to an injurious extent. Large corms in 7 or 8-inch pots should therefore have the space available for water filled at least twice, and sometimes thrice, when water is required. *E. P. B. East Lothian, N.B.*

BRUGMANIA ARBOREA.

The beautiful flowering shrub, *Brugmansia arborea*, does not resent severe pruning, and can be kept in the desired shape and dimensions for the greenhouse by cutting back annually the spent flowering wood.

It flowers best in a restricted border made up of rich loam, with enough broken bricks or lime-rubble to ensure porosity, and once the roots take possession of the soil artificial manure can be used to advantage as a top-dressing in spring.

During the growing season moisture should be liberally supplied to the roots, but withheld in

winter. The latter is the proper time to prune, after which the stem and branches should be washed with insecticide to destroy any vermin lurking in the crevices of the bark.

B. arborea comes into flower about midsummer, and continues to produce an abundance of lovely white flowers well into the autumn. *M. M. Peck.*

VERONICA LA SEDUISANTE.

The varieties and hybrids of *Veronica speciosa* are usually regarded as tender and requiring the protection of a greenhouse, but *V. La Séduisante* has been flowering on the rockery at Holland House, Kensington, for some years. Usually it commences to bloom rather late in summer, and continues till severe weather stops growth, and last year this was well into December. The flower-spikes are moderate in length, as they are in all plants closely related to *V. speciosa*. The foliage throughout the summer is tinted with purple, and the under surface retains the hue till well into winter. This, coupled with the intense crimson-purple of the flowers and evergreen foliage, makes the shrub a highly ornamental one. The soil at Holland House is heavy and much inclined to clay, which would indicate that this and similar Veronicas are hardier than they are generally supposed to be. Quite a number of strong bushes line a ridge, fully exposed, on a part of the rockery. The variety was accorded an Award of Merit by the Royal Horticultural Society in July, 1897. *J. F.*

CONFESSIONS OF A NOVICE.—XIII.

In the intervals—and they were frequent and long—between spells of double digging, I have been exercising my brain and resting my back in trying to discover the precise and specific meaning of the terms commonly used to describe the different ways of digging. The terms which have been intriguing me are the familiar ones—trenching, bastard trenching and double digging. If I take out three spits, wheeling the first two from the trench to the "opposite end," as well as the top spit from the second trench, and if, having turned over spit 5 and thrown spit 2 from trench No. 2 on top of it and then, by yet more herculean labours, hurled the top spit of No. 3 trench a full yard, so that it—or some of it—reaches and covers trench 1—have I trenched my ground? My garden? world, I am well aware, answer emphatically, No! For he would claim, not without a solid foundation of truth, that he had done it. This, however, is quibbling. I admit that he performed most of the work, but, on the other hand, I became far more tired than he did. What I wish to ask is, whether trenching is a term that denotes depth, or does it connote the disturbance of the order of the several spits? Must I, in order to trench, bring spit No. 5 to the surface? It is only on behalf of terminological exactitude that I ask, for my gardener would no more allow me to bring to the surface the yellow, irony sand which lies beneath the painfully acquired loam of my garden than he would entrust me with ventilation of the frames or the pruning of my fruit trees. I do these good things by stealth, and in consequence gloom pervades the garden on Monday mornings. If trenching is only a measure of profundity—three spits deep—what is the name for trenching with inversion of the order of the spits? In other words, must we use the same word to describe the labours of Mr. Molyneux and those of Mr. Beckett? If not, which is trenching and which is the other?

I admit that in double-digging I am less out of my depth, but, nevertheless, there are difficulties even there. Is bastard trenching the same as double-digging, and is it double-digging when I merely poke about the second spit with a pronged fork, when I turn over the second

spit, or when I bury the top spit and bring the second to the surface?

Owing to my assiduity in digging up my lawn for Potatos I have gained a high reputation for patriotism, and admiring neighbours dropped in in relays on Boxing Day to watch, encourage and criticise. I have in consequence become—except among the real professional gardeners, who know better how to appraise my novitices—a horticultural Sir Oracle. I dared not confess that it was the temporary success which the lawn had gained over our efforts to subdue its grossness that weighed with me in digging the turf in and in turning it under for Potatos. Only when one of my neighbours—whom I wish to retain as a friend and whose grass is perfect—announced his determination to make like sacrifice of his croquet lawn did I confess to him that Plantains were no less responsible than patriotism for my turning my tennis racquet into a ploughshare. Nevertheless I am constantly appealed to as an authority on gardening, and so long as my questioners keep to problems of artificial manures I can—fortified by a recollection of university lectures in chemistry—come out of the ordeal without fatal loss of prestige, but when lawyers and keen business men pin me down to say what exactly trenching—legitimate and bastard—and double-digging are, I confess that—like the paths of the garden—I am gravelled. So far as I can compute, there are seven different operations which may be performed in digging a piece of ground from one to three spits deep. They are—3 spits dug and replaced in due order, 5 spits dug and the order reversed, 5 spits dug and the order made to run from below upwards, 7, 1, 2 (of course mathematicians could find other permutations beside these), 2 spits dug and the order maintained, 2 dug and the order reversed, one dug and second only broken, and 1 dug. Which is the name of which of these operations is as hard for me to understand as it was for the listener to solve the numerical conundrum of "We are Seven." I have learned so much from digging, the wonderful skill, address and economy of labour practised by the skilled man, the clumsy, laborious ineffectiveness of a willing and back-broken amateur, the extraordinary vitality of plants, enabling them to exist on a revealed in the turned-up soil, on a mere veneer of soil; and so, to round off this part of my education, I venture to ask for enlightenment as to the proper terms to apply to the four mentioned ways of treating soil. If, as I suspect, there are not enough terms to go round, nobody will be more pleased than I, for my grudge against Botany is Buffon's or Lamarck's—I forget which—"I forget which—"It is easier to learn the science than it is to master the nomenclature," and I would not have this become true of horticulture, even though they are beginning to teach it in universities. J. N.

BERBERIS SUBCAULIALATA.

AMONGST the recently introduced Berberries are some first-class garden shrubs, notably *Berberis Wilsonae*, *B. rubrostilla*, *B. Sargentiana*, *B. polyantha*, and the closely allied *B. subcaulialata*, of which a fruiting branch is illustrated in fig. 20. The last named has rounder berries than those of *B. polyantha*, and they are of a coral-red colour. The habit, too, is rather more elegant, and when seen side by side it is apparent that the species under notice is the better garden plant. The species is not common in gardens yet, but it will doubtless be grown extensively as it becomes more easy to obtain. There is a very large collection of these new Chinese Berberries at Aldenham, where *B. subcaulialata* has been selected as a companion to the Cedars in the avenue by the moats. The *Berberis* is set in rows, and

the plants are like pyramids in the grass compared to the Cedars, yet the branches, studded with golden flowers, and later with coral-red berries, serve to enliven and relieve the effect of their more sombre neighbours.

POTATOS AND PREJUDICE.

WITH all the attention which has sprung up around the Potato it is remarkable how little is known of its introduction. Historians, it has been said, finding that history does not repeat itself, have maintained the fable by repeating one another. To those who sumner in the byways of horticultural history there seems some truth in this. Raleigh, we were told at school, introduced the Potato from Catalina, but Raleigh never was at Catalina, nor does the Potato grow wild there, being a native of Peru, where it was found by Pedro Cieza de Leon about 1532. This Spanish traveller discovered Pizarro, whose conquest of Peru thus

is a fact of some 200 years that followed the victory of Waterloo.

Even then it did not lack detractors. Cobbett thundered against the "potantions" vegetable, which, with the use of tea, would reduce the sturdy English labourer to the level of the Irish peasant. The *Times*, in 1829, considered it as "a fit esculent to lower the food of the opulent," but its use among the working classes would lower them to "a nation of miserable, turbulent drunkards." In France it was considered "le plus mauvais de tous les légumes dans l'opinion générale." Cependant le peuple qui est la partie la plus nombreuse de l'humanité, s'en nourrit." This was written before 1879!

Parmentier, whose name still figures on our menus when Potato soup requires disguising, succeeded in introducing it to higher circles, and even persuaded Louis XVI to wear its flower in his buttonhole.

In Scotland the death of 1740 led to its introduction, and here, again, it met with the usual opposition. "Tatties, tatties," said one old native, "I ne'er sapped on them a' my days and winna' the night." The more philosophical

FIG. 20.—BERBERIS SUBCAULIALATA, A NEW CHINESE SPECIES WITH CORAL PINK BERRIES.

inquiry led to the introduction of the Potato into Europe. Its welcome in Spain was not warm, for long it was but a curiosity, and it is said, with what truth we dare not say, that the Church frowned upon it, seeing in it a competitor with the titiable wheat. In Italy its reception was hardly less cold, and as a food-plant its spread on the Continent was everywhere slow.

Its introduction into Ireland is said by many writers to be due to Hawkins, and if this be established, it seems probable that it was seized on one of the Spanish prizes. It soon became widely grown there, and spread thence to Leicestershire, the first part of England to undertake its culture on a large scale.

In England it did not lack supporters, and in 1665 the Royal Society listened to Mr. Buckland, who spoke long and warmly in its praise. How far this championship succeeded is doubtful. One witness tells us it was common in England in 1695, but a dozen contemporaries give him the lie. The Potato of Falstaff, it should be said, refers to a different plant altogether, a member of the *Convolvulus* family, whose edible tubers were grown and used, when candied, as a sweetmeat. The general trend of evidence is that the Potato did not come into anything like general

argued that Potatos were not mentioned in the Bible. However, the "tatties" made them selves at home, and have kept many a Scotchman from treading the "broad road that leads to England."

It is not perhaps difficult to understand some of the reasons which hindered the adoption of the Potato. Its resemblance to other members of the Solanum family, which are poisonous, and its insipid taste, were no small grounds for mistrust. Potatos are now a habit, but if we were to meet them for the first time should we give them an enthusiastic welcome? B.

THE ROSARY.

ROSE TRIER.

THIS variety of the multiflora scandens section is remarkable for its freedom and continuity of flower and its delightful fragrance. Commencing to flower in June, it continues into the autumn, finishing with a crop of hips. In colour the buds are pink, opening cream and developing paler with yellow anthers. It grows 6 feet, and forms a wide spreading bush. Where space can be given it requires but little pruning beyond

this removal of weakly growths from the centre of the bush.

ROSE AUGUSTUS HARTMANN

Those who are seeking a brilliantly coloured Rose, and one that will give plenty of well-formed blooms, should plant Augustus Hartmann. The growth is all that could be desired, with ample leafage, that is not subjected to attacks of mildew. The shapely blooms are borne freely on stiff, erect stems. The colour, cherry-red, is most striking. It is a good Rose for use as cut blooms, small buds developing into large blooms, which last a long time fresh.

ROSE LADY PLYMOUTH.

CUT blooms of this Rose deepen in colour as they develop in water, the pale creamy tint assuming a pleasing tinge of yellow. In the open this variety has all the characteristics of a good Rose. E. M.

FOREIGN CORRESPONDENCE.

THE PLANTING OF BEARDED IRISES.

MY experience and observation in regard to the planting of bearded Iris may be of interest to your readers as confirming Mr. Dykes' deductions rather than those of Mr. E. H. Jenkins.

Our climate is so much more severe than yours that nothing could be moved in March, perhaps not in April, in my garden, but it does not make much difference except to shorten the blooming time of the Pogonises, and affects the root growth, I imagine, in the same way.

During the first half of July, when I lift and divide Irises, I find them almost without roots; the old ones are shrivelled and dead, but holding the rhizome in place, and the new ones, just pushing out from the rhizome, are thick ($\frac{1}{2}$ -inch or more throughout, with a blunt end), and unbranched until full grown. It is not until well into September that you find the root system fully developed with a mass of fine branching root fibres as well.

The roots, if destroyed, are not renewed to any large extent until the next blooming season is past.

The buds for the coming season are formed before winter, usually one stalk to each sheaf of leaves, though some varieties have more, and my theory is that the March-planted ones in the table published in *Gard. Chron.*, December 2, 1916, are really one year ahead of the others; i.e., you have lost all but six of the blooms formed in 1912 from the March transplants, while you had bloom on the June ones before transplanting. Thus the March plants skipped one year's bloom, and naturally, with three months more of active growth in the new position the 1915 clump is larger, and you find more bloom to the March transplant's credit, but a lower average increase.

Irises can be shifted without a noticeable check if the work is done care-fully in one's own garden at almost any time, but where you divide them it is important to let them ripen and the old roots die off. This takes from four to six weeks after they blossom. When rhizomes are purchased and the roots cut off, the result is different. I had a curious example of this in the behaviour of a variety called Loreley. I had seen the table of the Wisley 1913 experiment last winter, and so purchased several hundred in March to compare with other plantings, and among them twenty-five of Loreley. They came and were planted in April. I never saw finer rhizomes, and although they were slow to start they grew wonderfully, but in August I noticed a flower or two close down in the leaves, and on examination I found every plant had, or had had, blossoms, but without stems long or strong enough to push them out of the clasping leaves, and, with the exception of those two or three, the flowers had died, and the whole mass inside of the leaves was rotten. In removing it I had to cut off most of the growth on the end of the rhizome, which could not be beneficial.

In the plot where I propagate my hybrids I had this year, much to my surprise, a sheet of bloom, five out of six of the plants having one or more flower-stalks, although the previous July I had broken up the rhizomes in as small natural divisions as possible. The bloom on the named varieties planted in September, 1915, had only scattered bloom, and the April, 1916, planting no bloom (until August, and then abnormal, as previously stated).

I look eagerly for the coming of the *Gardener's Chronicle* in the hope of finding a note on Iris, as I often do, and I am glad you do not restrict them to April and July; those may be the proper months (and better than that never), but they are such busy ones for the Iris grower that there is not much leisure for reading *Grove Street*, *Glen Road Iris Gardens*, *Wellesley Farms, Mass., U.S.A.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

BROWN ROT DISEASE OF FRUIT TREES.

The brown rot diseases of fruit trees often cause serious losses to fruit growers. The subject is now under investigation by the Research Department of Wye College, with a view of studying the various forms of the fungus concerned, and of devising the best methods of controlling the disease. We desire the co-operation of fruit growers in this matter, and would be glad if readers would give us an account of their experience of the disease by supplying answers to the following questions, which relate to the form of "brown rot" that produces "blossom wilt" and "canker" of Apple trees. 1. Are any of your Apple trees affected with a disease which causes the trusses of blossom, with the accompanying leaves, to "wilt" and finally to become brown and withered? 2. What varieties are attacked? 3. When did you first notice the disease? 4. Do you believe it to be getting worse year by year? 5. Can you supply an estimate of the damage done to your Apple trees by this "blossom wilt" disease, either on the crop as a whole or on particular varieties? E. S. *Sullivan*, *South Eastern Agricultural College, Wye, Kent.*

METHODS OF TRENCHING—It is a matter of some surprise to note that gardeners when undertaking trenching still indulge in the old-fashioned, laborious way advocated on p. 23, viz., "To mark out a trench 2 feet wide and wheel the whole of this soil to a depth of 2 feet to the opposite end of the plot." In a quarter of, say, 40 feet to 60 feet wide, the soil bulk to be removed would be considerable, requiring much time and labour, these latter increasing proportionately with the length of the plot. Many years ago, when breaking up an old pasture for the cultivation of Narcissi and other hardy plants, I hit upon a modification of the above old-fashioned method, and incidentally saved considerably thereby. The idea is simplicity itself, and is as follows: Running a line lengthwise through the centre of the plot, a cable was cut to assist straightforward work, and in order that instead of trenching the quarter its full width right away, the work could be done by forward and return halves. In opening the trench of the first, or "forward" half, the soil was turned over on to adjacent ground or path, the trench and-a-half system of opening being followed for obvious reasons. Reaching the other end of the "forward" half of the plot its trench was made good with the soil created by the opening of the trench of the "return" half, the material for the filling in of which was already in waiting at the opposite extreme—the starting point—of the quarter. In this way not only was the wheeling of a considerable bulk of soil from one end of the quarter to the other entirely dispensed with, but the need for the initial excavation of the soil from one half of the quarter—the final trench of the return half—did not arise. E. H. *Jenkins.*

ECONOMICAL POT-WASHING.—Pot washing tanks to-day, as it ever has done, among the most usual of a gardener's duties, reserved generally for wet and frosty days, and for the least skilful of the gardening staff. I moved at any time, it is particularly so in times of frost, unless heated potting shed or convenience in boiler shed exists for the work. For a considerable number of years, however, pot-washing by hand was entirely dispensed with by the writer. It was done just as effectually, and far more cheaply, by the elements. The finishing of crops of Chrysanthemums or Carnations always released a few thousand pots, and these, freed of soil, were taken direct to the then vacant standing ground and arranged close together. A few weeks thus exposed to the weather wrought a great change, the interiors being usually as clean as if thoroughly scrubbed. Inverting the batch, the exteriors were exposed, with similar cleansing results, frost playing a most important part in freeing them from moss or vegetable accumulations of any kind. In this way thousands of pots were cleansed at practically no cost, and the cleansing was even more thorough and complete than ordinary washing. In addition, I consider the pots are appreciably hardened by the exposure, while materially sweetened—disinfected if you will—by the action of the frost. In any case it is worthy of general adoption as a time-saver alone. I got the idea originally from observing the cleanliness of the exposed portions of the pots in the stacks. Doubtless other plant growers were similarly impressed, since for some years now it has been practised by market growers large and small. H.

OLD SEED AND PLANT CATALOGUES (see pp. 9, 29).—In the notes on the above by H. H. C., reference is made to Messrs. Rollinson's of Totting, and the fact that he failed to locate the site of that once famous nursery when last in the neighbourhood. Should he be in the locality again, and desire to do so, he has but to step out 80 yards or so in the direction of London from the monumental mason's still at the corner of "Totterdown," to bring him (approximately) opposite the iron gates which constituted the main entrance. Thirty-five yards more and your correspondent would be practically opposite the entrance to the big conservatory, another 30 yards bringing him to the yard entrance and offices. The Garratt Lane side—the fruit tree department—a portion of which was opposite Parker's nursery, also now covered with bricks and mortar, is readily fixed by the "Fountain Inn" at the corner of Cemetery Road, provided that name is still perpetuated. Reference is also made to Rollison's Telegraph Cucumber, "its advent" and its "raiser." I was not aware, however, that the latter was ever known. Messrs. Rollison obtained it from a private gardener, who himself distinctly told me at the time he was unaware of its origin. It had been given to him, he said, and so many years before, that he had quite forgotten by whom or where it came from. The gardener was at the time old and tottering, and of a type that always went to work in a "top-hat" of the "beaver" pattern. At and prior to the advent of Rollison's Telegraph Cucumber, I was herculean plant foreman for the firm, and well remember the first batches grown for seed before the variety was sent out. E.

"ONCE-GROWN" POTATO SEED.—The pronouncement of the Board of Agriculture and Fisheries in Leaflet No. 63 on this subject certainly stands in need of qualifying. In Southern districts, where the air and soil are generally dry in summer, it may be correct that Potato seed from Scotland yields the heaviest crop the first year and that there is a marked falling off in each succeeding year if home-saved seed from the Scottish stock is used. But in some other Southern districts, where the rainfall varies from 35 inches to 50 inches in a year, this statement does not hold good, in all cases at any rate. I have known very satisfactory crops of Potatoes grown in South Buckinghamshire, Middlesex, Surrey and Berkshire from home-saved seed to the third generation from Scottish and from Lincoln seed. But my most contrary experience was at Pinnerow, in Cornwall, where during twelve years I invariably failed to obtain even

moderate crops the first year from Scottish and from Lincoln seed, although the sets were sown and planted at the proper times for each variety. The new tubers were always small, approximately of seed size, and the crops distinctly "under." But these "one grown" varieties during the next two years were eminently satisfactory. There was a slight falling off in crop and quality in the third year, after which time the tubers would become mixed, pebble shaped and round, though all from kidney-shaped sorts, to from some reasons which I could never discover, the soil or climate, or maybe both, would not produce a good quality round or pebble shaped Potatoes, while many kidney shaped sorts were first-rate when cooked. This was distinctly unfortunate, because generally the "rounds" produce the heavier crops, but, like the de-zerter kidneys, when cooked were close and starchy. The vegetable ground at Penarth slopes to the north-west, the soil is a light, deeply-worked loam, rather under average quality, and the rainfall heavy. J. C. Bartlett

STANDARD RED, WHITE, AND BLACK CURRANTS.—I was greatly impressed by the excellent examples of these small fruits that I saw in the well cultivated fruit and kitchen gardens at Worsley Hall, near Manchester, the residence of the Earl of Ellesmere. Mr. Upjohn, the gardener, pointed them out with much gratification. The stems were about 5 feet tall, and they were carrying large heads that were bearing heavy crops of fruit. Mr. Upjohn informed me that the bunches kept much better than those on dwarf bushes or against walls. I have not seen any Black Currants grown in this fashion, but I do not doubt that they would be equally effective. I have grown both the Red and White Currant as short standards, and found them very useful in that way. J. H. Hudson, Gunnersbury House.

GARLIC. Surely Mr. J. Dunn's advice, on p. 25, to allow "a little more space between the rows for Garlic than for Sunflowers, as a slip of the pen, and he meant to have written rather less space. When one considers the two bulbs, which are, to the botanist, closely allied, but quite distinct to the cultivator, it is evident that the Garlic rows need be merely sufficiently far apart to allow the free use of the hoe, and that 6 inches from plant to plant is ample. Whereas the whole bulb of Shallot is planted and it forms a little colony of separated bulbs around it, the Garlic bulb is first pulled apart into "cloves," a good bulb contains as many as 15 cloves, and each clove also produces its little colony, but the individuals are packed closely together, and confined, sometimes very loosely, in a general covering. The so-called "bulb" of Garlic is in reality an aggregation of bulbs, and the base of each little bulb when separated is studded with fat, white root tips. There are two types of Garlic—the white-skinned, which is most used in this country, and the red-skinned sort, which, as in Onions, keeps longest. Although the best Garlic comes from France, quite good bulbs may be grown in England, as the sample I send from my own garden at Hamp ton Hill shows. In Southern France the growers still seriously and vehemently contend that the *gousse d'ail* must be set in November, whilst the moon is waxing, so that it may gain strength with the growing moon, otherwise failure is certain. The older cottager in Devon and Cornwall often treasures similar belief concerning sowing seeds and planting vegetables. Garlic succeeds well in a light, rich soil, which need not be pressed, as is general for Onions. The cloves should be pushed into the ground in lines 9 inches apart, allowing 6 inches in the rows. The earliest and largest bulbs are obtained by planting during the first half of November, but good bulbs may be grown from spring planting, and these will naturally keep longer. When planting in November the cloves should be pushed almost full length into the soil, merely leaving the tip exposed, but in the spring I prefer to bury only half the clove, as in this way the bulbs are cleaner and more attractive in appearance. The precise date for spring planting does not appear to be essential, though I like to plant during February, but the sample I send is from cloves planted on April 22 last. J. C. Bartlett

SOCIETIES.

ROYAL HORTICULTURAL.

JANUARY 30.—The fortnightly meeting held on Tuesday last in the Drill Hall of the London Scottish, Buckingham Gate, Westminster, was one of the smallest on record.

There were a few good exhibits of Orchids, only two collections in the floral section, and none of either fruits or vegetables. The rest of the exhibition was comprised of paintings, preserves, and sundries. The only award made by the Floral Committee was a Silver Bank Medal for a collection of Perpetual-flowering Carnations exhibited by Messrs. Atwood Bros., Hayward Heath. The other exhibit was a florist's group of *Eranthis* and *Acacia*, arranged by the excellent taste by Messrs. B. FLECK AND SONS, Hanover Square, London. A pale-flowered sport of *Primula malacoides*, with lighter green foliage and smaller leaves than the type, was the only novelty submitted to the Floral Committee. It was shown by Sir Wm. LAYBURN, Bart., Bureford, Dorking. No award was made to it.

Floral Committee.

President, Messrs. H. B. May (chairman), W. J. Bean, H. Green, Geo. Harlow, C. R. Fiddler, John Heal, Win. Howe, J. F. McLeod, E. Bowles, A. Turner, John Dickson, C. Dixon, H. J. Jones, Chas. E. Pearson, H. Cowley, W. P. Thomson, Geo. Paul, G. Routhie, Jas. Holson and E. H. Jenkins.

Orchid Committee.

President, Sir Jocelyn Colman, Bart. (in the chair); Sir Harry J. Veitch, Messrs. J. Wilson-Putner, Jas. O'Brien (hon. secretary), Frederick J. Hodgey, Patrick Rudi, F. R. Ashton, J. E. Sully, J. C. Cassels (with Arthur Dye, S. W. Foley, and R. A. Rolfe).

Eight novelties were entered to go before the committee, chiefly small plants flowering for the first time, but to a few was made.

Messrs. ARMSTRONG AND BROWN, Orchidhurst, Lurgidale, Wells, staged a selection of hybrid *Odontoglossum* and *Odontiodes* seedling plants with their first flowers, all of a high order of merit. The best varieties were *Odin*, Peerless, a standard *cymum* × *Ossulstunum*, a large and perfect white flower, with a large purple blotch in the middle of each segment; *Odin Peak*, a very large, white, with mahogany red markings; *Odin gaudyensis*, Orchidhurst variety, of fine shape, evenly spotted with clear red; *Odin Meteor*, Sandringham variety, large and finely blotched; *Odin ardentissim*, a pale, violet colour, with white spots; *Odontiodes Amethyst*, *Hall crispum* × *Bradshawiae*, with light yellow flowers bearing a horseshoe-shaped blotch in the middle of each segment.

Messrs. CHERRY-SMITH AND CO., Hayward Heath, showed *Odontoglossum crispum* var. *holtei*, a very fine typical form of *O. crispum*; the handsome *Odontiodes Florence*, *Odin Cooksoniae*, *Odin Doris*; *Laelia Cattleya*, *Sepha*, and *Cattleya Clotho*.

Messrs. HAYSON AND CO., Sandringham, staged a selection of hybrid *Cymbidiums*, including *C. Canbyi*, *C. Alexandri*, *C. Beatrice*, and *C. Schell*, the novelty being *C. Sybil sulphureum*, a large and upright flower tinged with yellow and having light rose markings on the lip.

Messrs. SANDER AND SONS, St. Albans, showed their new *Cymbidium Chaffinch* (*Cottianum* × *Doens*), with broad-petalled white flowers evenly spotted with purple, and showing well the good influence of *C. charnium*, obtained through *C. Cottianum*.

From Baron SINGHPOOR'S collection, The Dell, Englefield Green, came a fine flower of *Cypripedium Envybides*, *Shillanum*, one of the best of the batch raised at The Dell. The dorsal sepal, four inches and a quarter wide, was white with an emerald green base and densely spotted lines of rose purple. The broad petals and lip are yellow tinged with reddish purple, the petals being spotted with the same colour on the inner lobes.

Fruit and Vegetable Committee.

President, Messrs. Jas. C. Cheal (chairman), W. Pomart, J. W. Bates, Owen Thomas, F. A. Buryard, Ed. Harris, and Rev. W. Wilks.

SCOTTISH HORTICULTURAL.

JANUARY 16.—The annual business meeting of this Association was held on this date. Mr. Pirie, the president, was in the chair, and there was an attendance of sixty-five members.

The report by the Council for the session 1916 stated that, with the exception of the holding of its Chrysanthemum show, the ordinary work of the Association had been carried through in every detail, and it was also stated that the Council had decided to hold a series of four small exhibitions in conjunction with the monthly meetings in the current session, for which a schedule of prizes had been prepared.

The financial statement showed a deficit of £29 on the revenue, and that there was a considerable depreciation on the invested capital.

The Marquis of Linlithgow was re-elected honorary president for 1917; Mr. John Phillips, Granton Road Nurseries, Edinburgh, was elected president in succession to Mr. Pirie; and Miss Burton and Mr. M'Hattie were elected to the vacancies in the vice-presidencies. The seven vacancies in the Council were filled by the election of Miss Todd and Messrs. Crichton, Fife, Galloway, James, Macdonald and Taylor, and the secretary and treasurer and auditors were re-elected.

Beonia Mrs. J. A. Peterson was exhibited by Mr. John Downie, Edinburgh.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JANUARY 4. *Committee present*: The Rev. J. Crombholme (in the chair), Messrs. D. A. Cowan, J. Cypher, A. G. Ellwood, J. Evans, A. R. Handley, A. Hamner, D. McLeod, W. Shackleton, H. Thorp, and H. Arthur (secretary).

AWARDS.

FLESH-CLASS CERTIFICATES.

Cymbidium Schlegelii roseum (*Wipacium unguis*), *Odontoglossum Illustworth* (*Illustratum* × *Irreworth*), a finely formed flower of a deep purple colour, both from Dr. CRAVEN MOORE.

Laelia Cattleya Monae (*Octave Don* × *Lambertian*), a flower of perfect form, good colour, and well marked lip, from R. ASHWORTH, Esq.

Cypripedium Marshall Hay (*Chlo*, *The Strawberry* var. × *G. F. Moore*), a well shaped flower with round dorsal and beautifully spotted sepal, from TOM WORSLEY, Esq.

AWARDS OF MERIT.

Laelia Cattleya Sepha (*Islandiae*, *Odontoglossum Black*, *Watch*, and *Cypripedium inaequum* var.), all from R. ASHWORTH, Esq.

Cymbidium Schlegelii Conyngham var., and *Odontoglossum crispum tristes*, from Dr. CRAVEN MOORE.

Cypripedium Verdun (*Chlo* × *Lecanum Arabobryonum*), and *C. Traversyanum* var. *Pray*, from TOM WORSLEY, Esq.

CENTRAL CERTIFICATE.

To Mr. C. BRANCH (gr. to W. R. Lee, Esq.), for *Odontoglossum Colburni*, carrying a beautiful branched flower spike.

GROTES.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Davyport), was awarded a Large Silver Medal for a group of *Cypripediums* and *Odontoglossum crispum*. TOM WORSLEY, Esq., Haslingden, was also awarded a Large Silver Medal for a group composed of *Cypripediums*. Messrs. CYRBER AND SOSS, Cheltenham, were awarded a Silver Medal for a group of *Cypripediums*, *Cattleya Trianae*, *Sophronitis grandiflora*, *Oncidium cheiphoerum* and others.

CROP AND STOCK ON THE HOME FARM.

DAIRY COWS.

The present easterly winds, accompanied with 10 frost, are all against the production of milk, grass is scarce, and hopes for even a fair yield of milk must be based on the supply of artificial food. There are many who think that extra food for cows is not necessary. In such weather as now it is essential. Where a combination of rich milk and a maximum quantity of butter are

required, the dairyman must keep pure-bred animals. Guernsey and Jersey cows are unequalled for high quality produce. I prefer the former breed for three reasons. First, they give more milk in bulk, the animals are hardier, more able to withstand cold, capable of succeeding on heavy soil, and, what is of much importance, they are of more value to the butcher when their milking days are ended, being of larger build. Jersey cows are a trifle richer in their milk and butter yields, but they are apt to grow coarse on heavy, cold soil. Where the highest quality only is considered Jerseys should be preferred.

A cow in full profit would be an animal such as we have here, which calved on December 20 last, and is now giving thirty-two pints (four gallons) milk per day. The eleven cows in milk are producing on an average 7 lbs. butter per week; some three of the animals are approaching the "dry" stage, having calved in March, 1916. In addition to the butter noted, twenty-seven gallons of milk are also consumed during the week from these cows. Does anyone think such results could be achieved by natural food—grass and hay? Such facts should convince the most sceptical of the desirability of high feeding.

I recommend the following food diet per day: Sliced Mangolds of the Tankard type, 50 lbs.; long Hay, 15 lbs.; Bibby dairy cake, 4 lbs.; crushed Oats, 4 lbs. If linseed and cotton cake is used in the place of Bibby cake (which I do not recommend), 2 lbs. each should be given.

The total amount of each is noted for the day, but it should be given to the animals in half quantity twice daily, morning and afternoon.

Some persons object to the use of Mangolds on the score of tainting the butter. If the animals are fed *after* milking no harm will result.

Pigs.

Never has the price of pork and bacon pigs been so high as at the present; small store-pigs may have been equally dear. Scarcity at home and lack of imports are no doubt the cause. To reduce prices the number reared should be largely increased. The high price of food no doubt deters many from increasing their stock. Many have said how valuable is the village pig tub—the offal collected from the cottages known as swill. When used properly with meals much may be done to cheapen the cost of pig food, but when people believe they can keep small pigs on such food alone there is certain to be trouble before long. One of the worst ingredients that all too often finds its way into the swill tub is common soda, used for washing up the dinner-utensils. I would urge a strong caution to all those of inexperience to use carefully such food.

A good type of sow commencing at eight months old will produce five litters within two years; these averaging nine or ten pigs to the litter, will be quite satisfactory. The question will be, what is the best breed to keep. For quick growth, selling as stores at eight weeks old, porkers of from three to four score pounds at four months, or bacon pigs up to ten score pounds. A combination of rate breeds is preferred. A Berkshire boar crossing a large Yorkshire White, or a Middle White Yorkshire with a Large White or Berkshire sow, or a Berkshire boar with a Sussex sow, produce good pigs. I need hardly say that much depends upon the management in judging or estimating results. A sow can be kept cheaply on bran with a small quantity of middlings, Cabbage and Mangold. A run on grass, or in an open yard is an advantage, as exercise is an absolute necessity, even if but for a short time during the day. When the little pigs are four weeks old they should be encouraged to eat in a separate trough away from the mother. Stew milk, with a small quantity of shavings, forms a suitable diet. At five weeks the boar pigs should be castrated; as six weeks, weaned. Feeding them in small quantities three and four times daily, progress will quickly be made. For fatten-

ing older pigs, Baileys meal, Maize meal, and sharps, mixed with milk, if available, is a good mixture.

RENOVATING PASTURES.

To increase the amount of grass for cattle and the supply of Hay for the Army are points of special importance; all pasture land should be made to yield a maximum quantity. If it will not do that it should be ploughed up and cultivated for a few years, when it might be relaid to grass.

Basic slag is one of the best of stimulants for grassland, especially chalk subsoils, but as it is now too late to apply it to show a beneficial result this season I should defer its use until November. For this season's crop farmyard manure pretty well decayed should be spread at the rate of fifteen tons per acre; failing this, superphosphate 4 cwt. per acre in March would be a good substitute.

Before applying the manure well stir the grass surface, using heavy iron harrows. This will admit the manure to the roots more quickly, and aid in eradicating moss, which in some fields is a nuisance. Until the manure disappears continue to harrow, and finally collect stones and rubbish, preparatory to rolling down firmly in this way consolidating the grass in such a manner that the roots will secure full advantage from the manure.

PEAS FOR STOCK.

The feeding value of Peas is so high that more ought to be grown. Sheep, horses and pigs specially appreciate them. A straw crop sown in the autumn is a good preparation. If farmyard manure was not then available, 4 cwt. superphosphate, sown when sowing the seed in March, is a good substitute. The harrowing necessary to bury the Peas will aid in burying the manure also. Three bushels, weighing 63 lbs. per bushel, per acre of seed is ample. Either drill or sow broadcast. The former is best, as it enables seeding to be more efficiently done. Early Dan is a good variety. *E. Molyneux*

CANADIAN VISITOR TO ENGLAND: *Private C. H.* There are many places in Britain where Fuchsias succeed sufficiently well out-of-doors to form hedges, though, of course, they are not the same varieties as those usually cultivated in glass-houses. Some of the best hedges we have seen are in the gardens at Penrhyn Castle, near Bangor, North Wales, and at the little village of Lee, in Devonshire, a short distance from Ilfracombe. Then in certain parts of Devonshire and Cornwall and in the Isle of Wight Fuchsia hedges may be seen, though not so big and flourishing as in North Wales and near Ilfracombe. In Britain the Mistletoe most commonly grows on Apple trees in the older orchards. It is no doubt common enough in some of the orchards in your present county, Hampshire. You would do well to call at some of the farms, and in this way we think you will easily obtain information of its whereabouts. The firm that distributed Clematis Jackman is G. Jackson and Sons, Woking, a firm that is still flourishing. When you speak of George Mawley we think you mean Edward Mawley, the late secretary of the National Rose Society, whose death occurred a few months ago. The late Mr. Mawley's residence was at "Rusbank," Berkhamsted, in Hertfordshire. If you happen to be in London in June or July you will find good displays of Dwarf Roses at the Royal Gardens, Kew, and the visit there would be interesting to you in many ways. You might also visit some of the Rose nurseries.

MUSHROOMS ON LAWNS. *H. B. H.* You could not expect much success in growing Mushrooms on lawns, unless the soil contains a good quantity of organic material in a suitable condition for the fungus. You would require to spawn the turf; the spawn may be purchased in "bricks," and these would require to be broken into pieces about the size of a Walnut and inserted two inches deep at intervals of a foot or so. It would not be advisable to mow the grass afterwards.

NAME OF FRUIT: *H. T. O.* Blenheim Pippin.

NAMES OF PLANTS: *G. P.* *Odontoglossum Andersonianum*, a natural hybrid between *O. crispum* and *O. gloriosum*.—*W. H. H.* *Asparagus decumbens*; not a rare species, although not so frequently met with in gardens as *A. plumosus*.—*Dublin*, *Skimmia japonica*.

SEED POTATOS: *Constant Reader*. Place the seed tubers of both the early and maincrop varieties in shallow boxes now, putting the boxes in a position where the light reaches them, in order that the shoots of the tubers may grow strong.

STRENGTHS OF LIME SULPHUR: *Enquirer*. Lime-sulphur as sent out by the firms who make it usually tests at 32° to 35°, as shown on the Baumé hydrometer scale, or at 1.2351 to 1.2946 on the ordinary specific gravity hydrometer. The former is much the easier to read. At such a strength one gallon of the concentrated lime-sulphur should be used with 12 to 12½ gallons of water, for use when the trees are dormant, just before the buds begin to burst. After leaves, or even their buds, show, the summer strength—one gallon of the fluid to 40 gallons of water—will be as strong as will be safe. The winter strength will serve for all varieties while they are dormant. The summer strength will serve for all varieties of Plums and for all kinds of Apples except Cox's Orange Pippin, which any wash at all caustic will partially defoliate. Possibly this variety might withstand a 1:50 dilution; but this is doubtful. It is questionable whether it will withstand a wash strong enough to check scab after the foliage is open. On other varieties the ordinary summer strength may be used, if they are subject to scab, just after the blossom has fallen, and again three weeks later.

WINTER WASH FOR FRUIT TREES: *E. H. H.* For old trees with rough bark, moss and lichen, especially when infested with the woolly aphid (the so-called American blight), caustic soda, 20 lb. to 100 gallons of water, is the most effective wash, and may be applied at any time after this while the trees are quite dormant. For trees not in such bad condition, and not affected with brown rot, linewash is preferable, as it cleanses trees of moss, and is believed by some authorities, including fruit growers, to check aphid attack, either by coating the eggs of the pest so as to stifle the aphides when just hatched, or at least to hamper them so that many of them perish. For the latter purpose the wash should be as thick as can be got through a sprayer with a coarse nozzle made especially for linewash, 1½ cwt. to 2 cwt. of quicklime to 100 gallons of water. The lime should be gradually slaked, stirring frequently, and not diluted more than necessary until it is fully slaked. For Apples or Plums affected with brown rot lime-sulphur is to be preferred as a possible though doubtful check, and this is the wash to use on Plums to prevent bud-eating by birds, immediately after an attack begins. Apart from its use against bud-eating, the best time to spray is when the buds are on the point of bursting, and this is the case also for linewash. For use while trees are dormant 12 gallons of lime-sulphur of the strength usually supplied by firms who make it should be used in 100 gallons of water. See answer to *Enquirer*.

MARKETS.

COVENT GARDEN, January 31

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—Eds.

REMARKS. It is many years since there was such a shortage of cut flowers in Covent Garden. Azaleas, Carnations, Daffodils, Richardias (Arums), Lilium longiflorum, L. lancifolium album, Lily-of-the-Valley, and a few Tulips are the principal flowers on sale from home growers, and there is only a limited supply of these. Prices are again higher generally. There is also a shortage of flowers from Guernsey and Sicily in flowers reached the market from these islands on Monday last. Practically all the French flowers that worked out and up to this morning reached the market in an almost unbreakable condition. The majority of the white Narcissus and Violets could be fitted out in the buckets in a solid top block. French flowers are more in demand at this time of the year, as Chrysanthemums are in shell and other home grown flowers, such as White Tulips, are almost unobtainable, and all white flowers are realising almost record prices.

REMARKS. There are fewer supplies of English Apples, but imported Apples are fairly numerous; the over-sea fruits are sent principally in boxes. Pear-commodity stocks in London are very small. A consignment of fruit is due to arrive from Cape Colony. Old black grapes there are sufficient to the demand. Some good samples of Teneffe Tomatoes are obtainable. Canary Bananas continue to be a short supply. Vegetables, both dried and outdoor, are scarce and expensive. F. H. R. Covent Garden Market, January 31, 1917.

Potatoes.

Lincoln		King Edward ..	11 0 12 6
— Arran Chief ..	11 6 12 0	Queen ..	11 0 12 6

REMARKS. Trade is about the same as last week. Few buyers are arriving on account of the frost, consequently stocks in London are very small. Edward J. Venburn, Covent Garden and St. Pancras, January 31, 1917.

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS'. The usual monthly meeting of this Association was held at St. John's Parish Rooms on the 25th ult., Mr. V. Bernard presiding. There was an excellent attendance to hear Mr. B. T. Barker, M.A., give a lecture on "The Apple." The prizes, kindly given by Dr. Shingleton Smith, for two dishes of Apples, produced a good competition, and were won by Mr. Scott (1), Mr. Clark (2), and Mr. Bird (3).

CATALOGUES RECEIVED.

T. S. WADE, LTD., Feltham—Burgins.
JAMES H. DENN, Bourne-mouth—Fruit Seeds.

GARDENING APPOINTMENTS.

Mr. W. Payne, for the past 9 years Gardener to Sir H. F. and Lady DONALDSON, Wood Lodge, Shooters Hill, Kent, as Gardener to SIR WILLIAM CORRY, Bart., Norbury Park, Dorking, Surrey. [Thanks for donation to R.G.O.F. Eds.]
Mr. O. C. Walton for the past seven years at The Rookery Gardens, Westcott, Dorking, previously Head Gardener at Colley Manor, Reigate Heath, as Gardener to Col. O. H. OAKES, Newton Court, Bury St. Edmunds, Suffolk.

Do Not Forget the Gardener-Soldiers.

"Many thanks for the GARDENERS' CHRONICLE, which I have received safely each week through the kindness of Lady Theodora Guest. You will see that I am now in Mesopotamia. The CHRONICLE is very welcome to me out here; it seems good to read all the news in the old paper, and surely the GARDENERS' CHRONICLE is the king of all gardening papers."

This letter was sent us by a soldier in the Mesopotamia Force. YOUR soldier friend, who was a gardener before he went to the front, is a gardener still in sympathies and interests. HE longs to know what is going on in the gardening world now, and has no means of knowing unless YOU help him. Send him the GARDENERS' CHRONICLE. Keep him in touch with current gardening affairs. He will be most grateful for such an act of friendship. Send us a subscription for half-a-year—8s. 9d.—and we will take all the responsibility of sending the paper regularly to your friend, also reminding you patiently when the subscription is about to expire.

Write to us now, and give us his address.

41, WELLINGTON ST., STRAND, LONDON, W.C.

VEITCH & SON, EXETER.

Do Not Forget the Gardener-Soldiers.

"Many thanks for the GARDENERS' CHRONICLE, which I have received safely each week through the kindness of Lady Theodora Guest. You will see that I am now in Mesopotamia. The CHRONICLE is very welcome to me out here; it seems good to read all the news in the old paper, and surely the GARDENERS' CHRONICLE is the king of all gardening papers."

This letter was sent us by a soldier in the Mesopotamia Force. YOUR soldier friend, who was a gardener before he went to the front, is a gardener still in sympathies and interests. HE longs to know what is going on in the gardening world now, and has no means of knowing unless YOU help him. Send him the GARDENERS' CHRONICLE. Keep him in touch with current gardening affairs. He will be most grateful for such an act of friendship. Send us a subscription for half-a-year—8s. 9d.—and we will take all the responsibility of sending the paper regularly to your friend, also reminding you punctually when the subscription is about to expire.

Write to us now, and give us his address.

MILES, Gardener to A. E. CUMBERBATCH, Esq.

SUTTON'S CENTENARY.

SUTTON & SONS, THE KING'S SEEDSMEN, READING.

nearly due to be executed, there was such a remunerative crop of Cox's Orange Pippin that a reprieve was granted, and now it is a question whether the Apples or the Plums will be removed.

BIRDS AND BUIES

Up to the end of January, birds had not begun to eat the buds of Plums. In the three preceding winters it was necessary to spray Monarch Plums before the middle of that month. Possibly the severity of the weather has induced the bullfinches to remain in the shelter of the woods. At any rate, very few have been seen in or near the orchards at present. *Southern Grower*.

ORCHID NOTES AND CLEANINGS.

TWO FINE ODONTOGLOSSUMS.

MR. W. H. WHITE, who has charge of the Orchid collection of Paulia Ralli, Esq., Ashted Park, Surrey, sends flowers of two remarkably fine *Odontoglossums* of extreme types, showing well the great work which the hybridist has done in extending the range of form and colour in this favourite cool-house genus.

blooms with pure white sepals and petals and rosy mauve lip, having good lines from the base. The new *C. Perenol* (*Percivaliana* × *Enid*) raised at Bleheim, which is an excellent improvement on *C. Percivaliana*, has good large bluish-pink flowers with purplish crimson lip. Other not-worthy Bleheim hybrids in bloom are *Saphro-Laelio-Cattleya Eriata* (S. L. C. Eros × *C. latifolia*) with pretty Cherry-red flowers, *Cattleya Faldahana* (*Fabia* × *Percivaliana*), and *Laelio-Cattleya Gothaura* (L. C. St. Gothard × *Daviana aurea*). The large batch of *Laelia anceps* is beginning to make a good show, and a fine *Sophronitis grandiflora* with thirty scarlet flowers is a perfect specimen.

PLANT NOTES.

EPACRIS PURPESCENTES FLORE PLENA.

THIS *Epacris* differs from the other species and garden forms of the genus in its double rosette-like blossoms, which are very freely borne. It was introduced from Australia by the late Mr. William Bull, of Chelsea, in the seventies of the last century, and was given a First-class Certi-

mer bedding, is also of considerable value for its winter-flowering qualities. Where a greenhouse or conservatory has to be kept gay at all seasons this *Calceolaria* is very useful, especially as specimens from 4 to 6 feet in height. As such it is particularly handy for grouping, for most winter-flowering plants are considerably less in stature than this. For blooming at this time of the year the plants may be struck from cuttings early in the spring, or older ones may be grown on for this purpose. They can, during the summer, be grown out-of-doors; indeed, if given much the same treatment as *Chrysanthemums*, they will be well suited. This *Calceolaria* was raised many years ago at Trinity College Gardens, Dublin, by the late Mr. F. W. Burbidge, after whom it is named. It was regarded by the raiser as a cross between *Calceolaria Pavonii* and *C. dellexa*, which was formerly known as *C. fuchsiaeifolia*. Doubts have, however, been expressed as to the correctness of this, for though, judging by appearances, there can be no question but that *C. Pavonii* is one parent, the general aspect of the plant would suggest *C. amplicaulis* as the other. In the *New Hand List of Tender Dicotyledons* the parentage is given as *C. amplicaulis* × *C. Pavonii*. W. T.

FIG. 21. ONIONS GROWN FROM TRANSPLANTED SEEDLINGS. (See p. 59.)

Odontoglossum Bronze Dragon, of unrecorded parentage, has large, broad-petalled flowers of a rich reddish-bronze colour, with slight white margins and tips to the sepals and petals. The lip is white with reddish-rose blotches in front of the crest.

Odontoglossum ardentissimum Johnsoni (*Pescatorei* × *crispum*) has beautifully-formed flowers $4\frac{1}{2}$ inches across, the ground colour being pure white, two-thirds of the surface bearing deep, claret-red blotches, which in the petals cover the inner half. The lip is white, with ruby red blotches in front of the yellow crest.

ORCHIDS AT BLEHEIM.

IN the gardens of the Duke of Marlborough, Bleheim Palace, Woodstock (Orchid grower, Mr. Jas. Smith), a large-house of *Cypripediums* contains plants plentifully supplied with flowers, some of them being hybrids raised at Bleheim. One of the prettiest is *Cypripedium Arthurianum* Bleheim variety (*Fairrieanum* × *insigne Sanderi*) quite distinct from ordinary forms and with much broader petals. The large white dorsal sepal is effectively marked with dotted purple lines, similar markings appearing on the Primrose-yellow petals and lip. Among the *Cattleyas* is a fine specimen of *C. Maggie Raphael alba* var. *Queen Mary* with five fine

tear by the Royal Horticultural Society on March 1, 1876, under the name of *Epacris onosmaeflora flore plena*. Owing to the working up of a sufficient stock being a slow matter, it was not distributed till the spring of 1883. Two plants were originally received from Australia, and in one of them the flowers were slightly suffused with blush, while those of the other were pure white. The two were sent out in 1883 as *Epacris onosmaeflora flore plena alba* and *nivalis*, at a price of one guinea each. There was a good demand for them, but *nivalis*, being the better of the two, was soon grown to the exclusion of the other. Apart from its rosette-like blossoms, which are closely packed for some distance along the erect shoots, the flowers themselves have a much shorter tube than the other species and varieties. Owing to the stout, almost succulent character of the main shoots, this *Epacris* cannot be propagated from cuttings so readily as the other kinds. In order to ensure success the stock plant or plants should be kept somewhat warmer than usual in order to weaken the young shoots. With this treatment they are not at all difficult to root.

CALCEOLARIA BURBIDGEI

THIS tall-growing hybrid *Calceolaria*, which is as large as specimens a good deal used for sum-

VEGETABLES.

SWEDDE TURNIPS

ON late years some of the leading seedsmen have made selections from the Swede Turnip, mostly grown for the feeding of cattle, quite suitable for growing in gardens. Varieties with white and yellow flesh respectively are obtainable, and are much harder than the ordinary garden Turnips. Seeds may be sown in drills 18 inches apart on ground that has been well worked; thin the seedlings out about 6 inches apart. For succession sow at the end of May and again the middle of July. I think this particular vegetable has not found a home in every garden, but it is well worth trying. When peeled and cooked it has a most pleasing flavour, which most persons enjoy. It is a vegetable for anybody during the winter and spring; for instance, the working man can have the best substitute for *Seakale* that is grown by placing a few Swedes together in a bed of soil or ashes in a frame or shed and excluding the light, when the roots will supply young shoots that will be most appreciated. There is no waste with the garden Swede, and it is excellent food, cooked or raw, for cattle, poultry, pigs and rabbits. *C. Davis, Holy Wells Park Gardens, Ipswich.*

ONCE GROWN POTATO SEED.

In this neighbourhood some of the growers contend that the best results from Scotch seed are obtained the second year. My experience is that the first year from Scotland gives the best result. In the selection of seed, as in all matters connected with the land, there are exceptions to every rule. A cottager close here grew Ringleader twenty years ago, and has continued to do so ever since from his own saved seed, and with good results. He selects the tubers carefully as he digs them, grows them thoroughly, and stores them carefully. *E. M., Bishop's Waltham*

UNDER-CROPPING ORCHARDS.

WHILE the market grower makes abundant use of all available ground under his standard fruit trees, this opportunity is usually left undeveloped in private gardens. As the recent correspondence in the *Gardeners' Chronicle* on intercropping shows, private gardeners as a class are too given to the opinion that "one plant, one crop" should be the golden rule in gardening. If space and labour were unlimited this, no doubt, would be ideal, but those conditions are but rarely found. It is also often contended that the digging needed to grow profitable crops in orchards would adversely affect the fruit trees. But if this were so the market grower would certainly abandon the practice, and, moreover, the great success which attends under-cropping a large Apple plantation at Gorton Park is also being able to show that it may be done in private gardens without detriment to fruit trees, for these same trees have furnished many of the dishes of fruit with which, in the recent past, Mr. Allan won so many prizes at the R.H.S. Shows and elsewhere. A few instances ago I greatly admired the appearance of the large breadths of "Winter Greens," Kale, Savoys, and Broccoli—in this orchard at Gorton Park, when Mr. Allan remarked that it was his general custom, and that it paid.

In the Plum orchards of Hounslow and Isleworth under-cropping is almost invariably the rule, and while such permanent crops as Gooseberries, Blueberries and Raspberries, the latter for supplying cut blooms or cut sprays of bright colour earlier in the year, are most generally, literally miles of Norwalk, Wallflower and various Brassicas which are annually planted may be seen in their respective series. It is more than probable that so far from the soil disturbance being harmful to the fruit trees, the reverse is the case, and that the loss of roots inevitable from the digging is amply repaid by the improvement of the surface soil and root action consequent on aeration of the soil, and the manure added for the under-crop. *F. C. Bartlett.*

SELECT VEGETABLES.

WHEN the cultivation of vegetables for the needs of the country is engaging general attention, it will be well to consider carefully those kinds and varieties which are not only the simplest to grow, but also most valuable as produce. To assist this selection I will state briefly my own experience. I am fully alive to the difficulty of advising alike for all parts of the country, for the reason that in some districts it is impossible to grow certain kinds of vegetables. To these objections, however, there is but one answer, and that is, "grow both the kinds and varieties which are best suited to the particular district."

POTATOES—There is no question as to Potatoes playing the most important part in providing vegetable food for the nation. In spite of the suggestion that Potato planting may be overdone, my advice is to plant largely. The ground must be well prepared. The varieties best for the locality should be planted, and the sets should be properly sprouted. Allow plenty of room both between rows and sets, and for preference grow early and mid season varieties, rather than late

ones, as these are not so susceptible to disease, and the ground can be cleared for other crops in the autumn. My favourite varieties are Midlothian Early, May Queen, Windsor Castle, Dobbie's Prolific, King Edward VII., Great Scott, and the Factor. Arran Chief, which does well in many places, is not worth growing here, the quality being of the worst.

ONIONS—These will unquestionably be planted in much larger quantities than has ever been the case before in this country. Both the land and the climatic conditions are suitable if the right methods of cultivation are adopted. My advice is, sow in boxes or cool frames early in February. Scatter the seeds thinly, and, when of sufficient size, plant them on well-prepared ground of a fine tilth, 4 to 6 inches from plant to plant, and 15 inches from row to row. If made firm and well watered in there is little fear of failure, as the Onion is very hardy, and, if properly prepared, no spring frost will injure the plants after the first week in April. By such a method as this the crop prac-

FIG. 22. LEEKS GROWN BY MR. W. ROBINSON, GORTON, LANCASHIRE. THE STEMS HAVE A LENGTH OF 22 INCHES AND A GIRTH OF 6 INCHES.

tically escapes the ravages of the Onion fly, a much heavier crop is assured, the bulbs mature earlier and keep better, and the ground is cleared sooner for succeeding crops. A crop raised in this manner is illustrated in fig. 21.

CABBAGE—This is one of the few vegetables which refuses to do well in many districts, especially the main crops, and unless the land and locality are suitable it is far better to employ the ground for other purposes, but as this vegetable is generally in large demand it should be grown more extensively in those parts which are favourable for it.

CABBAGE—As a green vegetable, the Cabbage has no equal. It can be grown by anyone, in any district, and by making various sowings throughout the year, there is no day or season when it cannot be had if required.

PARSNIPS are a nutritious and desirable vegetable. They require a long growth, and should be sown if possible in February, on deeply

worked, and not too rich a soil. The newer and better varieties only should be grown, as there is no comparison between these and some of the older sorts.

BRUSSELS SPROUTS are one of the most hardy and prolific vegetables for winter use, and should be grown by all. Two sowings should be made, one in March and one at the end of April. Early Dwarf Gem is quite the best variety I know.

CELERY—A vegetable generally in great demand. Nothing that I know of does the ground more good, and intercropping can be carried out. It is valuable both in a cooked and raw state. For winter use select a good strain of either a pink or red variety, which varieties are much more hardy than the white. There are many worthless varieties on the market.

CELERIC OR TURNIP-ROOTED CELERY—Celeric is not nearly so much grown in this country as it deserves. It should be treated in the young state precisely in the same way as Celery, but should be planted on the flat, the ground being deeply worked and heavily manured. It requires an abundance of water during dry spells. Lifted in autumn, it should be stored in sand or ashes, and will last good all the winter. It is appetising and nutritious, and has a flavour something between a Parsnip and Celery.

BETROOT—Though perhaps not so important as many other vegetables from a culinary point of view, a small quantity should be grown in every garden.

BURFOLE OR KALE. Both the Scotch and Cottage varieties should be grown for winter greens; each of these is very prolific, hardy, and of delicious flavour.

SAVOY—A very hardy vegetable which should be grown by all. It is often sown too early, and is spoiled before mid-winter. Savoys are certainly better cut after frost, and should be at their best during January and February.

LEEKS—We have much yet to learn from our friends over the Border as to the worth of Leeks as a vegetable. They should be grown by everyone possessing even the smallest garden. Well grown and nicely served, Leeks are most appetising. The plant is extremely hardy, and can be had in use from August to April. Most gardeners should grow more Leeks.

MUSHROOMS—Wherever fresh horse-droppings are procurable Mushrooms should be grown, either under cover or in the open. The manure is never wasted, and good Mushrooms are always in request. They are a nutritious and extremely palatable food, and will often take the place of more substantial dishes.

CUCURBIT. Sow in spring on well prepared ground. Dig up and blanch in a cellar, or Mushroom-house, at any time during the winter. Use both in a cooked and a raw state. This is a vegetable largely grown on the Continent, and deserves more extensive cultivation here.

PUMPKINS are one of our most valuable vegetables, but they are much neglected. They should be grown in a sunny position, and raised and cultivated like Vegetable Marrows. The Pumpkin may be trained up buildings and pergolas, grown on the flat, or planted on rubbish heaps in the summer. The fruits should be exposed to the sun after they have begun to swell. They should be cut and stored in a dry, frost-proof room before winter, and used as required. If they are cut in much the same way as a cheese, the same specimen, provided it is properly ripened, will keep in a good condition for a fortnight or three weeks.

SPINACH BEET. This is one of the most useful and prolific green vegetables grown, and when nicely cooked can hardly be told, except by experts, from ordinary Spinach. Sow early in the spring, and when quite fit for picking the plants will continue to supply fresh leaves for fully twelve months.

TURNSIPS.—Both Swedes and the white varieties of turnips, though not so nutritious as many other vegetables, are, nevertheless, valuable as a food during autumn and winter, and the greens in spring are much sought after. The best Turnips for winter use should not be sown before the end of August or the beginning of September.

TOMATOES.—Though frequently looked upon as a luxury, a well-ripened Tomato with a very moderate amount of cold meat, or even without it, will often make a good meal in the hot days of summer and autumn. Either under glass, or in the open where the plants can be trained against a building or wall, some should be cultivated. I have no hesitation in stating that my favourite variety, viz., Sunrise, and for a yellow one its golden sport named Golden Sunrise, is the finest all-round Tomato yet raised, either for the open or under glass, winter or summer.

KOHL-RABEL.—Some of the improved small varieties of this plant, which is generally cultivated on farms, are well worthy of a place in the garden, especially on hot, dry soils, where they do well, and make a splendid substitute for the Turnip. Sow at intervals during summer and autumn for winter use.

VEGETABLE MARROW.—This should be grown wherever possible. Endeavour to start the plants early by planting them out on mild beds in portable frames, removing the latter when it is safe to do so, thus prolonging the season. Ripe fruits may be used much in the same way as Pumpkins, and they make excellent jam.

JERUSALEM ARTICHOKES.—A most profitable crop to grow, as the plants need little attention after the ground is once planted, will thrive in any soil, and are well suited for making a screen. The white variety is much to be preferred to the red one.

There are, of course, other vegetables which may be grown according to requirements, but I have purposely dealt with those only which are likely to be most serviceable in assisting us to tide over a possible period of food shortage, *Edwin Beckett, Aldenham House Gardens, Herts.*

TREES AND SHRUBS.

VERONICA LA SÉDUISANTE

The last few winters have been so mild that the fact that this variety escaped injury when planted in an exposed position, as referred to by your correspondent, *J. F.*, page 52, may be thus accounted for. It yet remains to be seen how it has fared during the severe weather that we have so far experienced this year. While the different garden hybrids of *Veronica speciosa* are among the most handsome of autumn flowering shrubs in the favoured parts of these islands, they cannot be depended upon in colder districts, indeed, in the neighbourhood of London they are frequently injured, even if not killed outright, should a moderately severe winter be experienced. Some four years ago last autumn I saw several varieties doing well on the slopes of Coumbe Wood Nursery, but they were expected to suffer severely in the event of a sharp frost. Where they cannot be depended upon to hold their own out of doors, they are still extremely useful for the embellishment of the greenhouse or conservatory. They are very readily struck from cuttings in early spring, and if stopped when young, will make neat flowering plants by autumn. Apart from the variety *La Séduisante*, the following are also very desirable for pot culture. *Attraction*, deep violet; *Conquête*, pale lavender; *Diamond*, bright crimson; *Gabrielle*, rich pink; *Mauricie*, blue mauve; *Mont Blanc*, white; *Spéculend*, rich purplish mauve; and *Vallière*, blue. *H. T.*

THE FLOWER GARDEN.

By W. J. CRUISE, Gardener to Mrs DEMPSTER, Keele Hall, Staffordshire.

PROPAGATING BEDDING PLANTS.—The following plants may be propagated from cuttings during the next few weeks:—*Alternanthera*, *Heliotrope*, *Verbena*, *Lobelia*, *Marguerite*, *Coleus*, *Fuchsia*, *Ageratum*, *Tropaeolum*, *Salvia*, *Lantana*, *Petunia*, *Iresine*, and *Pelargonium*. Insert the cuttings in well-drained pans or boxes filled with light, sandy compost. Make the surface smooth, and cover it with a thin layer of sand. Make the cuttings firm in the soil, and water them through a fine rose. They should be rooted in a temperature of 65° to 70°. The *Pelargonium* cuttings should be inserted around the rims of 5-inch pots.

PLANTING HEDGES.—The present is a suitable time for planting most kinds of hedges. The ground should be well trenched and manured. *Ligustrum* (Privet), *Hawthorn* (mailed), *Beech*, and *Holly* are all suitable for making boundary hedges. Plant the Privet and Quick in single rows at 6 inches apart, treading the soil firmly about the roots. Cut the plants down to within 6 inches of the ground after they are planted. The common *Holly*, associated with Quick, makes a capital hedge. Evergreens, such as *Yew*, *Holly*, *Cupressus*, *Laurels*, and *Thuja* *Lobbi*, should be chosen for the flower garden and pleasure grounds. They should be planted 18 inches apart in single rows or the abutments, according to the size of the specimens and the purpose for which the hedge is required.

OVERGROWN SHRUBS.—Old, straggling shrubs or trees of *Laurel*, *Holly*, *Box*, *Yew*, *Ligustrum* (Privet), *Viburnum*, *Laurustinus*, and *Rhododendron* that it is not convenient to grub up and remove should be sawn off close to the trunk during the next few weeks, in mild weather. At the end of the season the stumps will be covered with young growths, and in two years the plants will be again in fair condition.

LAWNS.—Any necessary alterations to lawns that were not finished in the autumn should be completed forthwith. If new lawns are to be made, get the ground dug in preparation for sowing the seed next month. Should the soil be of poor quality, enrich it with a liberal amount of well-decayed manure. On no account should the soil be brought to the surface from a greater depth than 12 inches. Make the surface firm and smooth by repeated levelling and rolling. Existing lawns should be thoroughly brushed with *Birch* brooms to distribute worm-casts, and the turf rolled during mild weather. About the end of March apply a dressing of lawn manure mixed with an equal bulk of finely sifted soil. Give two or three dressings of this material in the early spring, using the compost at the rate of 1 lb. to four square yards.

THE ORCHID HOUSE.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gattop Park, Reigate.

DENDROCHILUM. Plants of *D. glimacomm* and the variety *validum* will now be developing new growths, and as soon as they reach a height of 2 or 3 inches will commence to push forth new roots, also their slender grass-like flower spikes; any that require fresh rooting material should receive attention at this stage. A suitable compost may consist of two-thirds *Osmania*-fibre, one-third fibrous loam with all the small particles removed, adding some chopped *Sphagnum*-moss and crushed crocks to render the soil porous; the plants should be given a moist position in the intermediate house.

DENDROBIUM. Many of the early-flowering species of this genus and their hybrids that have been resting in a house of comparatively low temperature, in which the flower-buds are well advanced, may now be placed in a warmer and

more moist atmosphere, but care must be taken that neither too much heat nor moisture is allowed, or they will start rapidly into growth, causing the flower-buds to turn yellow and drop off or produce flowers of inferior quality. Apply water sparingly at the roots, giving just sufficient to keep the pseudo-bulbs from shrivelling, affording a little extra as the flowers expand, but even then and until the flowers fade, and the young growths commence to develop new roots, watering must be done with great care. The Cattleya house is a very suitable place to grow the plants while the flowers are developing. Keep a sharp look-out for slugs, which damage the flower-buds as soon as the latter begin to develop; traps of damp bran and Lettuce leaves may be placed about the houses near the plants and the pests searched for at night and early in the morning.

SOPHRONITIS GRANDIFLORA.—This brilliant winter-flowering Orchid has been blooming for some time past, producing its flowers from the partly developed pseudo-bulbs. The plants should be kept sufficiently moist at the roots to maintain the *Sphagnum* moss on the surface of the pan in a green and healthy condition, taking care that the water does not lodge in the centre of the young growths, as this would cause the new pseudo-bulbs to decay. Plants requiring fresh rooting materials should receive attention when roots are seen to develop from the new pseudo-bulbs. They are best grown in shallow pans suspended well up to the light at the warmer end of the cool house.

MILTONIA.—Many of the Brazilian *Miltonias*, such as *M. Morelliana*, *M. spectabilis*, *M. Lubbersiana*, and *M. Bluntii*, will soon be developing new roots. Any that require it should be repotted as soon as the young roots appear above the base of the leading shoots. It is important that the young roots be not injured. The plants succeed best when grown in shallow pans in a compost of *Osmania*-fibre with a small quantity of *Sphagnum*-moss, chopped up moderately short, and a liberal amount of crushed crocks. Plants that have grown from the middle and/or the sides of the pans should be divided. Remove the old pseudo-bulbs, excepting for two or three behind each new growth, and arrange the plants fresh into shapely specimens. If the roots are not sufficient to hold the plants firmly in the pans, fix them to the soil by means of small wooden pegs. These plants should be given a shady position in the intermediate house. *Miltonia cavilliana* and *M. Blountia* are now growing freely. Plants that are well rooted will from now on and until they have completed their pseudo-bulbs, require an increased amount of water at the roots. Each plant should be watered thoroughly, and allowed to become dry between each application. A good preventive of thrips is to spray the plants overhead once a fortnight with a solution of *Ononis* Extract at the strength of half a pint of the infusion to three gallons of rain-water. Thrips, if present, may be destroyed by immersing the leaves and young growths in the insecticide.

PLANTS UNDER GLASS.

By J. G. WERTON, Gardener to Lady NORTHCOOTE, Eastwell Park, Kent.

THE PALM HOUSE.—All Palms should be looked over, and those needing a shift repotted. The others should be top-dressed with a little rich compost. It is not necessary to give Palms very large pots or tubs. As long as there is sufficient room in the pot to apply regular top dressings of manure, and abundant supplies of water, Palms may be kept quite healthy in the same pot for several years. But when the receptacles are crammed with roots watering must be very thorough; neglect in this respect will quickly show itself in the yellow and starved appearance of the leaves. Soot water and liquid manure are of great assistance in keeping the foliage a deep green. Much atmospheric moisture should be maintained in the Palm house, as tending to diminish insect pests. Scale insects and thrips are perhaps the most troublesome, and to keep these in check the plants must be regularly cleaned. See also the plants with water but

to 120° is an old and efficient method of killing scale insects. Sponge the leaves afterwards with an insecticide.

KENTIA.—When potting the stronger-rooting Palms, such as Kentia, Phoenix, Corypha, and Areca, the principal ingredient in the compost should be good fibrous loam, with the addition of a little sand, and charcoal. Good drainage is essential, as plenty of water is required when the plants are in full growth. The most useful varieties of Kentia are K. Forsteriana, K. Belmoreana, and K. australis.

COCOS WEDDELIANA AND GEONOMA GRACILIS.—These two Palms are good examples of the finer-leaved sorts, which should always be grown for table decoration. When potting these more delicate-rooted Palms, peat should be used in equal proportions with loam. Do not over-water the plants when small. They thrive best when plunged to the rim in a bed of Coconut-fibre refuse in the warmest part of the stove. Arrange them thinly, in order to preserve the lower leaves in perfect health. The daily syringing will probably provide sufficient water.

PHOENIX ROEBELINII.—This is one of the best of ornamental Palms. Being somewhat harder than the majority of Palms, it can be used in corridors and cold conservatories without fear of injury by cold.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. Arthur J. DEXY, Abbots Wood, Godalming, Surrey.

STRAWBERRIES.—In plantations which have not been mulched the surface soil should now be lightly forked up, and a good dressing of well decomposed manure placed over it. Failing this, a dressing of bonemeal and soot will be found beneficial. Weeds should be carefully picked up by hand. Prepare a plot of ground by turning it and adding manure, so that the soil will be ready to receive plants next month. Plants of Royal Sovereign which have been wintered in small pots will succeed well under this treatment. A good system for producing an early crop outside is to plant crowns on a south border, and cover them with frames, about the beginning of April. These fill up a gap between those which have been forced, and the general main crop outside.

COBNUITS AND FILBERTS. Cobnuts and Filberts should be pruned at once, standards, as well as bushes. Thin the branches out well in the centre of the trees. Nuts can be made a paying crop, and there is a likelihood of good crops this year, judging by the abundance of male catkins. A good dressing of old potting soil over the roots acts as an invigorator; old Chrysanthemum soil will do, or any that has been enriched with manure.

CRAB APPLES. It is not too late for intending growers of Crab Apples to plant trees. John Downe, The Dartmouth, Salsarian, and The Langley are all good varieties.

VINES.—Vines should be pruned at once. Cut the spurs back to one strong eye, and train the extension growths. Well trained vines are very ornamental in the garden. Royal Muscadine and Sweetwater are excellent for fruiting; these should be planted on warm walls in well drained soil.

APPLES.—If it is intended to plant Apples before the spring, I would strongly advise the selection of a few really good varieties, such as are known to do well in the district. Some of the old and well-tried varieties are hard to beat; for instance, Dumelow's Seedling. This fruit is about the best cooking Apple there is, and lasts for over four months in excellent condition when carefully gathered and properly stored.

FRUIT ROOM.—Keep an eye on all fruits, removing all mould and blighted specimens; admit a little air to the fruit room.

GENERAL REMARKS.—Push forward the work of pruning, tying and nailing trees on walls, and clean any that may require it. When the weather

is unsuitable for work in the open, prepare all kinds of stakes and sharpen and clean all tools. Spraying may be done now to kill insect pests and moss on the branches of fruit trees. Large orchard trees will be improved in appearance by spraying them with a weak alkali wash. Good results on the trunks of the trees should now be pressed. I have seen many codlin moths and other pests caught quite recently from the third application.

THE KITCHEN GARDEN.

By J. DEUX, Foreman, Royal Gard. Windsor.

ONIONS.—The plot on which Onion seeds are to be sown should be prepared as soon as the state of the soil will permit. If the ground was trenched and manured in the autumn, a light forking only is necessary, and the soil should be made as fine as possible as this work proceeds, after which it should be left until it is dry enough to crumble under the foot. It is better to leave the sowing for another month than to sow before the soil is suitable. After the bed has been thoroughly prepared, make drills at 15 inches apart and one inch deep, and sow the seeds thinly and evenly, making the surface moderately firm after the seeds are covered. To obtain very large bulbs sow seed in boxes fourth with to produce strong plants that will be suitable for transplanting in April. Fill the boxes with rich soil, which may consist of two thirds loam and one third decayed manure that has been passed through a 2 inch sieve. Scatter the seeds thinly, and cover them with fine soil. They should be germinated in a pit or house having a temperature of 60°. When the seedlings are about 3 inches high they should be transplanted carefully into boxes containing rich soil, and the boxes placed close to the roof glass. When the plants begin to mottle with admit air with caution to harden the plants gradually. They should be ready for planting in their permanent quarters at about the middle of April.

PEAS.—A hardy, quick maturing variety of Peas should be sown in a sheltered position out of the wind, where the soil has been previously prepared, sown and the Peas are two reliable varieties for early sowing. The first named is a variety sown at Farnham last season on the same date as Peas, and the pods were ready to gather several days in advance of that variety. The best time is one of the best about Peas for early sowing in the open. Those who prefer to sow in pots or boxes for starting out in April should sow the seeds thickly and germinate them either in gentle warmth in a cold house, cold pit, where the plants are partially exposed to the light. Ventilation is an important detail in their cultivation, as it is necessary to prevent them from becoming draught.

FRENCH BEANS. Make sowings of French Beans in pots on frequent occasions throughout the spring, in order to maintain a supply. Plants raised from a sowing made a month ago should be transplanted into fresh soil, and attend to the support of a few sticks. Syringe the plants freely on bright days in order to keep red spider in check, and water the roots with weak manure water from the farmyard. This crop should be grown in a house having a temperature of 60°.

TOMATOS. Tomato plants raised from seeds sown in January are ready for shifting singly into small pots. The soil for the purpose may consist of two thirds fine loam and one third leaf mould, and it should not be made very firm. Water the plants after they are potted, and place them close to the roof glass in a house having a temperature of 70°. Make another sowing to raise plants for successional cropping.

LETTUCE.—Seeds of Lettuce should be sown close to the glass in a cold frame in order to obtain sturdy plants that will be ready for planting by the beginning of April. Plants raised in previous sowings should be transplanted carefully in heated frames, allowing a space of 6 inches apart for small growing varieties, and 9 inches for the others. Autumn sown Lettuce growing in pots require ventilation when the weather is favourable. Stir the soil between

the plants on frequent occasions to prevent damping.

FRUITS UNDER GLASS.

By JAMES HUTTON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., P.O. Box, Gunpowder Square, Acton, W.

VINES IN OUTSIDE BORDERS. Where the vines are not being forced, presumably the borders will be still exposed. There is still time to give attention to the soil; indeed, I prefer this season of the year for lightly forking up and adding either a top dressing of fresh loam or a mulch of cow manure. Should the surface of the borders be somewhat below the ordinary level the addition of about 3 inches of tarty loam with a fair sprinkling of old mortar rubble would be beneficial. Rather less rubble would be necessary if the loam were of a calcareous nature. At the same time, if the vines show symptoms of weakness, or if the crop of the past season was not all that could be desired, reliable vine manure may be applied, but in no greater quantity than is recommended by the vendor. Such a manure should have a good percentage both of phosphates and potash; it should be applied before the fresh top-dressing of loam is added. It is better to do all this work when the soil is fairly dry; then, after having added the essentials, the border can be made fairly firm. A light surface covering afterwards of stable litter would be advisable. But if a dressing of cowyard manure is contemplated, I should not now add the artificial. In this case it should be well broken up, preference being given to manure that has been taken from a stack; this will be in better working condition. A dressing about 3 inches in thickness will be sufficient, and nothing else need be added now. Examine the drainage system wherever it is possible to do so, for a waterlogged border would make success impossible. Vines that are now starting into growth may possibly have their roots in outside borders. If so, a fairly thick covering of stable litter should be put over them. In most cases this will be ample. But if it be known that the border is too much on the wet side, then it may be covered with one of the brown or gray coverings so much in use in our gardens at the present time. If this precaution be taken a heavy fall of snow will, as it thaws, run off rather than into the border.

ORCHARD HOUSES. The spell of cold weather has kept back the early varieties of Peaches, Nectarines and Plums. This is an advantage where no early forcing is contemplated.

STRAWBERRIES. Another batch of Strawberries in pots should be brought under cover as soon as possible. In frosty weather they should be best put in a cold or hard house so that they may thaw gradually. When not frozen they should be dipped in sulphur before placing them in position for starting. Pay close attention to the watering of those started earlier, and do not let them suffer from drought. Two or three batches may now be got into a cold house, being drawn from thence as occasion may require for succession.

WEATHER CONDITIONS.—In no department of gardening is the present severe weather felt more than in fruit culture. Those who cultivate fruit in the neighbourhood of a large city or manufacturing centre where fogs prevail, are at a special disadvantage. In such circumstances it is a mistake to start too early, and better to depend upon making up leeway later on. The north-easterly wind, bringing temperatures frequently below freezing point, has necessitated an unusual amount of fire heat. This has created an aridity in the atmosphere that is not congenial to plant life. It is to be feared that it will bring about an early attack of insect pests, if a close watch be not kept. As soon as a shower of rain occurs an effort should be made to clean the glass on the outside. A fall of snow will also sometimes assist in this respect. In either case a light brush passed up and down the glass will clear it to a great extent. The additional light will be an advantage. Take every advantage of a sunny day to raise the temperatures somewhat, but do not attempt to do this by too much fire heat.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would oblige by obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPOINTMENTS FOR THE ENSUING WEEK

TUESDAY, FEBRUARY 13—

Roy. Hort. Soc.'s Coms. meet. Annual meeting of Fellows at 5 p.m.

THURSDAY, FEBRUARY 15—

Manchester Orchid Soc.'s meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 39.1°.

ACTUAL TEMPERATURE—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, February 8 (10.0 a.m.): Bar, 30.0°; temp, 33.0°. Weather—Bright.

SALES FOR THE ENSUING WEEK.

TUESDAY AND WEDNESDAY—

Clearance Sale of greenhouses, hot-water Piping and Nursery Stock at the Tumbidge Wells Nurseries, at 12 o'clock, by Protheroe and Morris.

WEDNESDAY

Balls, including Japanese Lilies, at 67 and 68, Cheapside, London, by Protheroe and Morris, at 2 o'clock.

Gardeners and National Service.

Gardeners of military age have already responded to the call of their country. Now

those of maturer years and those exempted on grounds of physical unfitness are asked to contribute their share to the national service. We are sure that the response of the older men will be no less creditable than has been that of the younger gardeners. Each man is called upon to ask himself whether he is now spending his working days in occupations of direct service to the community.

In many cases the question admits of a clear and certain answer, for in the large majority of establishments work connected with luxury gardening has been given up altogether, and the depleted staffs are spending their time in the essential work of increasing food production, together with the maintenance of rare and valuable plants, the neglect and destruction of which the President of the Board of Agriculture has pronounced to be undesirable.

Gardeners so occupied will have to ask themselves whether by remaining in their present positions they will be doing more or less than they might do in other employments. For our part, we think the answer which they arrive at ought to be determined by the answer to this other question, Is the amount of intensively cultivated land and glass under their charge so large as to require their individual services? If it is not, they will be answered out of their own mouths. If it is—if they are unrectly engaged in the production of as much food as it is possible for them to produce—they will regard themselves as having already voluntarily enlisted in the national service.

Head gardeners who have charge of large establishments will have the grave

responsibility of once again revising their judgment of what constitutes the irreducible minimum of assistance they require. They should, and must, endeavour to make use, even more largely than at present, of women gardeners, and thereby release such able-bodied men as may still remain on their staffs. Prejudices, if any remain, must be thrown aside, and head gardeners must be prepared to utilise the less skilful services of women who have been hastily trained, or have received no training at all. Such drastic changes, which would appear absurd in peace time, are a stark necessity now.

On the other hand, we trust that the authorities, on their part, will understand that it is a procedure of very doubtful wisdom to take a man engaged all his time in intensive cultivation, and skilled at that art, for another form of national service. The productivity of gardens exceeds that of the average farm three or four-fold, and where intercropping and successional cropping are practised, the difference is yet greater.

To ask skilled men already engaged in food production to exchange their work for general labour on a farm or in a factory is not, we hope and believe, the intention of the authorities.

Rather should it be their aim to see to it that every gardener should be an active propagandist and assistant in the work of cultivating vegetable food in the largest area of land in his immediate neighbourhood in which such cultivation is possible.

All gardeners should give heed and full consideration to Mr. Neville Chamberlain's appeal, and everyone from the age of 18 to 61 who is not honestly convinced that his energies are at present fully engaged in work of urgent national importance should forthwith become a volunteer under the scheme of the Director-General of National Service.

SEED POTATOS FOR THE COUNTY OF LONDON.

We are asked to state that the London County Council is prepared, on behalf of the Board of Agriculture and Fisheries, to procure seed Potatos for small cultivators in the County of London, and to arrange, as far as practicable, for delivery. The price of the Potatos will be 1s. 10d. for 14 lbs., or 14s. a cwt., and not more than 5 cwt. will be supplied to any applicant. The supply of any particular kind of Potato cannot be guaranteed, and early sorts are particularly scarce. Purchasers must, therefore, be prepared to accept seed, sound seed of any maincrop variety which may be available. Forms of application should at once be obtained from the officer-in-charge of the nearest of the Council's parks or open spaces, or from the Chief Officer, Parks Department, 11, Regent Street, S.W.

THE LATE LORD HARRINGTON.—The late Earl of HARRINGTON, of Elvaston Hall, Derbyshire, whose unfortunate death occurred a day or two ago, was greatly respected by all gardeners. For a quarter of a century or longer Lord HARRINGTON's indoor fruits, as grown and staged by his famous gardener, Mr. J. H. Goodeney, have secured most of the best prizes at the larger exhibitions, the Elvaston produce being always of very high merit. Moreover, Lord HARRINGTON himself became a professional horticulturist many years ago, when he opened a shop at Charing Cross for the sale of fruits and flowers from the Elvaston gardens.

SOCIETY OF WHOLESALE FLORISTS.—On January 17 last a meeting of wholesale florists was held in the Essex Hall, Essex Street, Strand, when it was resolved to form an Association. We are now informed that the secretarial duties of the new society have been entrusted to Mr. C. H. CURTIS, until recently editor of the *Gardeners' Magazine*; the address of the Association is No. 4, Tavistock Street, Covent Garden.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting of the Surveyors' Institution will be held in the Lecture Hall of the Institution on Monday, the 12th inst., at 5 p.m. A paper, on the "Defence of the Realm (Acquisition of Land) Act, 1916," will be read by Mr. EDWIN SAVILE.

MR. W. H. DIVERS.—On the occasion of Mr. W. H. DIVERS leaving Belvoir Castle, where he held the position of head gardener for twenty-three years, a pair of silver candle-ticks was presented to him by a number of local friends.

THE "POTASH-LIBERATING" EFFECT OF LIME.

Many of the soils in Southern California devoted to the cultivation of Citrus fruits being of granitic origin, it occurred to Messrs. BRIGGS and BRUCEVALE to ascertain whether lime produces upon these soils the effect usually ascribed to it, namely, the liberation of potash. The results of the authors' experiments and analysis are entirely negative, and they conclude that the "availability" to plants of the potash in soils derived from orthoclase-bearing rocks is not increased by the addition of lime or gypsum.

THE SALE OF ORCHIDS AT WALTON GRANGE—

The sale of the Orchid collection which belonged to the late Mr. THOMPSON, Walton Grange, Stone, has been fixed for the 24th inst., at Walton Grange. We understand that Mr. JAMES HOWES, who has had charge of this fine collection, will shortly seek another appointment.

SHOVELLING SNOW.—

To prevent snow from sticking to the shovel it is recommended first to give the tool a coating of paraffin. The paraffin will adhere best if both the lipid and the shovel, whether of metal or wood, are warmed, when the oil may either be flowed on or applied with a brush. If allowed to "set" before the shovel is used one application of paraffin will serve for a couple of hours' hard shovelling.

LEGACY TO A GARDENER.—

The late A. C. FRASER, of Mougwell Park, Wallingford, has left a sum of £1,000 to his gardener, Mr. JAMES FORBES. Mr. FORBES was at one time secretary of the Reading and District Gardeners' Society.

THE BELGIAN COMMITTEE.—

The Secretary of the Belgian Agricultural and Horticultural Committee informs us that his office has been transferred from 6, Grosvenor Gardens, to 15, Grosvenor Crescent, S.W.

FOOD PRODUCTION IN SCOTTISH PUBLIC PARKS.—

Fifty additional garden plots have been provided at Tollcross Park, Glasgow. There were one hundred applications, but it is hoped that those disappointed will be given ground at Belvedere Hospital. Plots have also been provided at the Alexandra, Newlands, Plantation, and Victoria Parks, and all the applicants have been provided for. In Dumbartonshire the Alexandra, Boxhill, and Jamestown Parks will each have plots provided for rat-payers wishing allotments. It has been agreed by the committee responsible to recommend to Edinburgh Town Council that 20 acres of Saughton Park, 55 acres of Portobello Park, and 30 acres of the Brair Hills Golf Course be ploughed and cropped. Maxwelltown Parks Committee has arranged for four fields for allotments. Dum-

"Availability of Potash in certain Orthoclase-bearing Soils as affected by Lime or Gypsum," *Journal of Agric. Research*, Washington, VIII, 1.

trix's Town Council has secured nursery ground at Irving Place for garden allotments.

STREPTOCARPUS ORIENTALIS (see fig. 23).—This handsome species of *Streptocarpus* is of considerable botanical interest, from the fact that it is the only known representative of the genus in Asia. It was discovered by Dr. A. F. G. KERR, growing on rocks by streams on Mount Dou Sui, near Chiengmai, Siam, at an altitude of 1,800 feet above sea level. Dr. KERR sent seeds to Kew in 1912, and from these seeds plants were raised which flowered in the following spring. The flowers are borne on slender pedicels, on a solitary, much branched, erect stem, from 12 inches to 18 inches high. The corolla is purple outside, pale within the tube, $1\frac{1}{2}$ inch to 2 inches long, the limb being from $\frac{3}{4}$ inch to 1 inch across. The ovate, toothed leaves are from $1\frac{1}{2}$ inch to $3\frac{1}{2}$ inches long, and from 1 inch to 3 inches broad. The plant dies after flowering, but seeds ripen freely, enabling a supply of young plants to be obtained easily. The seeds should be sown in February, and the seedlings grown in a stove temperature. The plants commence to bloom the following September, when they should be placed in a cooler and drier atmosphere. In suitable conditions they will continue to flower freely for at least three months. As with other species of *Streptocarpus*, *S. orientalis* thrives in a light, rich compost. The plants should not be over-potted; good specimens may be grown in pots 5 inches in diameter. During the summer the plants should be placed in a shaded, moist position near the roof-glass. At this stage they should not be syringed overhead, but they should be given a liberal supply of water at the roots.

WAR GARDENING PAMPHLETS. Those who respond to the appeal to grow as many vegetables as possible will have no lack of guidance. Besides the advice in the horticultural journals and in the columns of the daily press, large numbers of excellent pamphlets are being issued from various sources, among others from firms of seedsmen. Messrs. STATION'S pamphlet is terse and clear, and describes in alphabetical order the chief garden crops. The instructions are excellent, and amateurs will in particular find the table for sowing and planting of great assistance. Messrs. AUSTIN and McALHAN'S pamphlet is on similar lines, and has been drawn up primarily for the use of Scotch amateur gardeners. Besides instructions in the growing of the several crops it contains useful hints on the choice of soil and manures.

VISITORS TO KEW. During the year 1916 713,922 persons visited Kew, the total receipts from admission fees during the period January 17 to December 31 (both dates inclusive) amounting to £5,792 13s. 6d.

MR. E. H. WILSON. Mr. WILSON is arranging a sixth journey to the East for the purpose of collecting plants. On this occasion he will explore the floras of Corea and Formosa.

WAR ITEMS.—Sergeant C. H. ANDERSON, of the London Scottish, and formerly a member of the garden staff at Kew, lost his life by an act of gallantry. An ignited bomb fell in the dug out where he and others were gathered; Sergeant ANDERSON poked it up and pushed to the door, but before he could dispose of it the bomb exploded, causing injuries from which he died an hour later. He enlisted in August, 1914, but an accident during training necessitated an operation, and he did not proceed to the Front until November, 1916.

—Captain CHARLES DUDLEY, an old student of Kew, and of the French National School of Horticulture, has been for a second time "cited in the Order of the Army," and has received

* *The Culture of Profitable Vegetables in Small Gardens*. By AUSTIN & SONS, London.
Allotments and Small Gardens in War-Time. Published by Austin & McAlhan, Glasgow.

the Cross of St. Anne of Russia for acts of conspicuous bravery in the field.

THE WAR LOAN.—Amongst the subscribers to the new War Loan we notice the firm of Messrs. EDWARD WEBB and SONS, SPURRINGBRIDGE, LTD., for the sum of £20,000.

THE FROST.—The prevailing frost appears to be more severe in the Midlands than in the more northern parts of the country. Thus 6° below zero, 38° Fahr. of frost, were recorded at Market Harborough during Sunday night. According to a correspondent, Mr. G. H. SIBBICK,

old-time gardener of the town, 54° or 55° Fahr. was recorded.

BULB-GROWING ON THE PACIFIC COAST.—It is claimed by Mr. J. W. VAN ALSTED, who is engaged in the bulb-growing industry in California, that bulbs grown on the Pacific coast are superior to those raised in Holland. How much farther the water has to be hauled is indicated by his statement that next year's planting in his nursery will be increased from 7,000,000 to 10,000,000 bulbs, and that he will import only from 5,000,000 to 7,000,000 from Holland, the rest to be raised at home.

FIG. 23. STREPTOCARPUS ORIENTALIS. Photograph by C. P. Rolph.

LAND, the temperature at the Gardens, Alden Hall, Longroy Mill, Derbyshire, was 4° Fahr. below zero on the morning of February 5th. Mr. KENNEDY, Norton Priory Gardens, Runcorn, states that on the morning of the 6th inst. the reading there was 5° Fahr., or 29° of frost.

BULBS IN COLD STORAGE.—The temperatures at which it is found best to keep "bulbs" in cold storage* are for Lily of the Valley, 28° Fahr., i.e., 4.6° below freezing; but for Hyacinths, Tulips, Camas, and particularly Gladi-

THE LOCAL SOCIETIES.—The Chester Paxon Society has appointed a sub-committee, consisting of Mr. N. F. BARNES, gardener at Eaton Hall; Prof. or Prof. or BOMER, Newstead, Mr. A. W. ARMSTRONG (Messrs. McHAYLE and Co.), and the hon. secretary, Mr. G. P. MILN, to advise allotment holders and others as to the best and most practical methods of vegetable culture. The society will offer cultural certificates, and probably prizes, for the best equipped and most neatly kept garden allotments. Mr. BARNES is preparing a pamphlet giving prac-

* See *Cult.* a monthly pamphlet on cold storage published at Ocala, N.Y., and quoted in the *Florida Exchange*, Jan. 29, 1917.

tial hints on gardening subjects, which will be supplied free of charge to applicants.

— Fruits, flowers and vegetables exhibited at the meetings of the Twickenham Gardeners' Association in 1916 have been given, in almost every case, to St. John's Hospital. The profits of the annual exhibition, amounting to £5 5s. 6d., have also been handed to that Fund. The society is arranging to hold a special vegetable exhibition in 1917.

— Lee and Lewisham Horticultural Society has given the profits of the year's working, amounting to £10 15s. 10d., to St. John's Hospital. The society has affiliated with the local land cultivation society, and is in negotiation for land to be let in plots at a nominal rental. The society has lost, by death, a valued officer, in the late Mr. T. Atroy, who had been a member for over thirty-five years, and secretary since 1911.

AMERICAN NOTE.

NEPHROLEPIS VARIETIES AT THE BROOKLYN BOTANIC GARDEN.

In your issue for December 18, 1915, p. 584, you published an account of the *Nephrolepis* collection at the Brooklyn Botanic Garden, together with a suggestion I made for a means of co-operation between the Garden and florists which would be of mutual benefit. The offer made on behalf of the Garden was to send out small plants of named varieties from a list then published as far as duplicates were available, the purpose being to aid florists in building up collections and testing new varieties. Second, the Garden offered to act as a bureau of information regarding these Ferns, and, in this connection, offered to send out copies of a reprint of the *Nephrolepis* article from the *New Standard Cyclopedia of Horticulture*. Florists were asked in return to send information to correct or supplement the statements in the article, and also to send plants of varieties not on the list. The present statement is in the nature of a report on the results obtained, with a further offer of co-operation on the same lines as before.

About two hundred copies of the *Nephrolepis* article have been sent out, the great majority to commercial growers. Several hundred small plants have been distributed in lots varying from five to thirty different sorts, according to what was available. These have gone to all corners of the United States, and applications have come from Australia and New Zealand. A considerable number of florists have thus been able to build up collections for exhibition purposes.

The *Nephrolepis* investigation work at the Garden has also profited. The collection of *Nephrolepis* forms has more than doubled. The list previously published included forty named sports of *N. exaltata* *hastoniensis*. The present list includes seventy. Of varieties of other species, fifteen names were given before. Now there are fifty names. It should be noted that I say "fifty names," not fifty varieties. Some of these names are undoubtedly synonyms. The list of actually distinct forms may not be more than thirty, but it is yet impossible certainly to determine the proper names for these varieties or the exact number of different sorts. The difficulty in correctly classifying these forms is due in part to carelessness and inaccuracy on the part of the growers and others and in part to the fact that the classification of the original species of *Nephrolepis* is an unusually difficult problem.

Besides the named varieties at least fifty unnamed sorts have been sent in for experimental

growing. When full grown plants of all varieties are developed it will be found that some of these unnamed forms are duplicates of varieties already in the trade. It is safe to say, however, that the present living collection at the Garden includes at least one hundred and twenty five distinct varieties of *Nephrolepis*.

About thirty of this increase of sixty-odd sorts have been obtained by purchase from English and French growers. The remainder have been received through the co-operation of American growers and botanic gardens. The Bureau of Plant Industry, through its Office of Foreign Plant Introduction, is now co-operating through its agents in all parts of the tropics, who are collecting specimens of the wild forms to be grown and compared with the types under cultivation.

The writer has continued his visits to commercial establishments through the aid of a grant of one hundred dollars from the American Association for the Advancement of Science. Growers in Columbus and Springfield, Ohio, and in and about Boston, New York and Philadelphia, have been visited, some of them several times. A great deal of valuable information has been gained in this way. A scientific report of the study of these plants has been published in the May number of the *Bulletin of the Tarry Botanical Club*, and reprinted as contributions No. 15 of the Brooklyn Botanic Garden. Further reports are in preparation.

In the meantime, the facilities of the collection continue to be available for the benefit of florists. Small plants of named varieties will be sent on application so far as the stock of duplicates allows. Definite applications for few and specific varieties will receive preference over general application, but all will be served as far as possible. If general applications are made for the purpose of building up collections of varieties, the request for specimens should include a list of the sorts already being grown, to avoid duplication.

Not all the varieties listed here are available for distribution, although there is a much larger assortment than last year. Some have only recently been received from England, and there has been insufficient time for propagation of small plants. Others, especially some in the second group, are very slow to propagate, or are so large and require so much space that it has not been possible to give them bench room. In general, the varieties in the second group are mostly of little commercial value in the United States except for large collections.

Perhaps the collection can find its greatest value for florists as a clearing-house of information about *Nephrolepis* forms. How this might work out was suggested recently by a well-known grower, of the New York district. As president of one of the local growers' associations, he had had occasional requests for an opinion as to the value and distinctiveness of some supposedly new form of *Nephrolepis* sent in by some florist of the district. The only means of answering such a question would be by reference to some practically complete collection of these forms. The writer will be glad to answer questions along this line and regarding any other phase of interest in connection with these Ferns. Visitors are welcome at any time.

* Produces some 2-pinnate leaves.
† As typically developed, 3-pinnate.

- ping variety, but the quality is not very good.
- 6 *Great Spot* (McAlister).—One of the best of the second early varieties. It is later than King George, and might even be regarded as an early maincrop. The haulm is tall, upright, and vigorous. The foliage is dark green and glossy. The flower is white. The tubers are round with moderately deep eyes. The skin and flesh are white. It is a very heavy cropping variety, and the quality is good.
- 7 *No Douglas Hay* (Sands).—Indistinguishable from Great Scot.
- 8 *Southampton Wonder* (Tosgood).—Indistinguishable from Great Scot.
- 9 *The Duchess* (Dobson).—The haulm is moderately vigorous and spreading. The tubers are round, skin white, flesh white, and eyes rather deep. It crops well.
- 10 *The Ally* (syn. The Allies).—Haulm vigorous and spreading. Flower white. The tubers are usually oval, but the shape varies. The skin and flesh are white; eyes shallow. It is a very heavy cropping variety, but the quality is only fair.

LATE OR MAINCROP VARIETIES

- ABUNDANCE TYPE. Nos. 12 to 13 resemble Abundance in most respects.
- 11 *Abundance* (Sutton).—An early maincrop, with strong upright haulm and dark green, glossy foliage. The flowers are white. The tubers are round to oval, and flat. The skin and flesh are white and the eyes shallow. The cooking quality is good. The variety crops well, but it is rather liable to the common Potato disease (*Phytophthora infestans*).
- 12 *Callies Castle* (G. R. Sharp).—An early maincrop which resembles Abundance.
- 13 *King Albert* (Sands).—An early maincrop which resembles Abundance.
- 14 *The Princess* (Dobson).—Of the Abundance type.
- 15 *Crofter* (Dobson).—Of the Abundance type.
- 16 *Joanna Deans* (Finlay).—Of the Abundance type.
- 17 *Favourite* or *Impaired Favourite* (Dobson).—A well known variety of the Abundance type.
- 18 *Twentieth Century*.—Resembles Abundance.
- THE ADMIRAL TYPE. 19 and 20.
- 19 *The Admiral* (Dobson).—An early maincrop with a tall, strong, upright haulm which becomes more spreading towards the end of the season. The flowers are white. The tubers are flatish-round with shallow eyes. The skin and flesh are white. The variety yields a good crop of moderate size tubers.
- 20 *Barnhouse Beauty*.—This variety does not appear to be so vigorous as the Admiral, and the foliage is inclined to curl. The flowers are lavender and white. The tubers are round or piddish-shaped. The skin and flesh are white and the eyes shallow.
- 21 *The Laird* (Davies).—A maincrop with a vigorous haulm and purple foliage. The tubers are round, larger than Admiral. The variety crops well on certain soils in many Midland districts.
- LANGWORTHY TYPE. 22 to 24.
- 22 *Langworthy* (Nixon).—A late maincrop with tall, vigorous, upright haulm. The leaves are slightly crinkled. The flowers are mauve tipped white. The tubers are kidney-shaped, often tapering at the "heel." The skin and flesh are white and the eyes shallow. It crops well on some soils, but it requires a long season of growth and good cultivation. If possible, the "seed" should be sprouted. The quality is excellent.
- 23 *Walt's Wanted* (Nixon).—Resembles Langworthy.
- 24 *Golden Wonder* (Brown).—The haulm, foliage and flowers are practically identical with those of Langworthy. The tubers are kidney-shaped, often tapering at the "heel." The skin has a characteristic yellowish-russet brown tinge. The flesh is white and the eyes shallow. The quality is excellent. The variety crops well on some of the soils of Lancashire, and it is one of the best late-

keeping varieties. It requires a long season of growth, and if possible the "seed" should be sprouted. Not suited for heavy soils.

WHITE ROUND OR OVAL SECTION.

- 25 *Rob Roy* (McAlister).—An early maincrop with a tall, vigorous haulm, inclined to spread. The tubers are flatish oval, with very shallow eyes. In size they are medium. The variety crops moderately well.
- 26 *The Lochan* (Farish).—Haulm of medium height and vigour, upright, with fine branches. The foliage has a characteristic delicate shade of green. The tubers are round, with eyes of medium depth. The skin is white, with a faint tinge of pink, especially around the eyes. The flesh is white. This variety yields a heavy crop of medium-sized tubers. Appears fairly resistant to common Potato disease (*P. infestans*).
- 27 *Woolley Bountiful*.—Resembles Lochan.
- 28 *Leicester Wonder* (Sands).—A very late maincrop, with a tall, upright, vigorous haulm and dark green foliage. The flowers are white, borne on long stalks. The tubers are round, with a white skin sometimes showing a faint trace of pink. The eyes are shallow. The flesh is white, tinged lemon. The variety crops well and appears to be fairly resistant to common Potato disease (*P. infestans*).
- 29 *The Templar* (Wilson).—A late variety with a very vigorous, tall, upright haulm and dark green foliage. The flowers are white and very numerous. The tubers are flattened oval, with eyes of medium depth. The skin is white and the flesh white. The variety yields a heavy crop of medium-sized tubers of very good quality. It appears to be fairly resistant to ordinary Potato disease (*P. infestans*).

COLOURED ROUND OR OVAL SECTION.

- 30 *Kerr's Pink*.—A late variety with a very strong, tall, upright haulm. The flowers are white and usually numerous. The tubers are round, with a light pink skin. The colour is so slight that it will not detract from its market value. The eyes are usually of medium depth, but on some tubers they are deeper. The flesh is white and the quality excellent. The variety yields a very heavy crop of good-sized tubers. It also appears to be fairly resistant to ordinary Potato disease (*P. infestans*).
- 31 *The Border* (Wilson).—Tall, upright, strong haulm, with darkish green foliage. Flowers rose purple, tipped white. The tubers are round, with rather deep eyes. The skin is red and the flesh white. It yields a heavy crop of medium-sized tubers which are of excellent quality. The variety appears to be highly resistant to ordinary Potato disease (*P. infestans*). Its colour will probably detract from its value as a market potato, but it can be thoroughly recommended to growers who require a good-keeping potato of first-class quality.
- 32 *Lish Queen* (Sands).—A main crop, with a tall, vigorous, upright haulm, and large medium green leaves. The flowers are purple. The tubers are round, with a pink skin and very deep eyes. The crop is fairly heavy, and the variety will keep late.
- 33 *Sherlock* (Sands).—A very late variety, with moderately vigorous, tall haulm, which becomes spreading at end of season. The foliage is dark green. The flowers are white and usually numerous. The tubers round, rather rough in shape, with a reddish pink skin. The eyes are numerous and deep and the flesh white.
- 34 *White City* (Sutton).—A variety with tall, vigorous upright haulm, usually with three or four strong branches. The foliage is darkish green. The flowers are large, tipped a lighter shade. The tubers are long, flat, kidney-shaped, and tapering, with very shallow eyes and a russet skin. The flesh is white and the quality good. The variety crops well. Unfortunately many of the stocks of this variety are very mixed, gene-

rally with a smooth-skinned variety very susceptible to wart disease.

- 35 *St. Malo Kidney*.—The haulm is tall, upright and strong, and the foliage dark green. The tubers are kidney-shaped and large, with shallow eyes. The skin and flesh are white. The variety crops well, but it is advisable to sprout the "seed" before planting.
- 36 *Dominion* (Pond).—A late variety with a tall, vigorous, somewhat spreading haulm, with dark green foliage. The flowers are white. The tubers are flattened oval, often elongated, in many respects resembling the tubers of the Up-to-Date. The skin and flesh are white and the eyes shallow. The variety crops well.

There are several other immune varieties for which approval may be obtained if desired, such as

SECOND EARLY VARIETIES

Aberlady early, Mr. Bresse, Border Queen, Snowball, Entente-Cordiale (Finlay).

LATE VARIETIES.

Supreme (Sutton), Flourball (Sutton), Adiron dack.

Occupiers of wart disease infected premises are reminded that it is illegal to plant any Potatoes on their premises, whether of the above-named varieties or not, except with the licence of the Board of Agriculture and Fisheries.

The following varieties are highly susceptible to wart disease of Potatoes and cannot be planted on infected premises:—

Early Puritan, Epicure, Midlothian Early, British Queen, Duke of York, Sharpe's Express, Sharpe's Victor, Sir John Llewellyn, Evergood, Cona, Cigarette, King Edward VII., Up-to-Date, Dalhousie, Duchess of Cornwall, Ayrton Chief, Factor, Prolific.

CROPS AND STOCK ON THE HOME FARM.

POULTRY.

If all who manage a farm would keep a reasonable number of fowls of the best breeds and manage them sensibly poultry would be found to pay very well. Too many persons think if they cannot obtain a full supply of eggs during November and December by very little trouble and expense the fowls are not worth looking after. Close to where I write a village policeman last year made £8 from his few hens, kept in the backyard and a part of the garden attached to his house. The common fault of inexperienced poultry keepers is that of overcrowding. Far better keep fewer birds and attend to them properly. For the winter production of eggs the semi-intensive method of management is the most satisfactory. Ten March or early April hatched pullets, with one year old male bird, in a house 12 feet by 10 feet, will give better results than three times the number kept in unfavourable conditions, such as too little space, tainted soil, want of exercise, and indifferent feeding.

HATCHING CHICKENS

For early February and March hatching in quantity an incubator is a necessity, so difficult is it at that time to obtain broody hens. An incubator of the best make, properly managed, ensures success, with good eggs, provided the directions issued with the incubator as to temperature and the manipulation of the eggs are correctly followed. With an incubator a foster mother is a necessity. Ducks and turkeys also can be equally well hatched in an incubator.

Many are apt to think the hatching of chickens under hens involves no risk. The nests should be made with soil on the ground in the open, protected from cold wind, wet, and hot sun during May and June. Setting the hens on eggs on the ground ensures a regular supply of moisture to the eggs by the aid of capillary attraction, which dispenses with the necessity of damping the eggs daily, as must be done when the nests are made on a dry floor.

During a spell of dry weather in April or May, a week before the date of hatching, the eggs should be sprinkled with tepid water every morning immediately before the hens return to their nest, after being off the allotted quarter of an hour for food and water. Early in the year twelve eggs are sufficient for a hen to cover properly; later, when the weather is warmer, fourteen is not too many. A common mistake is that of putting the eggs under the hen the moment she shows signs of broodiness. All hens do not take to the eggs at once—some will sit on them two days, when, through no apparent cause, they will leave the nest, and eggs so treated are generally useless. The correct method is to set the hen for three days on false eggs before committing good eggs to her charge. The hens should be taken off regularly each day for food. If this detail is attended to irregularly the hens, after a stated time, become restless, and often are found standing up off the eggs waiting to be released. In this way, if nothing worse happens, the outer eggs become unduly cold, making the hatching irregular, and may spoil the lot. As each hen is lifted from her nest she should be tethered to a stick thrust in the ground, a loop passing round one leg. Such a method as this must be practised where a number of hens are sitting together. Some person may say, "What difference does it make which nest a hen returns to?" All hens are not of the same body temperature, and as eggs require regularity of temperature it will be seen how important it is that each hen has her own nest continuously. Maize is the best food for sitting hens, as it provides the most warmth from food. Clean drinking water, too, is important.

BEANS FOR CATTLE.

The common Horse Bean (*Faba vulgaris*) when split, is excellent for horses in hard work, fed with Oats and chaff. Bean meal is capital for fattening stock, as it is rich in nitrogenous as well as starchy foods. For cows in milk a little with the cake ration adds richness to the milk. For lambs fattening after they are three months old split Beans give a great fillip to other foods for putting on flesh. The best Beans are grown on heavy soil, say following a Wheat crop, and, if not wet, land should be sown in October, and the crop is then ready for harvesting sooner than the spring sown crop, which is known as the Spring, or Lark Bean. The winter Bean is smaller than the spring variety. If the soil is light in character the winter variety should be sown. The yield per acre is uncertain; five quarters is good; adverse weather—drought especially—may reduce the amount to six sacks per acre. Good Beans should give 64 lb. per bushel, 2½ bushels per acre is required for seed. The land should be deeply ploughed in the autumn and well cultivated in the spring for the summer variety. There are many methods of sowing Beans. Broadcasting is easy, but prevents being afterwards. Drilling the seed deeply 18 inches wide is the quicker method. Dribbling the Beans two in a hole is also a good plan. *E. Molington*

SPRING WHEATS.

The Royal Agricultural Society of England, on the recommendation of the War Emergency Committee appointed in December last, has issued a leaflet prepared by the Botanist of the Society—Professor R. H. Biffen, F.R.S.—giving advice to farmers in connection with the sowing of spring Wheats. The society states that the question is one of great importance in view of the country's requirements in the matter of food supply, and hopes that advantage will be widely taken of the information which has been prepared to assist agriculturists in maintaining the maximum growth of Wheat. Copies of the leaflet can be had on application to the Secretary, Royal Agricultural Society of England, 16, Bedford Square, London, W.C.

Obituary.

CHARLES ROSS.—It is with regret that we announce the death of the veteran gardener, Mr. Chas. Ross, whose work in raising new fruits, principally Apples, has obtained for him wide fame. He died at Westgate-on-Sea on the 4th inst., aged 92 years. Mr. Ross was for many years gardener at Welford Park, Berkshire. He was born on the Dalmeiy Estate, Midlothian, where his father was head gardener to the then Earl of Rosburgh. He was employed in early youth at Messrs. Dickson and Sons' nursery, Edinburgh, and in several private gardens, notably that of Dalkeith. His first position as head gardener was at Fairhawn, Tonbridge, Kent, where he remained for six years. In 1860 he went to Welford Park, where he remained until 1903, when he retired. Deceased attained wide fame chiefly in connection with the raising of new Apples. It was about 1826 that his famous cross between Cox's Orange Pippin and Peasgood's Nonesuch was effected, and from that cross have been obtained several very fine varieties, including Charles Ross, a beautiful Apple, which worthily perpetuates the raiser's

THE LATE CHARLES ROSS, A.M.I.

name. Its original name was Thomas Andrew Knight, under which title it received an Award of Merit from the R.H.S. Some years after the name had been changed to Charles Ross it obtained a First-class Certificate. Immediately before the granting of the latter award, the variety received 1st prize for flavour in a class for dessert Apples at the R.H.S. Fruit Show. From the same cross came The Houbdon, Royal, and Renown, three superb Apples. Other excellent Apples raised by Mr. Ross are Paragon, famed for its luscious colour; Hector Macdonald, a seedling from Lane's Prince Albert; Encore, from Warner's King and Old Northern Greening; Excelor, from Peasgood's Nonesuch and Duke of Devonshire, a fine, roundish Apple, with a small oval at the stem; and many others not so well known. Altogether Mr. Ross obtained for his seedlings three First-class Certificates and ten Awards of Merit.

ALFRED HEMSLEY.—We regret to record the death from cancer in the throat of Alfred Hemsley, which occurred at his residence, Wistaria Road, Lusham, on the 50th ult. He was born on January 7, 1851, so that he had completed his 66th year. He commenced his gardening career in a general market garden nursery at Haslemere, Sussex, where his father was manager. He passed through the various departments, and became well grounded in practical knowledge and especially in the forcing of Grapes, Peaches and

Cucumbers. He entered the R.H.S. Gardens at Chiswick in 1876, and was soon promoted to the position of foreman plant grower, and his skill as a grower and his taste in displaying his plants, both in the conservatories and at the shows, was generally acknowledged. He left the R.H.S. in 1902, and after a short engagement at the residence of the secretary of Mr. H. E. May, Edmonstone, with whom he remained until 1909. His name is well known as a Fern grower was well known in the trade as Mr. Hemsley wrote articles for the Horticultural Press for many years, and from 1903 he devoted himself entirely to the literary side of his profession. Besides contributing to English journals, including the *Gardener's Chronicle*, he wrote for the *American Florist and Flowerer's Exchange*, and was author of the *Book of Fern Culture*, of John Lane's series of "Handbooks," and joint author with Mr. John Fraser of an edition of *Johnson's Gardeners' Dictionary*, which has been published only a few days. About 1910 his health failed, and he accomplished little work after that. He married in 1885, and leaves a widow, three daughters, and two sons, the younger of whom is a second lieutenant in the 15 London Regiment. Mr. Hemsley was an enthusiastic cultivator of Carnations, and his familiarity with the various branches of market gardening was exceptional.

RICHARD J. DONAVAN.—The *American Florist* announces the death of Mr. Richard J. Donovan, a florist of Chicago, which occurred on January 3 last. Mr. Donovan was born in Cork, Ireland, in 1843, and was employed for a time in London nurseries. He settled in the United States in 1871, at Philadelphia, and later moved to Chicago, where he was first employed in the Ros Hill cemetery. In 1879 he started a commercial establishment on Ravenswood Avenue, where he built up a prosperous business.

H. WITTE.—M. H. Witte, whose death is announced in the Dutch Press, was born in 1829. He became curator of the Botanical Garden at Rotterdam, and was transferred in 1854 to Leiden Botanical Gardens, where he remained till his retirement in 1893. He was succeeded at Leiden by his son, M. E. T. H. Witte, who is still in office there. Deceased, who died on January 9 ult., in his 83rd year, was a corresponding member of several horticultural bodies, including the Royal Horticultural Society (London). He played a prominent part in the creation of many Dutch horticultural associations, and although he was deaf and nearly blind in his later years, he continued a contributor to the horticultural Press until a few days before his death.

DR. N. H. J. MILLER.—Dr. Miller, whose death took place on January 12 at Harpenden, had worked at Rothamsted for 50 years. One of his main investigations, described in the course of a sympathetic obituary notice by Dr. E. J. Russell, consisted in demonstrating, by analytical measurements of the amounts of ammonia in rain, the falseness of Liebig's assertion that plants derive their nitrogen from the ammonia brought down in rain. Dr. Miller also made important contributions to our knowledge of the quantity of nitrogen lost to the soil in drainage water, showing that land loses nitrogen in the form of nitrates at the rate of from 35-40 lb. per annum.

FRANK SOMERFORD. We learn with regret that Mr. Frank Somerford died on the 26th ult. at Bromsgrove Cottage Hospital. Mr. Somerford was a native of Kent, and he started his gardening career in a nursery at Deal. Afterwards he was appointed foreman at Charlton House, Kent. Later, for twelve years, he held the post of gardener to the late Mr. Bittie Wrightson, Gosworth Hill, Doncaster, and from 1897 to 1904 was gardener to the Rt. Hon. the Earl of Shrewsbury and Talbot at Ingestre Hall, Stafford. In recent years he was engaged in business on his own account.

MONSIEUR E. T. TOURET. Monsieur Eugene Toiret, the well-known French landscape gardener, died at Paris on January 29 after a long illness. M. Toiret's son Eugene, Chevalier of the Legion of Honour, who follows the same profession as his father, was for some time a student of the R.H.S. Gardens, Wisley

THE PUBLISHER,

THE "GARDENERS' CHRONICLE," LTD.,

11, WELLINGTON ST., COVENT GARDEN, LONDON, W.C.

THE HORTICULTURAL DIRECTORY AND YEAR BOOK.

We much regret that the publication of the Horticultural Directory and Year Book for 1917 has been delayed by unforeseen and unavoidable circumstances. First, the difficulties in regard to printing and paper supplies have increased greatly of late; and secondly, the number of corrections that have to be made this year is altogether unusual, owing to the fact that so many gardeners have joined the Army. To those who have already sent us prepaid orders we offer our apologies for the delay, and assure them that everything possible is being done to expedite publication.

GARDENERS' CHRONICLE, Ltd.,

41, WELLINGTON STREET, COVENT GARDEN.

LONDON, W.C.

SEEDS FOR 1917.

It is none too early for garden lovers to think of seeds, but be sure the seeds you buy are seeds of quality. It is a gardening axiom that

RYDERS SEEDS

are the best, and despite the fact of a War Time price of 14d. per packet, orders for these famous Flower and Vegetable Seeds are daily growing in volume. Seeds of quality cannot now be supplied, even by Ryders, in Penny Packets.

Ryders Illustrated Seed Catalogue Free.

Ryders 1917 Catalogue contains a large number of choice varieties not found in other lists.

Ryders offer in 1std. packets such standard novelties as :—

Tomato Bide's Recruit, 8 seeds for 1std.

"All the Year Round" Cauliflower.

The New Chinese Celery-Cabbage "Pe Tsai."

Kychnis Arkwrightii.

Calecularia Veitchii.

New Double Cosmos, pink and white.

Such Sweet Peas as Jean Ireland, President, Fiery Cross, The Lady Eveline, Yarrowa, and over 200 others.

Send a post-card to-day for your free copy of this Catalogue. Remember the one and only address and beware of imitators—no agents.

NOTES FROM A GALLOWAY GARDEN.

CONTRIVANCES for the dispersal of seed are so manifold, so ingenious, and so effective in most plants, that one cannot but be puzzled by the mechanism in the various species of Cyclamen, which almost seems to have been devised as a hindrance to dispersal. No sooner does the flower fade than the peduncle coils itself spirally, tucking away the fruit tightly against the spherical root-stock. As the said root-stock often increases to a breadth of six or eight inches, most of the ripe seeds are discharged on its flattened top, germinate there in a crowded clump, and, if left alone, generally die of congestion. Is it possible that in the Mediterranean region, whence most of the hardy species have come to us, Cyclamens depend for the dispersal of their seeds on the intervention of ants or other insects? Swine are said to be very fond of the aerial root-stock (whence the English name "sow-bread"), and no doubt they scatter the seeds when rooting out the roots; but this seems an auxiliary too fortuitous to be trusted for sure propagation of the plant.

Whether in flower or in leaf, the beauty of both spring and autumn Cyclamens is so fascinating that it is strange that they are so comparatively seldom grown. No one who has seen the autumn display under the trees at Westonbirt, or the spring bloom on the roadside banks at Trenough, but must have envied the owners of these places. It is in the power of any owner of a garden to enjoy the like, for all that these hardy little plants require is good drainage, some lime in a poorish soil, and freedom from competition with rank vegetation. Even rats and mice leave the roots alone. It is certain, however, that much disappointment has been incurred in planting purchased roots. Rootlets are thrown out chiefly from the upper part of the tuber-

like stock, wherefore one is very apt to condemn the plants to a lingering death by planting them upside down. I speak feelingly, having sacrificed many Cyclamens to this blunder years ago. To-day I have been saving the lives of scores of seedling *C. europæum*, the offspring of flowers that bloomed in the autumn of 1915. Each of them consists of a tiny, translucent globe, with a few root fibres and a miniature leaf. All would have perished had they been left clustering on their parent's corky bosom; but, being pricked on the barish ground under a Pine tree, with some sifted fine rubbish added to the soil, they may be trusted to make a pretty display a couple of autumns hence. I have described this species as *C. europæum*; we used to call it *hederacifolium*, a most appropriate name, so near is the resemblance of its leaves to those of some forms of Ivy, and I know not how to distinguish it from *neapolitanum*. Most of our plants have rose-coloured blooms, descended from parents which I grubbed out of a loose stone wall near Ragusa, in Dalmatia; but a seedling with pure white flowers sprang up at the edge of a gravel walk, and has produced a numerous progeny of the same colour. Gerard tradeth this innocent plant, declaring that it was most injurious to women in delicate health. "About the place where it groweth in my garden," he says, "I have fastened stakes in the ground, and some other stakes, I have fastened also crosswires over them, lest any woman by lamentable experiment find my words to be true by their stepping over the same."

I had written so far before the mercury tumbled down at the end of January with the severest frost that we have experienced since 1895. In that memorable winter a thick mantle of snow protected vegetation; there is none now, and the danger to tender things is aggravated by splendid sunshine, which thaws frozen shoots and redoubles the risk; so we must prepare to put up with some loss.

The mischievous effect of sunshine upon frozen plants is well shown to-day (Feb. 1) by *Rhododendron barbatum*. This fine species protects itself against frost by rolling its leaves backwards upon their midrib, so tightly that they look like a lot of very dark green pencils. That was the aspect presented by a fine bush about nine feet high at 9 a.m.; it had then little resemblance to an evergreen; but now, about midday, the sun has beguiled it, the leaves are as broad and green as they are at mid-summer, and the whole process has to be gone over again. Others of its kind, protected by trees or a north exposure from the sun, remain in an attitude of defence. Moral: plant the choicer early-flowering *Rhododendrons* where the sun of February will not strike them.

It is interesting to note the attitudes of defence against cold adopted by different evergreen species of the genus *Rhododendron*. Taking two of the largest-leaved species, *R. Hodgsonii* presents a most singular appearance, rolling back its magnificent leaves, eight to ten inches long, into narrow cylinders, whereas *R. Falconeri*

folds them not at all, but simply hangs them vertically. *R. Stairnovii*, *caucasicum*, *ponicum*, *pachytrichum*, also hang their leaves uncurled; *R. Thomsonii* and *arborescens* depress them, but while the former curls them moderately backward, the latter advances the outer margins. Of the smaller-leaved species, *R. emmabarinum* behaves like *R. barbatum*; but *R. indicum*, *ciliatum*, *glaucum*, *hirsutum*, and *ferrugineum* do not alter the position or form of their leaves with the mercury at 18° Fahr.

Pieris (*Andromeda*) *formosa* meets frost by depressing its leaves and curling the outer margins forward; while *Myrtus Lunna*, strange to say, sets its leaves upright and contracts the margins.

There is no more beautiful object in the garden at present than *Pieris japonica* (see fig. 24), thickly set with clustered racemes of ruddy flower-buds, which in the bright sunshine are nearly as showy as the alabaster blossoms which they contain will be presently. It is a pity that this shrub is not more commonly planted, for it is infinitely more lovely than the pallid *P. floribunda*, which one meets constantly. *P. japonica*, however, demands choicer lodging than the other, for it is impatient of cold winds.

This frost has put an end, for the nonce, to the flowering of *Abutilon vexillarium* (by the by, we are enjoined now, for some occult reason, to speak of it as *A. megapotamicum*). Of all shrubs known to me, this is, I think, the most persistent bloomer. Give it a place against a warm wall facing south—if it is the wall of a greenhouse or stove-house, so much the better—and this Chilean beauty will never be without some of its scarlet and yellow tassels, except when these get frozen to death. I saw it first in Mr. Gerald Loder's garden at Wakehurst Place, and retain a lively sense of gratitude for the cuttings he bestowed on me. It is one of the numerous American plants which produce scarlet flowers, a colour, so far as I know, confined in the British flora to the Corn Poppy and common Pimpernel (*Anagallis arvensis*), both of them probably weeds of cultivation imported from sunnier climes. Our sunshine seems to be too intermittent and watery to light up the scarlet flame; we have plenty of good pink wild flowers, but in the stronger tones of red there is always an admixture of blue, bringing them perversely near magenta. We have nothing to match the lines of *Desfontainia*, *Lobelia cardinalis*, *Delphinium nudicaule*, *Salvia splendens*, *Castilleja minima*, *Bravaya genimiflora*, and a host of others that could be named. Neither is orange to be found in the corolla of any of our native flowers, except some splashes of that bright tint on the standards of Bird's-foot Trefoil (*Lotus corniculatus*). There is, indeed, an orange form of the Welsh Poppy (*Meconopsis cambrica*), but that is probably a garden sport. Luckily, the exotics which fly these gay colours can thrive in our climate lose nothing of their splendour under our cloudy firmament. *Herbert Maxwell, Monroith, Wigtonshire*

ORCHID NOTES AND CLEANINGS.

LAELIA JESSICA.

A PRETTY canary-yellow hybrid, *Laelia Jessica*, is sent by Eustace F. Clark, Esq., Evershot, Dorset, who is uncertain as to the exact parentage. The pollen proved true *Laelia*, and the probable

parentage is *L. coronet* × *L. jougheana*. *Laelia coronet* resulted from crossing *L. harpophylla* with *L. cumularina*; and in the flower sent by Eustace F. Clark, Esq., Evershot, Dorset, who is uncertain as to the exact parentage. The pollen proved true *Laelia*, and the probable

ODONTOGLOSSUM LADY ROXBURGH.

THIS little known *Odontoglossum* was raised in the gardens of Sir Jeremiah Colman, Bart., Gatton Park, Surrey (gr. Mr. Collier). It is now in flower, and although there is some variation with nearly equal segments. The crimped labellum is reflexed at the tip.

of *O. cirrhosum* in the sudden contraction of the broad petals, forming a short apiculate termination. Through *O. ardentissimum* and *O. Rolfeae*, *O. Pescatorei* enters twice into the composition of *Odm Lady Roxburgh*, and *O. Harryanum* and *O. crispum* once each. Both parents can be readily traced, and it would be interesting to note the results of further crossing.

FIG. 24.—*PRIMULA JAPONICA*. FLOWERS WHITE.
(See p. 68.)

parentage is *L. coronet* × *L. jougheana*. *Laelia coronet* resulted from crossing *L. harpophylla* with *L. cumularina*; and in the flower sent by Eustace F. Clark, Esq., Evershot, Dorset, who is uncertain as to the exact parentage. The pollen proved true *Laelia*, and the probable

HYBRIDISATION NOTES.

CHINESE SPECIES OF PRIMULA.

VERY little progress has been attained by crosses between these species, which do not seem to lend themselves readily to hybridisation. A great number of crosses were made, but the results are very limited. *P. pulverulenta* crossed with *P. Cockburniana* is the only one amongst the many that proved a success. This hybrid was exhibited at the Temple Show, May, 1907, under the name of *P. Unique*. It received an Award of Merit, and was figured in the *Gardeners' Chronicle* the following week. This was considered the most interesting hybrid exhibited. Since then the reverse cross produced a variety named *P. Unique Improved*; it has proved to be a better grower than the former. The flowers of both are a rich rosy-red, intermediate between the parents. The following crosses, made at the same time, produced seed. They were sown, and plants grown on. All bore flowers similar to those of the seed parent.

" <i>Kewensis</i>	×	" <i>obconica</i>
" "	×	" <i>japonica</i>

In the reverse crosses *P. japonica*, *obconica*, *pulverulenta*, and *Kewensis* only produced seed. These bore flowers similar to those of the seed parent. *P. sinensis*, when crossed with the other species, did not give seed. The improvement in this species is due to careful selection and hybridisation, and when the colours are well fixed they come true from seed. Great strides have been made, both in size and colour, especially in the giant strain.

April and May are good times to sow seed for autumn and winter flowering, and July and August for flowering in spring. Sow in 5-inch pots or pans, well drained, in soil consisting of two-thirds light loam, one-third leaf-mould or peat, with silver sand added. Only a very slight covering of soil or sand is required. Water the soil well and keep it moderately moist; cover with a piece of tiffany or other light material until the seed germinates, then gradually give air. As soon as sufficiently strong prick the seedlings off and pot them on as required. When established, place them in a cool house and grow them on. Winter

temperature 40° to 45° at night, 50° to 55° during the day.

P. obconica does not lend itself to hybridisation, but the strain has been greatly improved. The grandiflora strain has flowers as large as the ordinary *P. sinensis*, and is most useful for cutting purposes. Some have an idea that the size is due to crossing them with *P. sinensis*, but this is unlikely. The size and colour are produced by selection. At present there are eight or nine distinct colours, which are now fixed and come true from seed. The colours include lavender-blue, pink, rose, orange, reddish-crimson, bluish, mauve, and pure white. *P. obconica* is of easier cultivation than *P. sinensis*. It can be induced to bloom from spring to autumn, and the flowers last a very long time. *John Hall, F.M.H.*

GREVILLEA BANKSII.

The genus *Grevillea*, a member of the Proteaceae, includes upwards of 150 species, which, if we except half a dozen, are all natives of Australia. It is surprising that so few of the plants are in cultivation, as many of them are remarkably handsome, in respect either to the foliage or to the flowers. *G. Banksii* (see fig. 25) is a robust plant, forming a tall shrub or slender tree, from 15 feet to 20 feet high. The foliage is ornamental, and young plants are of a very decorative appearance, although scarcely equal in this respect to the better known *G. robusta*. It flowers, however, much more freely. The bright red blooms are produced in dense, terminal racemes, from 2 inches to 4 inches long. The silvery leaves are deeply pinnatifid, and measure from 4 inches to 9 inches. The plant succeeds in a sunny position in a cool greenhouse; but in summer it should be placed out-of-doors to ensure thorough ripening of the wood. The compost for potting should consist of equal parts of peat and loam, with sufficient sand to render it porous. As with all hard-wooded plants, care in watering is essential, as the roots must never be allowed to become dry.

VEGETABLES.

SELECTION OF POTATO TUBERS FOR PLANTING.

DURING the time of the Potato boom in 1903-4, when the variety Northern Star was sold for more than £200 a ton, my then employer purchased two pounds of the tubers. These were planted early in April, and produced 120 pounds of Potatoes, nearly all of which were large enough for planting. The following season we had a heavy crop of much larger tubers. I found Northern Star the most prolific variety I have grown, a good keeper, being in its best condition from Christmas to mid-February. Our method of selecting the seed tubers may be useful to others. When lifting we gathered the tubers into trays, being careful not to bruise them. They were then placed in a cool, airy shed facing north, and from thence removed into an underground root-house, which was well ventilated and cool, fresh air being admitted when the weather permitted. We considered that plenty of fresh air was essential to the health of the tubers, as it prevented the spread of disease; it prevented the seed from becoming heated, provided more natural conditions, and was an aid to disease resistance; it prevented the seed tubers from making growth until required for planting; and it gave the maximum strength to the tuber, enabling the young plant to grow freely. We found that seed Potatoes treated in this way, if any which showed signs of disease were removed before Christmas, often gave us better returns for several years than did seed tubers from fresh sources. *J. E.*

SELECT VEGETABLES.

MR. BECKETT'S remarks on p. 59 are of special value at the present time. Rather than plant early and mid-season Potatoes, I would recommend the planting of early and late varieties in alternate rows. Those who have not the convenience of a cold frame should plant Onion sets, which will escape injury by the maggot of the Onion fly. Growers of Cabbage, or any of the Brassica family, must remember to apply lime, or the crop will be likely to be affected by club-foot disease. It is especially necessary to apply lime to new land; in fact, almost any soil is benefited by a dressing of lime. *Scotch and Cottagers'*

Beckett did not mention the value of Peas, Broad Beans, Dwarf French, and Runner Beans. Scarlet Runners are grown on the roofs of houses, garages, stables, and in back gardens in London. The surplus pods may be salted down for winter use. It is to be hoped that better methods will be found to preserve vegetables for next winter than those in general use. I should like advice as to where reliable seed of Haricot and Butter Beans may be obtained, and the best varieties to grow of these legumes. *J.*

"ONCE-GROWN" POTATO SEED.

My own small experience with saving seed in tubers is limited to Golden Perfection, and was

Photograph by C. P. Roffill.

FIG. 25. GREVILLEA BANKSII: FLOWERS RED.

Kales are both good vegetables, but I prefer Asparagus Kale to either, on account of its greater productiveness and lasting qualities. Bandelions may be used in the same way as Chicory. Manure used for Mushroom beds has two values: (1) To grow the Mushrooms, and (2) the preparation of the manure fixes the nitrogen, which would otherwise be driven off by the heat of fermentation. Those residing near cavalry camps should make the best use of the horse-droppings. A good substitute for Spinach is Meverary, or Lincolnshire Spinach, Chenopodium Bonum-Henricum. The plant is perennial, and may be propagated by division of the roots, or from seed, but old seed does not readily germinate. This crop will succeed in almost any corner. Mr

not succeed. From the second lot that I had from the firm I saved seed three successive years; as the crop was very uneven, perhaps one plant in ten giving a yield, I made a very careful selection from those plants which gave a good number of even-sized tubers from the second crop. The result was little better than nothing. The third was made from tubers which were left in the ground till planting out, to see if this might make a difference, as thorough greening and exposure had possibly had a bad effect. The result from a dozen plants was that there was not a Potato for the table. The inference I make is that the stiffish soil and conditions in my Herefordshire garden are not suited for seed saving. *H. E. D.*

The Week's Work.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMY COLMAN, Bart., Gaitton Park, Reigate.

CYPRIPEDIUM.—The winter flowering section of this Orchid will now be passing out of bloom, and as soon as the flowers are cut any necessary repotting may be done. If it is not desired to increase the stock, the plants may be transferred into pots two sizes larger. The pots should be filled to about one-third of their depth with drainage material, covering the crocks with rough particles of the potting soil. The plants should be placed in the pots with the roots spread and the compost carefully worked in between them. Press rather firmly, and fill up to near the rim of the pot, taking care not to break the roots.

By giving these plants a fair amount of pot-room, better flowers, with longer stems, can be obtained than from specimens that are in a pot-bound condition. Plants that have been newly potted will be benefited by rather more heat than is required for established specimens. If the potting material is already moist, the plants will not require much water, but should be sprayed overhead two or three times daily until they develop new roots. Specimens already in large pots may be resurfaced with new compost, first picking out some of the old soil from between the roots and replacing it with new material. A suitable potting medium consists of three parts of good fibrous loam and one part peat or Osmunda-fibre broken up rather roughly. Remove all the small particles, and add some crushed crocks and silver sand to ensure a free passage of water. The compost should be allowed to become warm before using. The night temperature most suitable to these plants is from 55° to 60°, with a rise of 5° or 10° on sunny days. The above remarks apply to such *Cypripediums* as *C. insigne* and its varieties *Harefield*, *Sanderac*, *Laura Kimball*, and *Sanderianum*, and the hybrid *Leucanum*; also *C. Sallieri*, *C. Thompsonii*, *C. Eurvades*, *C. Mons. de Curte*, *C. G. F. Moore*, *C. Thalia*, *C. elatior*, *C. Hitchinsiae*, *C. Beckmannii*, *C. Waterloo*, etc.

ZYGOPETALUM.—When the plants of *Zygopetalum Mackayi*, *Z. Wigianianum*, *Z. crinitum* and others of that section pass out of cover they may be repotted. These Orchids resent frequent disturbance at the roots, therefore they should not be repotted until it is absolutely necessary. They produce large roots like those of *Cattleyas*, and require more rooting space than is generally necessary for other Orchids; the pots should be at least two sizes larger than those they formerly occupied. Let the pots be well drained with a double layer of crocks over the bottom; the method of potting should be similar to that for ordinary greenhouse plants. A suitable compost consists of equal parts good, fibrous loam and Osmunda-fibre chopped rather roughly, with a liberal addition of crushed crocks, crushed bones, charcoal and Sphagnum-moss. *Zygopetalum Ballii*, *Z. rostratum* and *Z. Recklingianum* are best grown in shallow pans and suspended from the roof rafters in a moist, shady position in the intermediate house. Employ as a rooting medium for these a mixture of Osmunda-fibre, A1 fibre, and Sphagnum-moss chopped rather short. *Z. Perrenoudii*, *Z. Clayi*, *Z. leucocillium* and *Z. Protherocanum* are best grown in pots in a similar compost. The more scendent-growing species, such as *Z. Sanderianum*, *Z. maxillare*, and its variety *Gartneri*, should be given attention as soon as the new growths begin to develop. These plants succeed best when fastened to portions of the stems of Ferns, to which the roots will adhere. Do not disturb the roots unnecessarily. The plants that have outgrown their spaces should be given a new piece of Fern stem fastened to the one on which the roots are already clinging; the young roots will soon adhere to the added portion. The plants should be grown in a moist, shady part of the intermediate house close to the roof-glass.

PLEIONE.—Plants of *Pleione maculata*, *P. Wallichiana*, *P. praecox* and *P. lagenaria* that are passing out of flower will soon be developing new roots from the base of the young growths, and at that stage they require repotting. The plants should be removed from their pots, and, after shaking away the greater portion of the old soil and separating the pseudo-bulbs, potted afresh, care being taken not to injure the roots. First, several plants together according to the size of the pan, allowing a space of about 1 inch between each pseudo-bulb. These Orchids are best grown on a shelf near the roof-glass or suspended from the roof rafters in an intermediate house. Afford water sparingly until the new roots have grown well in fresh compost, after which they will require copious supplies of moisture until the new pseudo-bulbs are fully matured. Syringe the plants overhead on bright days in order to ward off attacks of red spider. A suitable compost consists of good fibrous loam and peat or Osmunda-fibre in equal parts, mixed with a little powdered cow manure, crushed crocks and silver sand.

SHADING.—If the outside blinds were removed at the end of last summer they should be fixed again in position without delay, for in bright weather shading will be necessary for a short time during the middle of the day. This applies especially to houses containing such plants as *Odontoglossum crispum*, *O. Pescatorei*, and their many hybrids; *Masdevallia* and *Phalaenopsis*; *Dendrobium*, *Cattleya*, *Laelia* and their hybrid; will be safe without shading until a later period.

HOT WATER SYSTEM.—Exercise great caution in stoking the fires in the furnaces, taking care that the pipes are not unduly hot on bright mornings, as sunshine would cause the temperature to rise too high. Economy in fuel should at all times be considered, and it is more important than ever now.

FRUITS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., F.R.S., Gunnersbury House, Acton, W.

EARLY MELONS.—Those who sowed their first batches of Melons in January will do well to watch the progress that is being made. If not very satisfactory it will be well to sow again. In doing this, still keep to Ringleader or any other reliable and favourite variety. Ringleader will thrive well in a slightly lower temperature than many others. Those who have a good, healthy, early stock should now set about preparing a bed for them, if planting out is contemplated. Bottom heat will be desirable. This may be produced by good, sweet horse manure and warm pipes, and can be combined, if desired, with warm pipes. I advise those who have not tried pot culture to do so, still depending upon bottom heat. If ordinary flower-pots be lacking, make use of "sunk" pots. In every case press the loam firmly.

VINES IN POTS.—Those who rely on vines in pots for the earliest bunches, and who raise vines for the purpose, should start a suitable number of the plants which were pruned hard back in November or thereabouts. Early pruning will have induced the buds to plump up to some extent. Let these young vines have all the light possible, and do not grow them in a very warm temperature at the commencement of forcing. A minimum temperature of 55° will suffice, rising 10° to 15° in the daytime. Before the present month has expired the vines should be transferred to their fruiting pots, those 13 inches in diameter (6's) being suitable. I prefer pots of this size to those of 12 inches diameter (5's), which is the usual size adopted by trade growers, but to those who raise their own vines I recommend the larger size. The soil should consist of rich, yellow, fibrous loam of a calcareous nature, which is easily obtainable. Mix with it well-crushed mortar rubble and a small quantity of charcoal about the size of nuts. Do not add a concentrated fertiliser until growth is well advanced. If the pots are new ones let them be well soaked before they are used. The compost will be in a suitable condition for use when it does not cling to the hands if pressed. Pot

firmly, and allow room in the pot for a surface dressing later.

GRAPES IN STORE.—Give every attention to Grapes in the store, and see that no decaying berry remains even for one day. Some of the water in the bottles will have evaporated, and must be replaced. I find that a new oil-feeder can is the best thing to use as a filler. See that the temperature of the room is maintained as nearly at 45° as is possible. Late Grapes do not keep satisfactorily in an ordinary fruit-room with Apples and Pears.

EARLY VINERY.—The earliest vines have made good growth, and the laterals should be stopped at two joints beyond the bunch to be retained. Do not stop all the shoots at the same time, but pinch first those that are gaining strength most rapidly. All the shoots will be stopped, probably, in about three operations. Guard against an excess of atmospheric moisture in dull, cloudless weather, and when but little ventilation can be given, for too much moisture at such times favours the development of warty excrescences on the under sides of the leaves. This complaint will often occur on leaves that are not fully grown and will stop their growth. Continue to disbud the vines as growth proceeds, but leave at least two shoots where there appears to be any doubt as to which is the better of the two. A week's time will decide this question, and no harm will have been done meanwhile.

THE FLOWER GARDEN.

By W. J. CRUSE, Gardener to Mrs. DEMPSTER, Keele Hall, Staffordshire.

DAHLIA.—If the remainder of the old *Dahlia* tubers are placed in a light compost on stages in a warm house or pit, plenty of cuttings will soon be available for propagating. Spray the roots daily, but on no account should they be saturated with moisture, or the young growths will be soft and sappy, eventually turning yellow. Select short-jointed shoots for cuttings, and insert them singly in small pots filled with a light compost. Root the shoots in a brisk temperature, and afterwards remove them to a cooler house, shifting them into larger pots as required. The present is a suitable time to sow *Dahlia* seed thinly in pans or boxes filled with a rich compost, covering them lightly with fine, sifted soil. Directly the seedlings are large enough to handle, transfer them singly to small pots, and treat them as advised for cuttings. The stronger seedlings will not necessarily give the best flowers, and the less robust ones should not be discarded.

BEGONIA.—The tubers of *Begonia*s which have been stored through the winter should be placed in boxes in a compost of leaf-mould and sand. A similar position to that advised for *Canas* will suit them. Do not start them in a high temperature. The largest tubers may be divided to increase the stock, if necessary, and this should be done directly a little growth has developed.

CANNAS.—Old stools of *Canas* that were lifted last autumn and stored for the winter should receive attention. Shake the old soil from the roots, and place them in boxes or pots, using a light compost. A fruit-house that has just been started for forcing is suitable, as only a moderate amount of heat is necessary. To increase the stock divide the roots into single crowns, and pot them directly they have made a little growth.

CARNATIONS.—Carnations that have been wintered in cold frames may be planted in mild weather, but if the soil is wet or sticky defer the work until the ground is in a more favourable condition. Plants that were set out-of-doors last autumn should be examined after frost to see if they are loose, in which case they need pressing in the soil firmly with the foot.

FREMONTIA CALIFORNICA.—This deciduous flowering shrub is not difficult to grow, and is much hardier than is generally supposed. The

undersides of the thick, heart-shaped leaves are covered with dark brown hairs, and the young shoots have a rich brown, woolly appearance. The trusses of yellow flowers develop in April, and the plant continues in flower for a long period. The flowers are often 2 inches in diameter, and they will keep fresh for a long period after they are cut. The plant grows best in a rich, sandy loam, and established specimens make rapid growth. Plants may be raised either from seeds or cuttings; the latter should be inserted in the spring.

THE KITCHEN GARDEN.

By J. DEXS, Foreman, Royal Gardens, Windsor.

CUCUMBERS.—Plants of Cucumbers raised from seeds sown early in January will soon be ready for planting. Let the house in which they are to be grown be cleaned thoroughly, the walls whitewashed with hot lime, and, if Cucumbers have been grown in it recently, fumigated with sulphur to destroy red spider and thrips. When the fermenting material has been prepared, make up a hotbed to within 2 feet of the trellis and tread the materials firmly to prevent the bed from sinking. The soil may consist of equal parts of good turfy loam and leaf-mould, which should be placed on the bed a few days before the plants are inserted. Exercise great care in planting, so that the roots may not be broken. If the temperature of the bed is too high bore a few holes in each mound of soil to allow some of the heat to escape. When the roots appear through the surface top-dress them lightly with rich soil and a light sprinkling of bone-dust. Promote a moist atmosphere by the frequent use of the syringe. The night temperature should be 70°, rising to 85° by day with sun. Very little ventilation is necessary for some time, provided the fins are stopped during sunny weather. Plants in fruit should be thinned carefully of superfluous growth, and the shoots tied in position. Do not allow the foliage to become crowded, but remove all worthless shoots and rough leaves, which harbour insect pests. Top-dress the plants with light, rich soil as often as they grow through the surface. A sowing of Cucumber seeds should be made to raise plants for occasional cropping. Sow the seeds singly in small, clean pots and germinate them in a temperature of 70°. Every Day and All the Year Round are suitable varieties for present sowing.

ONIONS.—As soon as the frost is at an end and the soil is in a workable condition autumn-sown Onions should be transplanted. If the ground was trenched and manured in the autumn the recent frosts will have acted beneficially on it. When sufficient plants are available a large plantation should be made, as home-grown Onions will be very valuable. Plant in rows made 16 inches apart and allow from 6 inches to 9 inches between the plants in the row, according to the size of the bulbs required. Lift the plants from the seed bed with great care, and make the soil firm about the bulbs in planting. Water the roots copiously with clear, soft water. When growth commences stir the soil lightly with the Dutch hoe and give frequent dressings of soot during the growing season, choosing showery weather for its time of application.

CHICORY.—Fresh batches of Chicory roots should be placed in a temperature of 55° or 60° in order to maintain an unbroken supply. Perfect darkness is necessary to produce thoroughly blanching heads. The atmosphere should not be excessively damp, as the tender young shoots are harmed by too much moisture. A small supply of Chicory may be produced from roots forced in pots in a Mushroom-house or similar structure. One copious watering at the time of potting should suffice.

CELERY.—Make a small sowing of Celery with a view to producing plants for autumn supplies. Sow the seeds in pans filled with finely sifted soil, and cover them very lightly with soil. When the seedlings appear place the pans close to the roof-glass, and never allow the roots to suffer from want of water.

ROOTS IN STORE.—Beet and other roots in store should be examined and all young growth removed. Keep the roots as cool as possible, without allowing them to become frost-d. Onions should be examined and all decaying bulbs removed; bulbs showing signs of growth should be selected for present consumption. Potatoes in store should be picked over during inclement weather, and seed tubers selected and placed in single layers in a frost-proof shed where light and air can be admitted during favourable weather. Much depends on the proper selection and care of seed Potatoes, and no time should be lost in securing the necessary quantity.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

WINTER-FLOWERING BEGONIAS.—The beautiful Begonias are deservedly popular, and should be grown in all gardens to produce brightly-coloured flowering plants in mid-winter. Plants in flower now can be maintained in good health by keeping all the old blooms picked off and giving the plants a little liquid manure-water weekly. The plants should not be over-watered, but must not be allowed to become extremely dry. A fairly dry atmosphere is best for plants in bloom, ventilating a little each day, if possible, with a temperature of 55° to 60°.

BEGONIA GLOIRE DE LORRAINE. This is the oldest of winter-flowering Begonias, and still one of the most satisfactory for general decorative purposes. If propagated early in the season, and grown without a check, plants will come into bloom early in the autumn, and by propagating a later batch a continuous supply of flowering plants can be maintained for at least six months. Plants that are now past their prime should be removed from the flowering house or conservatory, and the healthiest plants reserved for the production of cuttings. All the flowering growths should be cut off, but the plants must not be pruned too severely, or they will fail to start again into growth. Place the plants in a warm, light house, near the glass, so that the cuttings may be sturdy and vigorous when the time for propagating arrives. Very few root waterings will be necessary at this stage, but maintain plenty of atmospheric moisture by spraying the plants every day in bright weather. Other varieties of this type, such as the white-flowering *Tunford Hill*, will require similar treatment.

BEGONIA GLOIRE DE SCEAUX. This variety forms a contrast to the one named above, and is well worthy of cultivation. The beautiful bronzed foliage, of perfect shape, shows up the panicles of rose-pink flowers to perfection. Grown in ordinary conditions, this Begonia is at its best in the spring, and plants coming into bloom now should be assisted with a little artificial manure or other stimulant, such as soot or liquid manure. By propagating early, and getting strong plants of firm growth ready to place in a little extra heat in autumn, a batch of plants may be forced into bloom by Christmas. Well-grown and shapely plants are first-class subjects for decoration in warm, light rooms, but these Begonias must never be placed in cold and draughty corridors.

BEGONIA NITIDA AND B. NITIDA ALBA. These Begonias, with the varieties named above, make a selection that will bloom nearly the whole year. They succeed in similar conditions, well-cultivated plants in pots reaching a height of 4 or 5 feet when trained to pillars in the stove or warm plant house.

TUBEROUS BEGONIAS. The newer hybrids obtained by crossing *B. socotrana* with the summer-flowering tuberous Begonias should be kept somewhat drier after the flowering period is over. Stand them in a warm, light place, reducing the water supply gradually, but avoid drying them off suddenly. Some of the best varieties are *Optima*, *Mrs. Heal*, *Ensign*, *Elatior*, *Winter Cheer* and *Emita*.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVEY, Abbots Wood, Godalming, Surrey.

MULCHING FRUIT TREES.—The mulching of fruit trees has great value, and especially to trees growing in light or shallow soils. Mulching may be done at two seasons; at the present time, for strengthening the flowers and early growth, and when the fruits are swelling and approaching maturity. Well-decomposed cow or farmyard manure forms the best material for mulching trees. The dung should be used liberally—say to the depth of 1 inch and a half over all the surface of the rooting area, and it should be well beaten to pieces with a fork before it is spread. Do not apply a mulch of this nature to newly planted trees, but place a sprinkling of straw litter over the roots. All bush fruits, and especially Gooseberries, Raspberries and Currants, are much benefited by annual dressings of animal manure.

STANDARD TREES OF APPLE AND PEAR.—The present is a suitable time to overhaul the orchard, pruning where necessary, to relieve the trees of superfluous wood, dead and decaying branches, and weak growths. Trees that are sprayed with caustic alkali wash will not show much foreign growth upon them, but scrape any lichen growth there may be present on the stems. The frost has probably destroyed many insect pests, we recorded 20° of frost on several mornings. But do not trust to the frost to clear the trees of pests, which hide in crevices and other sheltered places.

ARRAIRS OF WORK.—Work of all kinds has been retarded by the wintry weather, and especially the pruning, tying, staking, and planting of the trees. The days are lengthening fast, and every month in spring brings important work to be done. Make up for the loss of time by increased efforts, remembering that it is our serious duty to grow as much food—of which fruit is an important item—as possible.

GENERAL REMARKS.—Prepare stakes for use when required, also shreds for nailing, and place them in bundles. Overhaul all netting and make repairs where necessary. Materials used for shooling should be put in order, to save time later in the busy season.

ROSY APPLE APHIS.—The Rosy Apple aphid, the life history of which has been described recently by Messrs. BAKER and TURNER,* attacks the foliage of Apples, and deforms the growing tree as well as the fruits. The authors conclude that the proper name for this aphid is *A. malifoliae*, of which name *A. sorbi* is to be regarded as a synonym. The species occurs both in Europe and in North America. Eggs are found on the Apple in winter lodged generally on small twigs under buds or in crevices of the bark. The eggs begin to hatch early in April, and the stem-mother wanders about the twigs till it reaches a bud, where it settles and feeds, crowding into the bursting bud. After their last moult the stem-mothers begin to reproduce, and an individual may produce 260 young in the course of twenty days. The length of life of a stem-mother is at the most forty-five days. Several generations, in which both wingless and winged forms appear, occur on the Apple, the proportion of winged insects increasing with the successive generations. Migration to the Plantain begins towards the middle of May, and most of the insects have left the Apple by June 20. So many as fourteen generations of the summer form of the aphid occur—practically all wingless. The autumn migrants become adult in September, and remain in the trees until after the beginning of November. Oviparous females begin to be produced in mid-September, but their numbers are greater later on—in October—at which period males are numerous. Oviposition begins in the middle of October and continues until all the oviparous females are dead.

* "Rosy Apple Aphid," *Journal of Agric. Research*, VII., 7 Dept. of Agric., Washington.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W. C.

Editors and Publisher.—Our correspondents would obtain delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and such unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, FEBRUARY 27.—
Roy. Hort. Soc.'s Coms. meet.
Hort. Club's annual meeting, dinner and lecture.

AVERAGE MEAN TEMPERATURE for the ensuing week obtained from observations during the last fifty years at Greenwich, 39.6°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, February 15 (10.0 a.m.): Bar, 29.6", temp. 38.5". Weather—Bright.

SALES FOR THE ENSUING WEEK.

MONDAY.—
Rhododendrons, Hardy Heaths, &c., at the American Nurseries, Mifflin, Surrey, by Protheroe and Morris, at 12 o'clock.

TUESDAY and WEDNESDAY.—
General Nursery Stock, Fruit Trees, &c., at the Box-Johnie Nursery, Boxbourne, by Protheroe and Morris, at 12 o'clock each day.

WEDNESDAY.—
Hortacoon Plants, Roses, Fruit Trees, Bulbs, &c., at Protheroe and Morris's Rooms, 67 and 68, Cheap-side, at 12 o'clock. Lilies in cases at 3 p.m.

THURSDAY.—
Standard, Dwarf, and Climbing Roses, at Protheroe and Morris's Rooms, at 1 p.m.

FRIDAY.—
Herbaceous Plants, Roses, Fruit Trees, and Bulbs, at Protheroe and Morris's Rooms, at 12 noon.

A Cyclopædia of Horticulture.*

The fifth volume of this comprehensive work is carried out on similar lines to those explained in these pages on June 17 last. Primarily the book is written for the benefit of American readers with a vast continental country and a great variety of climates, in which they cultivate very varied plants that succeed in one or other of the respective areas embraced. In the matter of cultivation only broad and general instructions can be given, so that there is room for a number of smaller books to be written by local cultivators who are conversant with the peculiarities of their particular part of the country. Special lists of trees, shrubs, and climbers, suitable for different latitudes and climates, however, will help the uninitiated to plant their estates suitably. Hints are given under the descriptions of species whether they are likely to succeed in the north, south, east or west, or in any particular part of the area embraced by the work as a whole. Readers in this country will find much to interest them, for constant reference is made to European works, including British, whether the plants cultivated are native or introduced. The origin of the

Shirley Poppy, as described by the Rev. W. Wilks, many years ago, is recorded, and the characters and range of variation or limitation of admissible colour are as accurately defined as a florist's flower. It is a remarkable type of concentric variegation, and the albium may be regarded as centripetal, for it commenced at the margin of the petals and proceeded to the centre of the flower.

The intention throughout is to confine the *Cyclopædia* to the plants that are actually in cultivation, though a few doubtful ones are included, and some that have not even been introduced. Apparently there is a field for the cultivation of Primulas in America, for Mr. Bailey himself has described no fewer than 200 species. Though these are in cultivation at present, it is unlikely that a title of them are likely to attain the popularity of *P. sinensis*, *P. obconica*, *P. Auricula*, the Primrose and the Polyanthus.

Incidentally, it is interesting to note that *Platanus occidentalis* is, perhaps, the tallest deciduous tree in America, attaining a height in exceptional cases of 170 feet. It is not so reliable a tree to plant as *P. orientalis*, because liable to be much injured by the disease *Gloeosporium nervisequum*, whereas the oriental species is not. The suitability of the London Plane for street planting is commented upon, because of its amenability to pruning and transplanting.

The important genus, *Prunus*, is divided into four groups or sections, namely, (1) Plums and Apricots, (2) Almonds and Peaches, (3) Cerisees, and (4) Padus or racemose Cherries. Though Plums and Apricots have much in common, the downy skin of the fruit of the latter, not to mention other characters, might have been sufficient to warrant a separate class for them. The mature fruit, whether raw, boiled, or canned, is as distinct from a Plum as from a Peach. The purple-leaved Plum is recognisable under the name of *P. cerasifera* var. *Pissartii*, the latter being the best-known garden name; and *P. divaricata* has been reduced to *P. cerasifera* var. *divaricata*, Bailey. The systematic position of many of the common Plums has often been the subject of contention, and this is largely due to matters of opinion rather than of fact. *P. insititia*, Linn. (Bullace), is here recorded under the name of *P. domestica*, Linn., var. *insititia*, Bailey, and is made to include the Damson, Bullace, probably also St. Julien, and other Plums. Some of the reasons adduced for this opinion are that the Bullace is a form with small leaves, small, firm, oval, or ovoid fruits borne mostly in clusters, and "when the Plum runs wild it usually reverts to this form." Now, the Bullace has globular fruits, with an ovoid stone, and a downy peduncle, produced singly or in pairs, and this latter character applies to all Plums. Only the buds from which the fruits arise are crowded, for the flowers are never in umbellate clusters. Damsons were cultivated at Damascus before the Christian era and introduced from thence to this country.

It is quite reasonable to assume that seedling Plums, escaped from gardens and orchards, revert to degenerate types, resembling the Damson. In like manner *P. Cerasus* (Wild Dwarf Cherry) is made to include *P. acida*, the origin of which is unknown. Would it not be better to retain the old type under the name *P. Cerasus*, Linn., than to say *P. Cerasus* var. *typica*, Schneid.? It would certainly be more conducive to simplicity. *P. acida* is rendered by *P. Cerasus* var. *frutescens*, Schneider. The latter is distinguished by its dwarfer habit, smaller leaves and a longer stone. Each of these types of Cherry has varieties that can be ranged under them.

The numerous and important species of *Pyrus* have also been grouped in sections, which are commendable, because they retain the identity of Pears and Apples. The Ornamental Crab, well known as *Pyrus floribunda*, has its name changed to *P. pulcherrima*, Achers and Graebn., who evidently consider the better-known one a *nomen confusum*, because Lindley had used *P. floribunda* for a member of the section *Aronia*. The hybrid *P. Scheideckeri* has been reduced to a variety of *P. pulcherrima*, from which it was a seedling, possibly as the result of a cross, or pointing to the hybrid origin of *P. pulcherrima* itself.

The use of such names as *Pelargonium domesticum*, to include the hybrid race of show and fancy varieties, and *Penstemon gloxinioideus* for the florist's varieties, is peculiar. *Pelargonium vitifolium* is said to differ from *P. cordatum* by its erect habit and less deeply cut leaves. This is an obvious mistake, for the leaves of *P. cordatum* are usually merely dentifolate. There is but a remote comparison between the two, and the writer probably meant to compare *P. vitifolium* with *P. capitatum*, for that is where the comparison lies. Apart from this, errors of fact are evidently few, and the editing has been carefully carried out.

HONOURS FOR AGRICULTURE.—We are glad to observe that the Colonial Office list of honours contains the names of two gentlemen who have rendered conspicuous service to agricultural or botanical science. Dr. FRANCIS WATTS, Imperial Commissioner of Agriculture for the West Indies, becomes K.C.M.G., and a like honour is conferred on LEONARD ROWAY, Esq., Government Botanist to the State of Tasmania.

HORTICULTURAL CLUB ANNUAL MEETING.—The annual general meeting of the members of the Horticultural Club will take place in the Club Room, Hotel Windsor, Westminster, on Tuesday, the 27th inst., at 6 p.m. There will be a dinner at 6.30, and afterwards Mr. JAMES HYDSON, V.M.H., will speak upon "Select Varieties of Water Lilies," illustrating his remarks with a series of slides showing these gorgeous flowers in their natural colours. The president, Sir FRANK CRISP, Bt., will preside. Members intending to be present are asked to communicate with the hon. secretary, Mr. HOOVER PEARSON.

IMPORTS OF DUTCH FLOWERS.—A deputation from the British Wholesale Florists' Federation, consisting of Mr. GEORGE MONRO, jun. (chairman), W. H. PAGE, GEORGE SHAWYER, W. A. SHERWOOD and C. H. CURTIS (secretary), together with Mr.

* The Standard Cyclopædia of Horticulture. By L. H. Bailey. Vol. V., P. R. Pages 2425-3041. Figures 2094-3315. (The Macmillan Company, New York; Macmillan & Co., Ltd., London.) 25s. net.

G. H. BARR, who represented the Horticultural Trades' Association, attended at the Offices of the Imports Restrictions Committee, Board of Trade, a few days ago, and was received by H. J. PHILLIPS, Esq., secretary of the committee. The matter under consideration was the importation of flowers grown in Holland from bulbs which were excluded under the Order prohibiting the importation of Dutch bulbs. The tonnage now occupied and which would possibly be occupied in the near future; the fact that the imports of Dutch flowers would mean the sending of considerable sums of money out of this country;

THE WEATHER AT LA MORTOLA. Mr. BENBOW, superintendent of Lady HASBURY'S gardens at La Mortola, informs us that the weather in the closing months of 1916 was very wet, and that the heavy rains were accompanied by boisterous gales. These culminated on December 15, about midday, in a storm of cyclonic violence, which lasted about an hour. The area visited by the gale was very restricted, but it did much damage, stripping away branches and uprooting many specimen trees. Outside the gardens Olive trees were torn from their roots and many houses of the village had their roofs

would take place on the 24th inst., whereas the dates that should have been printed are April 24, 25 and 26.

THE WILD CHINESE PRIMULA.—In the conservatory (No. 4 greenhouse) at Kew is a group of some fifty plants of the Chinese Primrose, *Primula sinensis*, the majority being in 5-inch pots. The plants are very decorative, with their light green foliage and dainty, pale lilac flowers.

CULTIVATION OF VACANT LAND.—In answer to a question in the House of Commons, Sir R. WINFREY stated that the number of plots

FIG. 26. *TALHO VITTEVA* (ORCHID). See Vol. 1, p. 37, the Orchid Committee, p. 37.

that such imports would very seriously affect home flower producers who had purchased British grown bulbs at enhanced prices; and the injurious effect all this would have upon the future of the British bulb-growing industry, were points put forward by the Deputation for the consideration of the Imports Restrictions Committee.

WEATHER AT KEW. It is interesting to compare the Kew records of the hard frosts of February, 1895, twenty two years ago, with the same dates on five consecutive days of the present month, the degrees of frost registered being as follows: 1895, February 5, 12½; 6, 24½; 7, 27½; 8, 28½; 9, 27. 1917, February 5, 16; 6, 10; 7, 25; 8, 20; 9, 17.

blew off. The amount of rainfall at La Mortola, the total being 1537.9 mm., of 55.7 inches. The previous record year was 1907, when the rainfall was 1192.2 mm., or 47.9 inches.

POTASH FROM SEAWEED. According to the *Salt World* U.S.A. plans are completed for harvesting the seaweed in the Sargasso Sea to obtain potash. The plant is said to have a capacity of 200 tons of ash per day and a storage capacity for two weeks' supply. The seaweed is said to contain 9 per cent of potash.

THE WALTON GRANGE ORCHIDS. By a mischance it was stated in these pages last week that the sale of the Walton Grange Orchids

known to the Board that have been already taken up under the Cultivation of Lands Order (1916) is 6,682.

EDUCATIONAL GARDENS IN YORKSHIRE.—At Stamford, near Halifax, a complete scheme of educational gardens has been in existence for several years, and has been found very successful. The elementary education authorities provide the first plots, on which the children in the schools begin their training; land, tuition, tools, manure, seeds, and all other materials are provided free of charge, the children only supply the labour, and working during school hours. The profits of the gardens are, however, sold to defray a part of the expenses. There are also

plots for evening school students, the conditions being the same as for the day scholars, except that here the produce becomes the property of the student. Beyond this, there is a set of plots for adults, on which everything is paid for by the holder of the allotment, all the profit being his own. The whole scheme has been found a success, and has had a considerable moral influence, especially on adolescent youths, to whom the plot is the only alternative to the street corner.

WAR ITEMS.—Second Lieutenant DORRIS CURTIS, Middlesex Regiment, son of Mr. and Mrs. W. H. CURTIS, of the Nurseries, Barnet, has been awarded the Military Cross for brave and distinguished conduct in the field. In January, 1916, he received a bullet wound in the thigh, and was in hospital.

—Lieut. E. L. BENOUE, son of Mr. BENOUE, of La Mortola, has been awarded the Military Cross for brave conduct. He volunteered at the beginning of the war, joining the Royal Field Artillery, and was granted a commission in October, 1914. He is a pilot in the Royal Flying Corps, where he earned his distinction.

THE "ORCHID REVIEW."—The twenty-fourth volume of the *Orchid Review* is dedicated to O. O. WINGLEY, Esq., Bridge Hall, Bury, "an enthusiastic and highly successful amateur of Orchids for a period of over half a century," which reminds us that the *Review* has flourished for a period nearly equalling that for which the Reichensbachian Herbarium was sealed up. The interest is well maintained, this and the two later numbers containing articles on Albinism and Colour in Orchids, by R. G. THWAITES, Esq., and M. CH. MARON; a Parasitic Orchid Fungus which has been identified from Ghazevain; the Glympton collection of Orchids, in which the experiences of an amateur are detailed; a review of Dr. Lorz's recent work, "Evolution by Hybridization"; Orchids fifty years ago, based on records in our own pages of that period; and numerous other interesting notes and figures. We congratulate the Editor on his continued success.

THE LOCAL SOCIETIES.—The Executive Council of the British Gardeners' Association is asking the Government to release skilled gardeners at present serving in the Army and Non-Combatant Corps, and who are not in classes A or B, in order that they may assist in the work of speeding up the cultivation of food crops.

—Lidget Green Horticultural Society is sending a petition to the Board of Agriculture on the question of the refusal of the local Parks Committee to entertain a suggestion made by the society, and in ignoring the claim to use the Corporation land adjoining the present allotments at Lidget Green, and instead using land for allotments which, in the opinion of the society, is unsuitable for the purpose.

—The third lecture of a series of twelve on vegetable production was delivered by Mr. E. R. JAMES at the Hall of University College, Reading, on the 7th inst. The lecturer dealt with methods of sowing Peas and Beans under glass or in cold frames in order to compensate for the loss of time occasioned by the severe weather. The cultivation of Parsnips and Jerusalem Artichokes was also described, and methods suitable for different types of soil were given.

—A public meeting, under the auspices of the Town Council of Dalbeattie and the Uir and Dalbeattie Horticultural Society, was held in the Town Hall, Dalbeattie, on the 6th inst. Addresses were delivered by PROVISOR AINSFORD, Maxwelltown, and Mr. WILLIAM HUTCHINSON, Termegles Gardens, the latter dealing with the cultivation of vegetables. At a meeting held afterwards it was agreed to form a food production society for the district.

PUBLICATIONS RECEIVED.—*The Fruit, Flower, and Vegetable Trades Year Book and Diary*, (London: The Lockwood Press, Mitre Court, Fleet Street.) Price 1s. net.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

CALECOLARIA BURBIDGEI.—In reference to the note by H. T., on p. 58, respecting the parentage of this useful decorative plant, I am able to say that Mr. Burbidge's statement is correct. In 1915 I crossed *C. tubasi-aeolia* with pollen of *C. Pavonii*, raising a number of seedlings identical with *C. Burbidgei*. (The reciprocal cross gave me no good seed.) Like the original, my plants were all sterile when crossed inter se, or with their parents; neither have I been able to effect a cross with it and any other species or variety, of which I have tried many. Nicholson's *Dictionary of Gardening* gives the correct parentage, but if it is intended to be understood that the first name is that of the female parent, the original *C. Burbidgei* was made in the reverse way. As H. T. points out, the *Key Hand-List* gives the parentage of *C. amplexicaulis* and *C. Pavonii*, and it was these conflicting statements which led me to try to settle the matter definitely. E. J. Allard, *Merton*.

POTTING PALMS.—Mr. Weston, on p. 60, gives sound advice on the potting of Palms. As he states, Palms may be kept in a healthy condition in the same pot for years, provided they are watered properly and given an occasional stimulant. There comes a time, however, when it is necessary to repot them, for most of the stronger growing Palms, such as Kentias, the different kinds of Phoenix, *Corypha*, and *Chamaerops*, send many of their stout roots right to the bottom of the ball of earth, where they coil round, and in time lift the entire mass. The difficulty, then, with pots of ordinary make, is to get one deep enough to take the ball without being too wide for the welfare of the plant, which so treated looks what is commonly termed over-hatted. To avoid this difficulty I induced the potters to make the pots intended for Palms of this class deeper in proportion to their width than those for ordinary purposes. This proved in every way satisfactory, and greatly simplified the work of potting. Another point to be considered when the Palms are employed for decorative purposes is that these narrower pots, containing as they do less soil, are lighter to lift about than those of ordinary shape. They, too, contain as much of the potting compost where it is needed as do the wider ones. This difficulty with regard to pots is not so marked in the case of the more delicate rooted sorts. W. T.

CHANGE OF SEED POTATO.—Appreciation of the remark of E. M. regarding the cottager who has continued sowing his own seed of Potato Ring-leader for twenty years with good results. I grew Pink Beauty of Hebron for a number of years from my own saved seed, originally procured from a cottager in the same neighbourhood, who had saved it from his own crop for several years. The results were good, but I ceased growing that variety some time ago in favour of a slightly earlier sort. The practice of growing has been making headway, even among cottagers, although the seed I obtained from the cottager had not been grown, but kept in baskets under his bed! S. L. Duntriss.

MOLES AND FROST.—On the 3rd inst. I was in Epping Forest sprinkling food for the benefit of the wild birds, and in the course of my wanderings came across a little grassy spot amongst bushes on the outskirts of the wood, and there I was astonished to see two or three fresh molehills amongst several others of older date, the latter, of course, being white with frost or snow, and the brown soil of the fresh ones contrasting strongly therewith. Marvelling at first that moles should be able to throw up their hillocks—one of these, by the way, was very large, and undoubtedly the nest, or so-called "fortress"—through six or more inches of frozen soil, I afterwards came to the conclusion that probably the grass, although not dead and dry, afforded some protection from the frost, and so the depth of frozen soil was not so great. I am glad to see in your current issue (p. 65) so opportune a confirmation of my conclusion. C. N. Hole End.

SOCIETIES.

ROYAL HORTICULTURAL.

FEBRUARY 15.—The one hundred and thirteenth annual meeting of the Society was held at 3 p.m. on Tuesday last, in the Council Chamber in the Vincent Square Hall. The exhibition took place in the Drill Hall of the London Scottish, Buckingham Gate, and was much smaller than usual for an annual meeting.

The Floral Committee recommended two Awards of Merit to novelties, and four medals to groups.

The Orchid Committee recommended one Award of Merit and one Preliminary Commendation to novelties, and two medals to groups.

The only award made by the Fruit and Vegetable Committee was a Silver Knight Medal to a collection of Apples.

The Narcissus Committee met for the first time this season.

Floral Committee.

President. Messrs. E. A. Bowles (vice-chairman), W. P. Thomson, E. H. Jenkins, G. Paul, W. J. Bean, John Green, W. B. Cranfield, G. R. Uthe, G. Harrow, J. W. Moorman, J. Heal, E. F. Hazelton, C. R. Fielder, J. Jennings, W. Howe, H. Cowley, J. Dickson, A. Turner, C. Dixon, W. H. Page, Chas. E. Pearson, R. C. Nottcutt, and G. W. Barr.

AWARDS OF MERIT.

Freesia La France.—A variety with large, open flowers, of soft lavender colour, borne on long, branching stalks. The interior of the throat is faint yellow, with a few lines of lavender colour. The individual blooms measure 1½ inch across, and were not unlike those of a small *Streptocarpus*. The variety is a notable advance in this useful bulbous plant. Shown by Messrs. H. CHAPMAN, LTD.

Primula intermedia alba plena.—A pale variety, with a double row of petals, produced by splitting of the original petal-ridges. The petals are not dead white, but show a faint trace of colour, and there is a little yellow in the eye. The foliage is pale green, and of the "Fern" type. The plant is very floriferous, and makes a highly decorative subject. Two other varieties of the same breed were shown, named *Albina* and *Mauve Queen* respectively. Exhibited by Messrs. W. and J. Brown, Stamford.

GROUPS.

Mr. J. MacDONALD, Harpenden, exhibited dried and herbarium specimens of grasses, the latter being some of the finest examples of pressed and mounted plants we have seen. There were in all about 100 species and varieties, many of them being rare grasses. Some of the more interesting were *Milium verticillatum*, the smallest grass, with spikes tinted violet; *Aira caryophylloides*, taller than *A. praecox*, and with more elegant, laxer spikes; *Festuca amethystina*, a fine leaved species; the rare *Lolium tenuistylum*; *Poa bulbosa* var. *viparina*; *P. alpina*, which is also viviparous, these mountainous species relying on this means of reproduction owing to the disadvantage in high altitudes for seed production; and *P. nemoralis*, that grows well in the shade. (Silver-gilt Flora Medal.)

Mr. J. SIMMONS, The Nurseries, Hounslow, was awarded a Silver Flora Medal for a group of Hyacinths, Tulips and Daffodils.

Messrs. H. CHAPMAN, LTD., Ryve, were awarded a Silver Banksian Medal for hybrid *Freesias* and seedlings of King Alfred Narsissus.

A collection of Perpetual-flowering Carnations, exhibited by Messrs. ALLWOOD BROS., Wivelsfield, Haywards Heath, was awarded a Bronze Banksian Medal.

Other exhibits were winter-flowering Sweet Peas of Messrs. Morse's strain, shown by Messrs. DOBBIE AND CO., Edinburgh, and Perpetual-flowering Carnations, exhibited by Messrs. STUART LOW AND CO., Enfield. The Sweet Peas represent the best of the winter-flowering type grown in America, and included the varieties Early Heatherbell, soft rose, with deeper coloured edge; Early Morning Star, a large flower, with carmine-coloured standard, paler wings; Early Snowflake, white, the biggest

blooms: Early Spring Maid, cream, ground pink; and Early Melody, bluish pink, similar in colour to Elfreda Pearson. The flowers were much frilled and the foliage distinct from that of ordinary Sweet Peas.

Orchid Committee.

Present. Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. J. A. O'Brien (hon. secretary), Walter Cobb, William Bolton, R. A. Rolfe, Frederick J. Hanbury, R. G. Thwaites, Burtin Rallo, E. R. Ashton, E. H. Davidson, Arthur Dyer, H. Curtis, J. Charlesworth, R. Brown and White, and T. Armstrong.

AWARDS.

AWARD OF MERIT.

Laelio-Cattleya Trident (L. Dana × C. Trianae *Burckhausiana* (see fig. 26) from Messrs. FLOXY AND BLACK, Orchid Nursery, Slough. A remarkable and showy hybrid, disclosing in a very interesting manner the effect of heredity. The flowers are equal in size to those of C. Trianae, and the petals develop in a very effective manner; the narrow purple feather on the petals of C.T. *Burckhausiana* so that the colouring takes up three-fourths of the area of the petals (the shaded portion of the figure), leaving the upper third and margin white. The lip, which is deep ruby-crimson with chrome-yellow base, shows the influence of *Laelia Dyanum*, which, with L. purpurata, produced L. Diana, in the tubular form of its base and in the raised lines running into the disc.

PRELIMINARY COMMENDATION.

Odontoglossum Altrichii (var. *eximium* × *lucidum* awarded), from Messrs. ARMSTRONG AND BROWN, Orchidist, Tunbridge Wells. A large flower of perfect form, white, with the inner halves of the segments closely blotched with light claret colour.

CULTURAL COMMENDATION.

To Messrs. ARMSTRONG AND BROWN for a specimen of *Epidendrum polyblabum*, and another still larger of the variety album which has pale yellow sepals and petals and pure white lip. Each plant bore over 100 flowers. The plants were imported from Jamaica about fifteen years ago.

GENERAL EXHIBITS.

MESSRS. ARMSTRONG AND BROWN, Orchidist, Tunbridge Wells, were awarded a Silver Flora Medal for a group containing a fine selection of their new hybrid *Odontoglossum*, together with some of their stock plants used for hybridising, one of which is *Odontoglossum orchidiflorum* variety *humboldtii* a fine spike of reddish-lavender coloured flowers with a gold tint, the tip of the lip only being white. The best of the hybrids were *Odontoglossum Fabia* (Aglao × eximium), a charming dark flower showing the O. *Vuytsteke*, obtained through O. Aglao, in the lip; and O. *Aurea* (Mars × odontoglossum), the flowers of which are dark chocolate-purple with white margins and bases to the segments.

MESSRS. CHARLESWORTH AND CO., Hayward Heath, were awarded a Silver Flora Medal for a group which included splendid examples of varieties of *Odontoglossum*, of which one blotched form was equal to the best shown. There was also a selection of brightly-coloured *Odontodias*, two good forms of *Brasso Laelio Cattleya Joan*, one of them of a deep yellow colour, fine forms of *Laelio-Cattleya Serbia*, L.C. *Daphne* (L.C. *Gottioiana* × C. *Trianae*), a snowy, bluish-white flower with crimson lip; L.C. *Bella alba* and the new and pretty L.C. *Miranda* (*Dominiana* × St. Gothard), a rose coloured flower with purple lip changing to lilac towards the margin, and having fine gold lines from the base.

MESSRS. FLOXY AND BLACK, Slough, showed a selection of hybrids, including their new *Sophron Laelio-Cattleya Myra* (L.C. *Myra* × S.L. C. *Althea*), the copper-tinted light-rose coloured flowers having a neatly formed ruby-crimson lip with yellow base.

DR. MICHEL LACROZE, Southampton, showed *Laelio-Cattleya Santa-Fe* (L.C. *Copia* × C. *Enid*), a large bluish-white flower with fine purple lip, crimped at the edge and having gold lines at the base.

C. B. HAYWOOD, Esq., Woodhatch Lodge, Reigate (gr. Mr. J. Harris), showed a hybrid *Cypripedium Mary* of unseeded parentage,

showing the influence of C. *Harrisianum superbum* in the dorsal sepal.

J. ANSALDO, Esq., Rosebank, Mumbles, South Wales, exhibited a *Cypripedium* of the C. Baron Schroder class, which had developed three perfect flowers from a noded base produced from the centre of the growth, and each borne on a separate stem, as is the case when only one flower is produced.

MESSRS. SANDER AND SONS, St. Albans, showed a good form of their handsome *Laelio-Cattleya* Sir Douglas Haug, for which they had previously secured an Award of Merit.

Narcissus Committee.

President. Messrs. E. A. Bowles (chairman), W. Pompart, J. Jacob, P. B. Barr, F. H. Chapman, W. W. Cranfield, G. Reuther, and C. H. Curtis.

MESSRS. H. CHAPMAN, LTD., Ryde, showed plants of *Tripp Kaufmanniana* under the varietal name *gwynsis*. They were flowering with freedom, and said to reproduce freely. The Committee regarded them as representing the true type, and recommended a Botanical Certificate.

Fruit and Vegetable Committee.

President. Messrs. J. Cheal (vice-chairman) W. Wilks, H. Markham, A. Bullock, J. G. Weston, W. Humphreys, W. H. Divers, J. C. Algotov, P. C. M. Vetch, E. A. Buxard, F. Perkins, F. Beckett, W. Bates, H. Somers Rivers, W. Pompart and John Harrison.

MESSRS. J. CHEAL AND SONS, Crawley, were awarded a Silver Knightlet Medal for a collection of Apples, of which the more notable varieties were Bramley's Seedling, Emperor, Auro-Elizabeth, Humbly's Seedling, Ayrshire, Blenheim Pippin, and Cradley Bunt.

ANNUAL MEETING.

The one-hundred and thirtieth annual general meeting of the Royal Horticultural Society was held at 5 p.m. in the Central Council Chamber of the Victoria Square Hall, Sir Harry J. Veitch occupied the chair, and there were about eighty Fellows present. The secretaries apologized for the inconvenience caused by the necessity of meeting in so small a room, which the members could understand was due to the occupation of the hall by the military authorities. He then proceeded to read the minutes of the last annual meeting, and moved the election of nineteen new Fellows. These were unanimously elected, and the minutes adopted.

Before presenting the annual report of the Council Sir Harry Veitch stated that the president, Field-Marshal Lord Grenfell, much regretted his inability to be present, owing to his indisposition. In regard to the report for the past year, it showed how very difficult a year the Society had passed through. On a review of the year's work, however, the Council felt much satisfaction in being able to point to the continued progress, increased activity and extended influence of the Society's work.

During the year the Society had been called upon to widen its rôle in assisting the horticultural activity of the country. The changed conditions of shipping had gradually made themselves felt, and the call for increased production of home-grown food-stuffs had made itself more and more loudly heard.

The letter addressed to the Fellows, and sent out with the book of arrangements, showed that the Council anticipated the need conditions of today. A deputation, urging the adoption of measures to meet these conditions and offering the assistance of the Society, waited upon the Board of Trade and the Board of Agriculture in November last. The Order in Council of December 3, authorising Local Authorities to acquire land, break it up into plots, and distribute it amongst the inhabitants for the cultivation of vegetables, was due to the visit of that deputation.

The Society's war pamphlets had met a wide-felt need for simple information and instruction on matters of gardening, no fewer than 90,000 copies having been issued last year.

It had come to the Council's knowledge that the Society was being misapprehended by both Fellows and non-Fellows alike. References in conversation and in letters which reached Vincent Square

suggested in some cases inactivity and in others extravagance. Both these criticisms admitted of complete answers. If any truth existed in either charge its germ was to be found in the relation of one to the other, the Society having been as active as its financial conditions allowed. The country had this year made greatly increased National demands on the Society, but without supplying one penny of financial support through Government channels.

The Council was grateful for the loyal support the Fellows of the Society had given, and was confident it would be continued. At the close of the year the list of Fellows showed a falling off of only twenty-six. That the Fellowship of the Society could be thus sustained through the most difficult of all periods in our national history was a marked proof of the Society's strength and usefulness. He explained, however, that there were great numbers of Fellows on active service whose subscriptions were for the time being in suspension, involving a loss of £900.

In the earlier part of the year the Council was called upon to fill two vacancies in its own body, caused by the death of Mr. J. Gurney Fowler, and the resignation of Baron Bruno Schroder. To fill these two vacancies the Council co-opted Sir David Prain, the eminent Director of the Royal Gardens at Kew, and Mr. Frederick Hanbury, a well-known amateur gardener of great knowledge and experience. Later in the year they received the resignation of Sir Daniel Morris, who found it more and more difficult to get up to the meetings from Bournemouth. The Council accepted his resignation with very great regret. Sir Daniel's connection with the Society in an official capacity dated back to the time of the Society's leaving South Kensington and turning to the old Horticultural policy. In those far-away days Sir Daniel did youn's services as treasurer, and he would ask those present to prise a very hearty vote of thanks to Sir Daniel for his long and constant service. The Council had co-opted Sir Daniel a vice-president of the Society.

The Council had co-opted the Rt. Hon. James Lowther, M.P., Speaker of the House of Commons, to Sir Daniel's seat on the Council. Mr. Lowther was an ardent garden lover, hardly ever missing one of the meetings, and in these difficult days the Society was most fortunate in securing his cooperation and assistance.

Some statement relative to the Hall would doubtless be expected. When the demand for large buildings became acute, as it did last summer, and it came to the knowledge of the Council that the Military were seeking in all directions for large buildings, the Council felt there would be no reluctance whatever on the part of the Fellows to the Society's building being surrendered if arrangements could be made to protect the interests of the Society in so far as the urgent needs of the war would permit. The Hall was accordingly offered, the War Office met the Council gratefully and generously, and promised that the Society's work should suffer as little inconvenience and interruption as possible if the Hall were handed over to them. They further promised that another building should be provided for the fortnightly meetings, and asked if the Council had any preference in the matter. The Hall of the London Scottish Volunteers in Buckingham Gate having been the home of the Society's meetings from 1888 to 1904; it was felt that no better selection could be made as a temporary measure. In due course formalities were completed, the Drill Hall was given to the Society, and then, and not till then, did the Australians, who had acted most honourably throughout, think of entering into occupation. As regards terms for the occupation, the War Office promised that the Society should be left in practically the same position financially in respect of the building as it was in 1915. At the close of the occupation, the Hall would be handed back with compensation for dilapidations.

The Red Cross Sale held in June had proved a greater success than could have been anticipated, and £2,205 had been sent to the Red Cross Society. The Council was deeply grateful to all the Fellows and friends of the society who supported it, and especially to those who had so generously purchased at the sale.

The new laboratories at Wisley had been completed during the year, and work, with such staff as was available, had commenced. The work in the gardens had naturally been very much handicapped for want of labour. They were, however, quite as largely visited as usual.

In deciding to suspend for this year the shows at Chelsea and Holland House the Council had responded to what they plainly saw to be a sacrifice demanded of the society on national grounds. The Council felt sure they would have the support of the Fellows in so doing. It was, therefore, regrettable that a few letters had recently reached Vincent Square, in a somewhat complaining tone on this score. The suspension of the spring and summer shows, and the transference of the fortnightly meeting to the Drill Hall were only temporary measures during the war, after which it was hoped to resume the usual programme, so that Fellows might confidently look forward to a return of their full privileges.

The Dry Bulb Show was a marked success. It was hoped that it, and the Conference held on the same day, would make their influence felt in a greatly increased home-grown bulb industry in the future.

During the war the Council felt that a certain measure of curtailment in the building-up of the Lindley Library was necessary, as economy must be brought to bear upon every branch of the society's work; for one reason, amongst others, that there was a certain falling off in the society's income, both from subscriptions and dividends, and that the increased work thrown upon the different departments, both at Vincent Square and at Wisley, as a result of war conditions and war needs, was involving extra expenditure which previously did not fall upon the society. No rare or valuable book would, however, be allowed to go by if offered at a reasonable price.

The Council felt sure that the Fellows and the trade would support their action in suspending, for the time of the war, the issue of further Gold Medals in the actual metal in view of the Government's requirements that it should be used as little as possible. The Gold Medal would continue to be awarded as heretofore, and Medal Cards would be issued to recipients, but not the medal itself.

It had been found necessary to put a check upon the indiscriminate use of the vases by asking of all exhibitors a small deposit when borrowing them. At the close of the meetings exhibitors were asked to return the vases to the attendant in charge, when the deposit money would be refunded, less the value of any vases broken or lost.

It would be hard to imagine a sadder blow to the Society than that so unexpectedly sustained by the sudden death of the treasurer, Mr. J. Gurney Fowler, at the beginning of the year. He had for many years been a familiar figure to all associated with the fortnightly meetings, and especially those of the Orchid Committee, of which he was chairman. As a member of the Council for 18 years, his strength of character and his unflinching decisions were a great support. He handled the finances in a manner which contributed very largely to the stable position which the Society now held, and the heavy work which fell upon him in connection with the International Exhibition of 1912 will always keep his memory green in horticultural circles.

Major C. G. A. Nix, a member of the Council, and Chairman of the Fruit and Vegetable Committee, had accepted the office of treasurer as Mr. Gurney Fowler's successor. Major Nix was at present absent on military duties, and, in the interim, the speaker (Sir Harry Veitch) was acting in his place.

As already stated, owing to many of the subscriptions of Fellows on active service being in suspension, there was a decrease of income under this head of nearly £900. The impending military occupation of the hall had also interfered with the income from lettings to the extent of about £1,000. In these circumstances the balance-sheet was awaited with a certain measure of anxiety. It was with no little relief that a cash balance of about £1,700 remained, but it was only right to remark that at the beginning of the year the balance in hand was £2,700, so that there had really been an actual decrease of £1,000

in the twelve months. £8,000 of the income had been devoted to the building of the Wisley Laboratory, which is now completely paid for except the comparatively small amount of £870 called "retention money," which would fall due in May next.

Though the Society stood to-day above high-water mark, it would not be long before an adverse balance would appear if, year by year, the income thus continued to decrease.

He formally moved the adoption of the report, and called upon Dr. F. Keeble to second it.

Dr. Keeble said that he was glad to have this opportunity of giving some account of the activities of the Royal Horticultural Society during the past year. It would be recognised that the work had been carried out under very difficult conditions. Of the Wisley staff, every member of military age, except one, the vegetable and fruit foreman, whom they regarded as indispensable, had been released for military service. Still, even with their depleted staff, they had been able to carry on not only the routine work of the gardens, but also a certain amount of research. Mr. Ramsbottom, who had been released for military service, was investigating the diseases of Narcissus, and for the information of any Daffodil enthusiasts who might be present he would say that three distinct diseases had already been discovered.

The seriousness of the situation as regarded food supplies had been recognised by the Society at an early date, and the record of their activities in this direction was one of which they might well be proud. On the outbreak of war, propaganda for the increased production of home-grown foodstuffs was undertaken, and work in this direction was extended until the Society received evidence that the Government itself was taking up the work. He regretted, however, that Government action fell short of what the situation appeared to demand, but the excuse might be urged that the overworked officials of the State could hardly be expected to take the same detailed interest in such work as those who could have devoted their whole energies to the task. He could claim that the present far-reaching scheme for the use of uncultivated land which the Government had instituted all over the country, was the outcome of a deputation sent by the Society to wait upon the authorities. The Society further undertook and carried out with the greatest success the issuing of a series of simply written and useful pamphlets, each dealing with vegetable culture; and much advice has also been given to enquirers, both at Wisley and at Vincent Square.

In further reference to the scheme for the cultivation of waste land, a second deputation waited upon Sir Sydney Olivier of the Board of Agriculture with an offer to supervise the thorough and efficient cultivation of all waste land appropriated to the purpose. He regretted that they were still awaiting a reply to their offer. They had, however, themselves made a move in this direction by issuing an urgent appeal to all professional gardeners to do what they could to help and advise allotment holders in their own districts, and to place at their disposal surplus seedlings of such crops as Brassicas. Another piece of work which the Society had carried out was the supplying of plants, vegetable and flower seeds and bulbs to military camps in France, and they were now awaiting the decision of the War Office as to whether the Society should be enabled to continue this useful work during the coming season. He had great pleasure in formally recording the adoption of the report.

At this stage of the proceedings the chairman announced the names of the recipients of the Victoria Medal of Honour. They were as follows:—

The Hon. Vicary Gibbs, W. Watson,
E. A. Bowles, W. Slocock,
P. C. M. Veitch.

The chairman invited comments on the report, and the Rev. Joseph Jacob said he would ask the members of the Council whether they did not consider the time had arrived for a revision of the charter and by-laws. He urged that they by altered so as to give greater power to the various committees, to which some of the work now done by the Council might be delegated.

He suggested that the procedure at the annual meeting be amended so as to give the members rather more voice in the decisions come to at these meetings. For instance, he himself was not satisfied with the expenditure upon books for the Library, which he considered too small; but there was at present no opportunity for members to control the policy adopted in this or any other matter. Seeing that the Library Committee only met once last year there had been very little opportunity for them to consider the purchase of any books they might require. He suggested that the Council might consider the advisability during the coming year of acquiring more rare and valuable books, many of which were at present leaving these shores. Again, Daffodil growers had been disappointed that the Council had made no provision for money prizes at the Daffodil Show. He also regretted that the Daffodil Year-book had not been published in 1916, and asked that that publication might be resumed.

Mr. Oak, Southampton, rose to support Mr. Jacobs in his remarks on the subject of the library, and suggested that the society should announce in its publications the names of books needed for the library, as this might result in many cases in gifts of such books by Fellows who possessed more than one copy.

Mr. R. W. Wallace regretted that there was no indication in the report that any money had been invested in the War Loan. (The acting treasurer, Sir Harry Veitch, replied to this that it was proposed to invest £10,000. Mr. Wallace, continuing, said he considered this sum inadequate, and that the amount should be at least £25,000, in view of the fact that the investments of the society amounted to more than £42,000. It was reasonable to suppose that on the securities now available the bankers of the society would place at their disposal the sum he had mentioned at a favourable rate; and he would answer for it that such an action on the part of the Council would be approved by every Fellow of the society. He proposed that the following resolution be submitted to the Council:—"That in the opinion of this meeting the Council would be well advised to increase the society's investment in the War Loan from £10,000 to £20,000."

Mr. Thomas Lewis supported Mr. Wallace's contention, and urged that to invest every available shilling in the War Loan was the patriotic duty of the society.

Mr. Oak proposed an amendment:—"That the matter be left to the discretion of the Council." This was negatived, and the resolution was adopted after further discussion.

Sir Harry Veitch proposed the election of the president, vice-presidents, members of the Council, and officers, as published in the list of nominations, which was agreed to.

NATIONAL CHRYSANTHEMUM ANNUAL GENERAL MEETING.

FEBRUARY 5.—The annual general meeting of the National Chrysanthemum Society was held on the 5th inst. at Carr's Restaurant, London. Mr. Thomas Bevan presided.

The annual report of the Executive Committee was presented, the following being extracts:—

EXTRACTS FROM THE REPORT.

After the successful experiment of 1915 the Committee were able to make arrangements for a Show in 1916 adjusted to the requirements of wartime and yet ensuring an exhibition which should be a worthy successor to those of previous years. Her Excellency Countess Chinda, wife of the Japanese Ambassador, opened the Show with a few well-chosen remarks on an introductory speech by the President. To commemorate this unique occasion the Society's medal, suitably engraved, was subsequently presented to Countess Chinda, and to the President. The entries at the Show were slightly lower than in the previous year, but the quality of the blooms staged certainly showed no decline. Sixty meetings of the Floral Committee were held, and 90 new varieties were staged, as compared with 102 during the 1915 session and 103 during the 1914 season. Of the 90 varieties which were staged, 24 were awarded First-class Certificates, 40 were Commended, and 26 were Commended as a Market Variety. 3 received the Award for Colour, and the Committee desired to see several varieties again. During the season there was not a single new variety of an Incurved Chrysanthemum staged for the consideration of the Committee.

The Floral Committee decided to recommend the Executive Committee to include a class in the next season for English-bred Pompons, and this recommendation has been adopted. The Floral Commit-

hens the grain increases egg production; ground fine, husks included, they form one of the most important fattening poultry foods. Eggs in milk show their appreciation of oats by giving an increased yield for the benefit of the lambs.

Directly a change in the weather takes place and the land is dry enough, sowing should commence, as the early sown plots are much more certain of success than those sown in April or May, for the roots obtain a firmer hold of the soil, and thus withstand drought, which is all too often experienced in June and July.

The preparation for an Oat crop is purely a question of circumstances. On large farms where a definite course of cropping is the rule, the rotation for the Oat crop is a settled problem. On small farms, or where a few acres are attached to the garden, the circumstances are entirely different: the Oat and other crops have to be managed with unusual care.

If the previous year's Wheat crop was successful, and the land is clean, Oats will follow admirably, and so they will after sheeped Turnips or Swedes. A Mangold or Potato crop is also a good preparation for Oats.

A stale fallow, autumn-ploughed, is an advantage, as the seed "goes in" well, the surface tith being so satisfactory after a spell of frost and a good seed bed is of great importance. When the seed is "muddled in," owing to an unsatisfactory preparation of the soil, perhaps occasioned by showery weather, a bad start is made.

Good seed should weigh 40lbs. per bushel, and of a deep black colour in the Tartarian variety. The ears should be short and thick, not long, narrow, and light in colour and weight.

There are various methods of sowing Oats. Drilling is perhaps the best; the seed is buried at a uniform depth. Where a large acreage has to be sown, a broadcaster is employed, which covers from 16 feet to 20 feet of ground. A Massy-Harris cultivator, with a seed box attached, is also a good method of sowing. The seed is dropped evenly in front of the cultivator tines, which bury the seed effectively.

By this method of sowing the land does not require so much harrowing afterwards. Iron or wood harrows should be drawn over the plot at least three times if the soil is fairly dry, as it should be, to effectively bury the seed and under the surface line, taking care to finish off the furrows thoroughly to ensure their not being left too deep to interfere with the self-binder at harvest time. If the surface soil is "cloddy," a roller should be used to make a fine surface; the Oat plant emerges from the soil so much more evenly through a fine surface. Stiff soil should not be left in a rolled-down condition. It is so liable to bake and callus on the surface during an immediate spell of dry weather, which hinders even growth. Always finish off such soil with the harrows.

SUGAR BEET

Last year I grew several acres of this root for sugar production, but owing to shortage of labour or some other cause, the factory to which I intended to send the roots was closed. I am now feeding the roots to fattening cattle with satisfactory results: the roots apparently contain much saccharine or feeding matter, aiding considerably the putting on of flesh. So encouraging was this crop that I hope to extend it in the future.

A fairly heavy bulk of roots can be grown with no more trouble or expense than Mangold Soil that will grow the latter root will grow Sugar Beet. Soil containing few stones is an advantage, as the roots being to get one top root. Loam of medium texture, heavily manured and deeply ploughed in the autumn, would be an ideal site and a good preparation. To obtain a good tith in the spring, which hastens the germination of the seed, the cultivator should be freely used. 3 lb. of seed per acre, drilled as Mangold, and at the same time, is sufficient *E. Molynear*.

*NEW POSTAL RATES.—Contributors and correspondents are reminded that under the new postal rates, letters bearing a penny stamp must not weigh more than one ounce. The postal charge for letters exceeding one ounce, but not exceeding two ounces, is twopence, and thereafter at the rate of 3d. every two ounces.

Obituary.

EDWARD J. TRESSEDER.—We regret to learn that Mr. Edward J. Tresseder, only son of Mr. J. Tresseder, late proprietor of Heath and Son, Musgrave, died at Cheltenham on the 3rd inst., of cancer, aged 42 years. Mr. E. J. Tresseder for many years represented Messrs. Harrison and Sons, seed merchants, Leicester, and latterly was employed by Messrs. Watkins and Simpson.

JOSEPH OLIVER.—We learn with regret that Mr. Joseph Oliver, a well-known Northampton gardener, died a fortnight ago, aged 80-1. He retired from the duties of bailiff at Estington Park in 1910, having been appointed gardener there in succession to his father, who filled the position from 1825 to 1882. In 1882 Mr. Oliver commenced work with his father, and never left Estington; his brother William also spent his life on the same estate. In his early days Mr. Oliver was a keen lover of florists' flowers, and when an apprentice he cultivated

and cow dung, apart from their physical effect on the soil, the following table, from Griffiths' *Treatise on Manures*, shows that horse dung is the rich in plant foods:—

Sheep dung gave	244 lb. of barley
Pig dung gave	236 " "
Horse dung gave	226 " "
Cow dung gave	167 " "

GARDENER'S ILLNESS.—X. F. Z. Gardeners in permanent employment are usually paid their wages during temporary illnesses. In respect to what you say about exceptional circumstances, it is, of course, possible that in isolated cases the privilege may be abused, but the employer seldom lacks means of informing himself of such instances.

HORSE CHESTNUT FAILING TO FLOWER.—C. O. Without seeing the Horse Chestnut tree it is difficult to account for its non-flowering. Non-flowering is, however, often the result of the tree growing in an unsuitable soil or position, and insect attacks usually follow the unhealthy condition. In two cases of non-flowering in northern London good results followed substituting fresh loam for the poor, exhausted soil in which the trees were growing. In another instance an escape of gas in the soil kept the trees in a sickly condition, when they were attacked by the wool leopold moth, and rarely produced flowers. The trees, five in number, are now in a sound, healthy condition, and flower freely.

NAMES OF PLANTS.—J. E. L. 1, *Phyllanthus nyctaginis*; 2, *Dracaena Godseffiana*; 3, *Allamanda Hendersonii*; 4, probably *Hibiscus Rosa sinensis*. All require warm-house treatment in winter, but may be placed in the conservatory or greenhouse in summer if necessary.

PEACHES SUITABLE FOR A CLAY SOIL IN HUNTINGDONSHIRE.—F. de H. B. The following varieties are all suitable for your clay soil: *Alexandra* Noblesse, *Barrington*, *Goshawk* Noblesse, *Prince of Wales* and *Royal George*.

SEED POTATO FOR PLANTING ONE SQUARE ROD OF GROUND.—*Beginnion*. The quantity of seed tubers will vary according to whether the varieties are early, mid-season, or late. Early varieties are usually planted in rows made 2 feet apart, and 1 foot apart in the rows, and you would require a little more than one peck of seed (16 lb.), taking the average weight of the individual tubers at 2 oz. For mid-season varieties 1½ gallon (10½ lb.) will plant one rod of land; whilst for late or main-crop varieties rather less than that amount (7½ lb.) would suffice.

SILVER LEAF AND SOAR DISEASES.—J. S. No certain cures for silver leaf is known. Some who have made the disease the subject of careful investigation have tried the injection of sulphate of iron into the roots, stem, or branches of the tree, or mixing it with the soil; but, unfortunately, though in some cases an improvement was noted, it was not completely established that it was due to the sulphate of iron, and the only point on which all were agreed was that, whether it was a remedy or not, it could in no circumstances be considered a cure in the sense that it rendered the tree immune from future attacks. Spraying has been found completely unsatisfactory, even with strong Bordeaux mixture. Most growers find that the only means of checking the spread of the disease is to cut back the affected trees well beyond the first discoloration of the wood, and burn the cuttings; but this is scarcely a solution of the problem. Pear scab is caused by the fungus *Venturia pirina*. Spray diseased trees with dilute Bordeaux mixture, not more than half strength, when the buds are beginning to open, repeating the operation when the petals are falling from the blossoms, and again when the young fruits have attained the size of Peas. The trees should also be syringed thoroughly in winter with a solution of sulphate of iron.

Communications Received.—F. C. Colburnson, San Francisco—H. V. D. G. H. Miss J.—H. S.—W. D. Dr. W. B. H. R. H. M. (Thanks for plan). R. P. A. W. A. J. B. B. I.—D. E. D.—W. J. J.—R. P. R.—D. B. A. Mrs. M.—E. M. E. F. H.—A. D. W.—S. A.—S. B. A.—A. O.

MR. EDWARD J. TRESSEDER.
(See Obituary notice in last issue.)

Dalbus in his leisure hours. Vegetables were also well grown by him, and he possessed old and very estimable strains of these. Long before Antirrhinum became popular bedding plants, these flowers were largely used in the flower garden at Estington.

ENQUIRY.

I shall be obliged to any reader will inform me where I can obtain Allbagen, a composition for painting trees to prevent rabbits from moping the bark. N.

ANSWERS TO CORRESPONDENTS.

COW AND HORSE MANURES.—J. M. C. You ask what is the growing power of one ton of horse manure compared with one ton of cow manure. The question does not admit of a definite answer, for, as you are doubtless aware, the effect of the respective manures varies according to the character of the soil. For example, cow manure would be most beneficial on light soils, because of its value in holding moisture and giving the soil a greater consistency. Horse manure would be most valuable on heavy land, as it would tend to lighten the texture, enabling air to enter more freely. With regard to the manurial value of horse

(Continued from page ii)

GLAMORGAN COUNTY COUNCIL. HORTICULTURAL DEMONSTRATORS AND ADVISERS.

The Glamorgan County Council invite Applications for the Appointment of a Horticultural Demonstrator and Adviser for assisting the proprietors of Cottage Gardens, Allotments, and Small Holdings in such areas as will from year to year be selected within the Administrative County of Glamorgan.

Applicants must possess an Examination Certificate of the Royal Horticultural Society, and have served as apprentices to gardeners, and have held situations in which they were in charge of and responsible as Foreman or Head Gardeners for Flowers, Fruit, vegetables, and household work.

Experience as journeymen in vegetable gardens will be deemed an additional qualification.

Applicants must provide and be able to make a liability of £5s. per week, with an allowance of the rate of £5 per annum in addition for the upkeep of a liability. The appointment will be for one year, subject to one month's notice on either side, and will be renewable annually.

The person appointed will be required to give his whole time to the service of the county, and to reside there from time to time directed.

Applications, stating previous experience and age, with copies of three recent testimonials, must be received by the Chief Education Officer, Glamorgan County Hall, Cardiff, on or before 10 a.m. on the 7th day of March, 1917.

T. MAXSELL FRANKLIN,
Clerk of the County Council.

Glamorgan County Hall, Cardiff.
12th February, 1917.

WANTED, HEAD GARDENER and **UNDER GARDENER** (ineligible), used to Fruit, Flowers, and Vegetables, good wages, to practical man, house and vegetables bound.—Write wages required and full particulars, F. L. RAWSON, Barwell Court, Chessington, Surrey.

WANTED, HEAD GARDENER, for small garden, good cottage, wages according to experience.—Apply, REV. P. ARMITAGE, Nethfield Vicarage, Henley-on-Thames.

WANTED, GARDENER (HEAD) one or other kept, compact place, must be a worker and thoroughly understand Vegetables, Apples, Fruit Trees, and Ferns; comfortable house, 5 rooms, heated by radiators, fuel, light, and vegetables; good references, state wages.—MRS. J. H. MOORE, Hillfield, Leatherhead.

WANTED, WORKING HEAD GARDENER, for 4 or 5 (temporary), must be thoroughly competent with glass and outdoor work. Write, stating full particulars, to MRS. C. PHIPPS, Chalfont, Westbury, Wilt.

WANTED, HEAD WORKING GARDENER, also **SECOND**, good references, experienced in all branches, inside and out. State wages and full particulars.—Apply, C. H. ALLEN, Helvidale, Weston, Kent.

WANTED, GARDENER (HEAD WORKING), for duration of war, must be fully experienced in all branches, inside and out. State wages expected and full particulars to MRS. CROZIER, Weald, 14 month, Isle of Wight.

WANTED, immediately, GARDENER (HEAD WORKING), experienced, and 2 **UNDER GARDENERS** (ineligible) only to apply for girls' school, cottage for Head Man, good wages. Apply, by letter, stating age, experience, and qualifications, to MISS BERRYON, St. Monica's, Burch Heath, Tadworth, Surrey.

WANTED, SINGLE-HANDED GARDENER, boy kept to give help.—C. H. CAVE, Red way Hill House, Mangotsfield, near Bristol.

WANTED, by a Lady, a good SINGLE-HANDED GARDENER, with help occasionally, in eligible for Army.—MRS. TOLE, Church Speen Lodge, Newbury, Berks.

WANTED, GARDENER (SINGLE-HANDED), boy assists, small Greenhouse, large garden.—N. Priory House, Gosdole.

WANTED, GARDENER, for permanency (SINGLE-HANDED), private garden, ineligible Army, wages 30s. or 20s. and cottage.—Apply, The Lawn, Colbrook.

WANTED, SINGLE-HANDED GARDENER, Permanency, Kitchen and Flower Garden. Glass; help given spring and summer; good wages to competent man.—CHURCHILL, Clarendon Crescent Road, Epsom.

WANTED at once, Experienced SINGLE-HANDED GARDENER (male or female), garden 3 acres, 2 houses, very good wages to suitable person. Write, making appointment, to Grove End, Grove Park, Chiswick.

WANTED, GARDENER, Man or Lady; SINGLE-HANDED, cottage; 5/3 rates Glass. State full particulars, BRIG-GENERAL GIBBON, Hughenden, Peterborough, Salisbury.

WANTED at once, SINGLE-HANDED GARDENER, over military age or discharged from Army, (but do only strong and active); good Vegetable and Fruit grower. State wages and full particulars, COLONEL PARRY, D.S.O., Peigween, Rhododan, Flint.

WANTED, WORKING GARDENER; Flowers, Shrubs, Rock Garden, no Kitchen; good assistant, 25s. and out, cottage and wood.—MRS. JOHNSTONE, Bignor Park, Pillingborough, Sussex.

WANTED, GARDENER, ineligible; Flower and Vegetable Garden, small Greenhouse, willing to be useful, boy under; cottage and garden.—Crownville Cottage, Tipton, Somerset.

MIDDLE-AGED, Handy Married GARDENER wanted for small place in Berks, 22s. a week, with cottage, would have to bring wood and coal into the house and attend to the pumping engine daily before breakfast, must be a good Vegetable grower and understand Trees and Shrubs, no Glass and very little Flower Garden, will assist look after house when empty. Address, by letter, MRS. A. F. WALTER, St. Catherine's, Bear Wood, Wokingham.

WANTED, GARDENER; good vegetable grower, help given, small cottage and garden close to work.—Patrolists to MRS. BROOKS, Keybold House, Frome, Somerset.

ASSISTANT GARDENER wanted, at White Oak, Sissing, Sturley, Kent, wages according to qualifications, war bonus; men on Government work not eligible for H.M. Forces need not apply. Apply to the MATRON.

WANTED, GARDENER (UNDER) SINGLE, handy, outside work, good wages, incl. cottage and references to WIGGINS, Holly Hill, Bostwick, Surrey.

WANTED, UNDER GARDENER, for Kitchen and Pleasure Garden, if married rooms provided, Apply, H. R. INMAN, The Grange, Hampstead Heath, London.

WANTED, experienced HEAD GARDENER (likely) to take charge of Gardens, no Glass, Vegetables and Fruit grown in quantities to supply large establishment; also able to organise installed labour and to instruct classes of boys and girls in practical horticulture; salary starting £150, or £100 resident. Apply, stating qualifications and experience, J. H. BARKER, Beckles School, Petersfield, Hants.

WANTED, immediately, HEAD WOMAN GARDENER and 2 **ASSISTANT WOMEN GARDENERS** for girls' school; furnished cottage provided, salaries £100, £70, and £60 respectively. Apply by letter, stating experience and qualifications, to MISS BRIDGON, St. Monica's, Burch Heath, Tadworth, Surrey.

LADY GARDENER wanted at the Children's Home, Hove, W. (under the Metropolitan Asylums Board), about 3 acres, including 2 acres Vegetables; no Glass. Apply, stating age, experience, and wages required, to the CLERK TO THE METROPOLITAN ASYLUMS BOARD, Embankment, London, E.C.

10th February, 1916.

WANTED, for Large Gardens in the Midlands, TWO LADY GARDENERS, one inside and one out, to work under Head; must be experienced, furnished lodgings, and 30s. per week salary.—Write, T. H. Box 18, 41, Wellington Street, Covent Garden, W.C.

WANTED LADY GARDENER, with some experience, for the Houses, no Boy. State wages and experience to R. ALLDAY, Chancellor House, Timbridge Wells.

WANTED, WOMEN GARDENERS, inside and out, both cool, light, and vegetables; half-day Saturdays, duty paid. Wages and particulars to W. R. WRIGHT, The Gardens, Ashby Saint Ledgers, Rugby.

WANTED, LADY UNDER-GARDENER; work mostly Lady Gardener and share furnished lodge with her, and be on electric light engine.—MISS MRS. HAMILTON RUSSELL, Yalvington House, Wincanton, Somerset.

WANTED, FOREMAN GARDENER, in Northumberland, ineligible, experienced Inside and Out, good wages given, as may be agreed upon, both and usual allowances.—Apply, stating age and full particulars, to X. D. COWAN, West Lillburn, Alnwick.

WANTED, FOREMAN, of good experience, to take charge of Glasshouses; Bothy; good wages.—A. HENDERSON, Mableton Park Gardens, Tonbridge, Kent.

WANTED, good FOREMAN for Pleasure Grounds, Shrubs, Flower Beds, Herbaceous Borders, &c.; must have good experience; wages 32s. weekly, with cottage.—Apply, with full particulars, to W. GROOM, The Gardens, Upper Gattin Park, Merstham, Surrey. Will former applicants please apply again?

WANTED, a FOREMAN GARDENER, for large Gardens in the Midlands, to work under Head; must be well up in Grapes, Peaches and Chrysanthemums; wages 30s. per week and good Bothy.—Write, S. M. Box 19, 41, Wellington Street, Covent Garden, W.C.

WANTED, good KITCHEN GARDENER FOREMAN, experienced in all kinds of Fruit and Vegetables, early and late forcing, salads; wages 32s. weekly, with cottage.—Apply, with full particulars, to W. GROOM, The Gardens, Upper Gattin Park, Merstham. Will former applicants please apply again?

WANTED, GARDENER, as Foreman or Journeyman, ineligible; Glass; experience; character.—Apply, W. COPLEY, Thorntonhouse, Cheshire.

WANTED, MAN for Pleasure Ground; ineligible or discharged soldier, wages 25s. per week.—Apply, WM. HOWE, The Gardens, Park Hill, Streatham Common.

WANTED, a MARRIED MAN, experienced with Cucumbers and Fruit under Glass; good cottage near Garden.—Apply, with particulars of experience, wages expected, to H. ROGERS, Reddisham Gardens, Woodbridge.

WANTED, good MAN; Inside and Out; take duty, good wages and overtime paid, hours 7 to 5, 1 p.m. Saturdays, fare paid.—Apply, with references, to J. M. HUGHARDS, Bookhampton Park Gardens, Andoverford, Glou.

WANTED, an IMPROVER, with some experience; age about 17, wages 17s. per week, Bothy, milk, and vegetables; 2s. 6d. for Sunday duty.—Apply, W. WEXMAN, Huckleton, Dorchester.

WANTED, IMPROVER (INSIDE), under 18 years, 17s. per week, 2s. war bonus; good Bothy, milk, and vegetables, half day on Saturdays; travelling expenses paid.—Apply, with copies of references, to JAMES B. ALLAN, Osberton Gardens, Worksop, Notts.

WANTED, a good, strong Youth as IMPROVER, for general inside work; good wages, with Bothy, milk, and vegetables.—Apply, stating wages and experience, W. H. ALLEN, Minley Manor Gardens, Farnborough, Hants.

WANTED, IMPROVER (16), for Inside; wages 18s. per week, Bothy, milk, vegetables, alternate duties; duty, overtime, and fare paid.—D. ROBERTS, Prestwood, Longborough.

WANTED, IMPROVER for Kitchen Garden, able to take light duty.—Apply, with particulars and wages required, to HEAD GARDENER, Blethen, Woodstock, Oxon.

WANTED, IMPROVER; Inside the Houses and out, age about 17, wages 17s. and Bothy. E. MORGAN, Wassand Hall Gardens, Hants.

WANTED, TWO YOUTHS (16 to 17) for the Houses, wages 18s and Bothy, duty and overtime paid; 1 o'clock Saturdays.—C. GARRAIT, Camwell Hall Gardens, Sutton Coldfield, Birmingham.

WANTED, YOUTH, age about 16, for Kitchen Garden chiefly; 18s. per week; Bothy, milk and vegetables and attendance.—Apply, J. SHENNAN, Haldenby, Northampton.

WANTED, LADY, about 16, or discharged soldier, for Kitchen Garden chiefly; duty, state wage, with good Bothy, &c.—H. BROWFIELD, Ellsfield Manor Gardens, Basinstoke, Hants.

WANTED, strong, active YOUNG WOMAN for the Houses, with some knowledge of Tomatoes, Cucumbers, wreath-making, &c.; good wages to suitable person, no Bothy. State wages expected, with particulars, to A. L. STATHAM, Tony-Cod Gardens, near Hlandun.

WANTED, TWO YOUNG WOMEN for Glass Department, good modern Bothy.—Furnishers of experience, J. FODMORE, Manor Gardens, Little Berkhamstead, Hertford.

WANTED, MAN or WOMAN to look after two cows and poultry, fill up time in Garden.—Reply, stating wages, &c., to GARDENER, Feltham Lodge, Feltham.

TRADE.

WANTED, WORKING FOREMAN, for branch Nursery, Plant and Forest Trees only; house and garden provided, must be eligible for Army.—Apply, with testimonials and state wages required, to JOHN PERRINS & SON, 52, Market Square, Northampton.

WANTED, Experienced Man, ineligible for service, as FOREMAN of Alpine and Herbaria, nursery Department.—Full particulars as to reference, wages, &c., to KINGS ACRE NURSERIES, LTD., Hereford.

FOREMAN for Fruit Trees and Roses. Please state wages required, age, and send references.—WILL TAYLER, Hampton, Middlesex

WANTED, a good PROPAGATOR and GROWER, one used to Roses, Clematis, Chrysanthemums, and General Nursery Stock.—Apply, with particulars, as to wages, &c., to THE DEVON ROSERY AND FRUIT FARM, LTD., Torquay.

WANTED, good KNIFEMAN; well up in Budding, Grafting, and Training of Fruit Trees; permanent situation to reliable man, ineligible.—Full particulars as to references, wages, &c., to JOHN PERRINS & SON, Billing Road Nurseries, Northampton.

WANTED, Two Good KNIFEMEN, experienced in Budding, Grafting and Training of Fruit Trees, must be ineligible to serve. Also Two Experienced MEN for Rose Department. Apply with particulars, as to wages, &c., to KINGS ACRE NURSERIES, LTD., Hereford.

WANTED, for large Midland Nursery, an experienced Budder and Graftor, with a good knowledge of Rhododendrons, Roses and Fruit Trees, also two experienced KNIFEMEN. Apply by letter, stating age, references, and wages required. X. B. 21, 41, Wellington Street, Covent Garden, W.C.

WANTED, a PRUNER for Bush and Tree, and later for Grafting for two months, or, if preferable, for a permanent, age above 45 or ineligible; good wages and cottage. Write A. B. Box 10, 41, Wellington Street, Covent Garden, W.C.

WANTED, Two or Three MEN (one or two) as BOBBING GARDENERS (HIBBEN), No. 50, LITTLEHAMPTON.

Price List of Latest Novelties on application.—**J. C. JENNER**, Lynwood Nurseries, Rayleigh, Essex.

MISCELLANEOUS.

BUSINESS METHODS.—Experience in the world of commerce shows that there are two ways of conducting a business, the one being to charge as much as possible for what is sold, exacting a high rate from one customer and a low price from another, and the other to have a fixed price for everything and stick to it. The first method is to be condemned from every point of view, but mainly because it punishes the best purchasers, those who are ready to pay what is reasonably asked when the goods are marked in plain figures. The *Gardeners' Chronicle* adopts the alternative. It guarantees that its advertisement rates are not altered for any customer, big or little, old or new; all pay the same price for a similar thing. Consequently, whilst it is not possible to grant concessions, it is nevertheless the privilege of the paper to be in the position to assure each advertiser that he pays no more than anyone else.

The Gardeners' Chronicle

Do Not Forget the Gardener-Soldiers.

"Many thanks for the *GARDENERS' CHRONICLE*, which I have received safely each week through the kindness of Lady Theodora Guest. You will see that I am now in Mesopotamia. The *CHRONICLE* is very welcome to me out here; it seems good to read all the news in the old paper, and surely the *GARDENERS' CHRONICLE* is the king of all gardening papers."

This letter was sent us by a soldier in the Mesopotamia Force. YOUR soldier friend, who was a gardener before he went to the front, is a gardener still in sympathies and interests. HE longs to know what is going on in the gardening world now, and has no means of knowing unless YOU help him. Send him the *GARDENERS' CHRONICLE*. Keep him in touch with current gardening affairs. He will be most grateful for such an act of friendship. Send us a subscription for half-a-year—8/9—and we will take all the responsibility of sending the paper regularly to your friend, also reminding you punctually when the subscription is about to expire.

Write to us now, and give us his address.

DIRECTORY AND YEAR BOOK.

We much regret that the publication of the Horticultural Directory and Year Book for 1917 has been delayed by unforeseen and unavoidable circumstances. First, the difficulties in regard to printing and paper supplies have increased greatly of late; and secondly, the number of corrections that have to be made this year is altogether unusual, owing to the fact that so many gardeners have joined the Army. To those who have already sent us prepaid orders we offer our apologies for the delay, and assure them that everything possible is being done to expedite publication.

GARDENERS' CHRONICLE, Ltd.,

ORCHIDS,

Clean, well-grown and cheap, also Many Rare and Choice Varieties. STOVE AND GREENHOUSE PLANTS OF ALL KINDS. Kindly send for Catalogue.

JAMES CYPHER & SONS, Exotic Nurseries, CHELTENHAM.

CARNATIONS. PERPETUAL FLOWERING.

FOR SALE, good clean plants, grown in 3in. and 6in. pots, well broken ready for potting. Golden, Enchantress Supreme, White Enchantress, White Wonder, Boston, Mikado, Mayday, Scarlet Scrolling, Enchantress, salmon Enchantress and other good varieties. 4/- per dozen. Cash with order. MAYTHAM GARDENS, ROLVENDEN, KENT.

ROSES

(Vol. 10 of PRESENT DAY GARDENING), by H. R. DARLINGTON Edited by E. HOOPER PEARSON, Managing Editor of "Gardeners' Chronicle." A good practical book for all Rose lovers. Contains much valuable information. In full-page coloured plates. A double volume. Price 2/10, post free. Special presentation edition with beautiful cover design, in cloth gilt, gilt top, price 3/10 post free. THE PUBLISHER, "Gardeners' Chronicle" Offices, 41, Wellington Street, Covent Garden, London, W.C. NOW READY.

Root & Stem Vegetables

WRITTEN by the late Alexander Dean, will be a valuable companion to the grower of Vegetables. It has a calendar of operations that will prove a useful guide to both the amateur and professional gardener, and the many hints given in the chapter on growing for Exhibition are invaluable. The work is beautifully illustrated by 8 plates in colour. Price 1/10 post free.

SEEDS FOR 1917.

It is none too early for garden lovers to think of seeds, but be sure the seeds you buy are seeds of quality. It is a gardening axiom that

RYDERS SEEDS

are the best, and despite the fact of a War Time price of 1/6 per packet, orders for these famous Flower and Vegetable seeds are daily growing in volume. Seeds of quality cannot now be supplied, even by Ryders, in Penny Packets.

Ryders Illustrated Seed Catalogue Free.

Ryders 1917 Catalogue contains a large number of choice varieties not found in other lists.

"Britain's Best" Tomato. The finest Tomato ever introduced.

Ryders New Snow-tail Scarlet Radish. A remarkable new Three-podded Pea—"Thousandfold."

A splendid New Oval-shaped Beet. Novelties for 1917 include the New Prince Sweet Peas (Pink, Pale Blue and V. olet).

A Wonderful new strain of Hybrid Cinerarias. The "Asterum" in four lovely colours. New Cyclamen, Mauve Queen. New Hybrids of Trollius.

Send a post-card to-day for your free copy of this Catalogue. Remember the one and only address and beware of imitations—no agents.

RYDER & SON, Ltd., Seed Specialists, ST. ALBANS.

Grow Your Own Food by Sowing Ryders Famous Vegetable Seeds.

A. F. DUTTON'S Noted Carnations.

Strong flowering plants in 5in. pots. In 6 good Standard varieties. 15/- per doz., 96/- per 100. In 6 good Novelties. 20/- per doz., 128/- per 100. Packed free for cash, carr. forward.

LILIES IN 1916.

AS far as the southern half of England is concerned, 1916 was both and nurtured in rain, while in adolescence and decay its footsteps were dogged by lowering clouds and leaden skies. Under the circumstances, no amateur of Lilies is likely to have shed any tears over the passing of such a depressing year, and the memory that can recall anything like it must be a tenacious one. It is, perhaps, needless to say that the season was an exceptionally trying one for a genus that rejoices in the sun, and includes in its ranks no single species of aquatic tendencies.

Except for a nip of frost in November, 1915, last winter proved as mild as any of the cycle of which—if we are to judge by our experience of the harsh weather of the past few weeks—it may turn out to be the last. Ushered in by the phenomenal rainfall with which 1916 ended, the beginning of 1916 was remarkable for the extraordinarily precocious condition of vegetation, and the little bulbous friends one begins to look for once the sun resumes his upward course were in much more of a hurry to show themselves twelve months ago than they have been of late.

Not only were Snowdrops, Aconites, and the other first-comers from three to four weeks ahead of the average timetable, but they remained in bloom far longer than usual, so that for the first time for many a year the Yellow Crocus and his reticulate were crowding on to the stage before the early-comers had done their turn. In every direction signs of quickening life came thick and fast, and staid old Elms that had seen a century go by were cozened into bloom before St. Hilary's Day. Even the birds

fell under the warm and wondrous spell, and, all preliminary pipings finished weeks before, thrush and blackbird hailed the New Year with full-throated song. Wiseacres wagged their heads and prophesied disaster, but, though the pace seemed too good to last, the first seven weeks passed without a trace of frost.

Then came a change, for, with a rainfall that has seldom been equalled in the third month during the past forty years, March mothered the damp and chilly air which was so insistent a feature of last year. As if that were not enough, the second half of the month saw the country treated to every sort and kind of noxious weather: snow, rain, hail, frost, and thaw followed each other with bewildering rapidity, the whole culminating on the 28th-29th in a blizzard that tore the face of the land to pieces and littered the countryside with fallen trees.

Up to about the beginning of the vernal equinox, Lilies shared in the general hurry-scurry and made unusually rapid progress; *L. Hansonii* outgrew all others, and was in such uncommon hurry that by March 25 scores of stems had overtopped the three-foot mark, and so completed more than half their upward growth. The fact that four days later, during the blizzard, every one of these Lilies was prone upon the ground, weighed down by snow and frozen where it lay, may seem to point the moral, but *L. Hansonii* is the hardiest of plants, and makes light even of treatment as rough as that.

For the rest of the season the record was a dismal one, brightened all too seldom, as at the end of May and the middle of July, by short bursts of summer. Even August failed us, and though September brought relief, of which, to be sure, *L. Henryi* took full advantage by flowering more bravely than the writer has known it flower before, the change came too late to save the situation.

Such seasons are a trial to the most philosophically minded grower of Lilies, but, even if skilled in all the arts and artifices of the cultivator, he finds himself and his treasures helpless when Providence casts a misty and persistent veil 'twixt sun and earth. But, after all, down and dripping summers are few and far between; they damp enthusiasm, no doubt, and are the undoing of the chicken-hearted gardener, but they have their uses, and it were churlish to complain.

It is pleasant to be able to record that nothing our climate can do seems sensibly to affect the stream of newcomers to the Lily world, and it rolls on in placid, if somewhat sluggish, fashion. Few are the years now that do not bring some new species or variety to light, help us to elucidate some doubtful point in nomenclature, or make us acquainted with some species that has hitherto been no more than a name, perhaps, or a number attached to a herbarium specimen, dried and difficult of identification or description to a degree that would cause even the spirit of Franchet to shudder.

To the first category belongs a little

Lily collected by Forrest in Western China, which has been wrongly identified as *L. apertum* var. *tibeticum* (Fr.). The bulbs, originally received from Prof. Bayley Balfour, as well as from Messrs. Bees, three years ago, began to bloom last last summer, and these, together with a specimen kindly sent by Messrs. Wallace, will, no doubt, provide ample material for critical examination and description during the coming season. Meanwhile, as the illustration (fig. 27) shows, the Lily is distinct in leaf and flower from any other known to cultivation. The bulb, too, of which, unfortunately, a photograph is not yet available, is unique in that the length is more than three times the diameter, the latter being about an inch; it is composed of a few long, fleshy, leaf-like scales loosely folded one on to the other, white in the lower part and tinged with purple at the apex. It approaches that of *L. polyphyllum* in general outline, though a good deal longer.

A consideration of this species, which falls into the *Notholirion* group, and of some other Chinese Lilies, renders it difficult to understand how the accepted technical distinction between Lilies and Fritillaries is to be maintained.

During the year it has been possible to set at rest all doubt as to the specific distinction between two Western Chinese Lilies, *L. Thayerae* and *Willmottiae*, concerning the relationship of which there has been a good deal of doubt since Wilson put them into Western hands some years ago.

Though there has never been any difficulty in distinguishing typical plants one from the other, a general and superficial family resemblance is probably responsible for the notion that the two plants are but forms of the same thing. If all else failed, however, it seems clear from an examination of the capsules, of which Mr. Malby has made such excellent photographs (fig. 28), that the two Lilies should be kept apart.

L. Thayerae originally came into cultivation from Messrs. Veitch's nursery as *L. sutchuenense* (Franchet), under which name it is grown at Kew, and it has always been a little difficult to understand how the robust and floriferous plants one may see in bloom at Kew ever came to be regarded as identical with Hooker's dwarf and lax-stemmed *L. sutchuenense* of the *Bot. Mag.*, t. 7715.

The identity of *L. Willmottiae* (Wilson) is even now not certain, and Wilson inclines to the view that it may be the true *L. sutchuenense* of Franchet, not to be confused with *L. sutchuenense* of the *Bot. Mag.* around which a fog of uncertainty and doubt has gathered. The point will doubtless be cleared up ere long, and, however that may be, there is no question but that *L. Willmottiae*, as we must continue to call it for the present, is a remarkably fine garden plant, distinct from any others of the pseudo-tigrinum section which have come under our notice up to the present.

Reference has already been made to *L.*

FIG. 27.—A NEW SPECIES OF LILIAM FROM WESTERN CHINA. PETALS WHITE, DOTTED WITH ROSE. ANTHERS YELLOW.

Henry, which quite outdid itself last year. Though one of the first of the Lilies to spear through the earth in spring, it is a great deal more leisurely about the business of life above ground than most, taking quite seven months to do it. It has, however, such a tough constitution, when soil and other factors are to its liking, as to be independent of climatic conditions that prove too much for many other species; indeed, it can be said with truth that not only did *L. Henryi* come through the ordeal of last season unscathed, but, while many other species were giving up the fight, it grew and grew till at last it was able to look over a wall 8 feet high; not satisfied with that, during a blistering fortnight in early September it burst into the mass of bloom portrayed in the photograph (fig. 29). So floriferous was it that numerous examples were to be seen carrying two flowers on a pedicel.

And this is the Lily Dr. Henry never saw more than 4 feet high, or bearing more than four flowers, on the limestone bluffs of Ichang.

The bulbs of these astonishing plants have been in the ground no more than five years, and are now little less than the span of a hand in diameter. They are in thin and hungry calcareous ground in which one would hesitate to plant anything except some of the Western Chinese Rhododendrons, which, as experience has shown, thrive in it.

Several correspondents have written about a form of *L. giganteum* that has cropped up here and there of late years, and is not identical with *L. giganteum* of gardens, a familiar friend and originally a plant of Nepal and the Himalaya.

The form in question has been dubbed *L. giganteum yunnanense*, apparently on the authority of Max Leichtlin, who distributed seed of it to a few correspondents in 1908; but, even if Leichtlin was responsible for the name, it is doubtful if at that time he could have been in a position to express a definite opinion as to the identity of the plant.

Moreover, in sending seed to the writer, he labelled it "*cardiocrinum* from Yunnan, possibly *cordifolium*." Leichtlin had a penchant for *L. cordifolium*, a species by no means always easy to come by, and seldom passed on seed he received from his missionary correspondents of the *cardiocrinum* section of *Lilium* without hazarding the suggestion that it might be *L. cordifolium*.

A general review of the Lily season is not the place for a critical exposition of any particular species, but one may perhaps be allowed to express the opinion that, on the evidence before us, the so-called *L. giganteum yunnanense* leans more to *L. cordifolium* than to *giganteum*. At any rate, the capsules of the two are very different (see figs. 30 and 31), and there is no difficulty in finding capsules of the newcomer from which the figure of that of *L. cordifolium* in the *Monograph of the Genus Lilium* might have been drawn.

Broadly speaking, and apart from the marked difference between the capsules of the two,

FIG. 28.—SEED CAPSULES. ABOVE, LILIAM THAYERAE. BELOW, L. WILLMOTIAE.

the form under notice may readily be distinguished from the Himalayan Lily by a comparative want of stature; it reaches to the shoulders only of the latter—a far more erect position of the flowers. For they are almost horizontal, and the fact that it comes into bloom about three weeks before the other. The paucity of foliage on the lower part of the stem is a marked characteristic of *L. cordifolium*, and this Lily of Leichtlin's shares the peculiarity.

Another noticeable feature of this stranger, as grown in Great Britain, is that the stems are very dark in colour, almost black, in fact, and while, to be sure, a specimen with more or less dark stem is to be found wherever *giganteum* congregates, it is the exception and not the rule.

Some day, perhaps, when the flora of the wild country that stretches for more than 600 miles east of Sikkim has been systematically investi-

gated, it may be possible to study step by step the changes that *local* and climatic conditions have imposed on *L. giganteum* on its way from India through the heart of China till it turns up in Japan, more than a couple of thousand miles away from the Eastern Himalaya, in the forms known to botanists as *L. cordifolium* and *L. Glehnii*.

During the year specimens were received from Messrs. Bees of what appeared to be *L. mirabile*, an addition to the small section of Lilies with heart-shaped leaves. According to Franchet, the distinguishing peculiarity of the species, and one on which he seems to have founded it, is the centrifugal habit of flowering. The single specimen the writer has had under observation undoubtedly possessed this peculiarity in a regular and marked degree, so much so in fact that the petals of the uppermost flowers had fallen before the lower had properly expanded. Messrs. Bees, too, who raised the Lily from seed sent home by Forrest, noticed the same character in the plants that flowered last year at Sealand. No definite conclusion, however, on a point of this kind can be arrived at from the examination of a few specimens, and time alone can show if this unusual habit is fixed.

In *A Naturalist in Western China*, Wilson refers to *L. mirabile* as common about Wapeng, on the Hupeh-Szechuan frontier, and tells the present writer that it is a distinct species. Comparison of the capsule of this Lily with that of *L. giganteum* seems to bear out this view.

L. Duchartrei has never been more than a bird of passage in this country, possibly because of the difficulty of obtaining bulbs of it, but, thanks to the good offices of Mr. Wilson, the species flowered in the writer's garden last summer, and, it is to be hoped, may come to maturity in due course and furnish that need of seed without which it is so difficult to raise Lilies from regions far away. *L. Duchartrei* is a most desirable Lily. *J. G. G. Kents, Hedley-on-Thames, Feb. 14.*

FIG. 29.—LILIAM HENRYI BEARING 55 FLOWERS AND DOUBLE-FLOWERED PEDICELS.

TREES AND SHRUBS.

BAMBOOS GROWN IN SHADE.

FAILING to come across anyone who had had any experience of Bamboo-growing in shade, and finding here conditions otherwise ideal, I determined to make the experiment, and it has been an unexpected success.

The collection is only a small one, comprising some seventeen species—and those mostly such as are common, and seen to advantage at Kew. The only uncommon ones are *Arundinaria Fortunei*, *Phyllostachys mitis*, *P. aristata*, and Messrs. V. N. Gauntlett's new *Arundinaria insignis*.

The Bamboos grow in a small valley or dell three hundred yards long by one hundred broad, sheltered from every breath of wind, but completely overshadowed by tall Beech trees so drawn that they have developed no branches. The soil is deep, black leaf-mould, watered by two small streams.

The entire collection has grown normally except *P. mitis* and *P. viridiglaucensens*. The former grows normally, but the culms fail to ripen, and are cut down by the first frost; the latter responds sensitively to shade conditions; in dense shade it refuses to send up any culms, in shade less dense it grows freely; in semi-shade, viz. at the north-end of the dell, where it gets sun for an hour a day at midsummer, it grows copiously. In the densest shade, where it is, in fact, almost dark in summer, *P. Quilloyi* grows splendidly and is 10 feet high. *A. Simoni* grows better in shade than in the sun. *P. japonica* and *P. aristata* have both put out fresh foliage right through the frost, which has reached 10° to 14° night after night.

The question arises as to how all these Bamboos ripen their last year's culms so as to be able to resist the frost. One answer is that perhaps they do not ripen them but that the overhanging trees keep the frost off. Only one last year's culm has been cut down, and that belonged to a plant of *P. fastosa*, the hardiest Bamboo there is; but it was not a fully developed culm; it had not developed its top leaf, which, I believe, not a true leaf. In the other cases, even in that of *A. insignis*, which has no overhead shelter, all the last year's culms had developed the terminal leaf, and with the exception of *P. mitis*, when they reach that terminal growth they seem quite hardy.

A. insignis is certainly the glory of all Bamboos. For the man in the street it might be described as a glorified *A. nitida*, but very glorified; it has three times the grace of *A. nitida*; it grows three times as fast, it is apparently hardy if sheltered from the least suspicion of wind, and its foliage is a most brilliant light green.

The many *Rhododendron* species now grown in the temperate house at Kew must be much hardier than supposed anyhow, if sheltered from wind; *R. arboreum*, *R. Camellia*, and even *R. grande*, *syn. argenteum*, have won all the first prizes lately. *Rosal Lovett, Media, Wambourne.*

VEGETABLES.

SEA KALE.

This useful and delicious vegetable should be grown by everyone possessing a kitchen garden, as it is one of the simplest crops to produce, and is available all a season when other vegetables are scarce. Its propagation is quite simple, as every small rootlet, if properly treated, will form eyes and produce crowns, during the spring and summer, suitable for forcing in winter.

The present is the best time to select the root cuttings from plants which are being lifted. The cuttings are made from the smaller roots, and should be from 4 to 6 inches long. Tie them in small bundles of from 15 to 25,

FIG. 30. SEED CAPSULE OF THE SO-CALLED LILIUM GIANTUM YUNNANENSE.

(See p. 82.)

place them in a box, well packed with fine soil, and start them in a cold frame, or a strong proof building.

After hardening them, plant them in April in well-prepared, heavily manured ground, at a distance of 1 foot 2 inches from row to row and 1 foot from plant to plant. Insert the roots with the use of a dibber, and make the soil about them very firm. Place a few fine cinder ashes round each plant.

Beyond reducing the number of growths to one, and leaving the surface frequently, no other attention is needed. Immediately the summer growth is completed, and the foliage dies down, the whole of the top should be lifted, trimming off and saving the rootlets for the following year's supply. These rootlets may be prepared and stored in a cool place, ready for starting in early spring. Store the crowns in ashes under a north wall, and introduce them to the forcing pit for blanching as required. See *Kale* p. 81.

FIG. 31. SEED CAPSULE OF LILIUM GIANTUM (OF GARDENS).

(See p. 82.)

is easily blanched in a cellar, or an outside building, if care is taken to exclude the light.

Those who possess a warm, dark building may easily obtain a supply of forced heads during the winter. Seeing that all hardy green vegetables have been injured by the severe frosts and cold winds, Sea Kale should prove of especial value this season.

EARLY POTATOS.

THERE is little doubt that a shortage of Potatos will occur before the end of the season, and every possible means should be taken to increase the supply.

Potatos can be grown in pots, pans or boxes of all sorts; indeed, almost any receptacle. They may be started into growth in any warm place, even if it is quite dark; but immediately young growth appears above the surface of the soil they should be brought to the light and gradually hardened. Later on they may be placed at the foot of the south side of a wall or building, protected when necessary from frost.

Ordinary garden soil, sand or leaf-mould can be utilised, and very little is required to start with, more being added later on to prevent the new young tubers from greening. There are other methods of production which can be adapted by most people who possess a certain amount of ground, although only a back yard. A temporary skeleton pit may be built, with rough boards, turfs, or by driving into the ground a double line of stakes 4 inches apart, and with a height above ground of 3 feet at the back and 2 feet 6 inches in front; filling in the space between the stakes with the kind of material most easy to obtain, such as long litter, old straw, rough hay, bracken, or the trimmings of evergreen shrubs and trees. Firmly put together, such skeleton pits will last many years.

Portable frames are invaluable for the purpose, and many which have previously been occupied with more ornamental subjects should now be utilised. Well-decayed leaf soil, where easily obtainable, should be used in preference to any other mould.

With regard to varieties, those should be grown which mature early and produce the least amount of haulm, such as Sharp's Victor, Express, Harbinger, and May Queen. Wherever possible, use groomed tubers, with stout green shoots of about 2 inches in length. *E. Beckitt.*

RUNNER BEANS.

To gain time Runner Beans may be sown about the middle of April in boxes filled with light soil and germinated and grown on in a cold frame. The seedlings will be ready for planting early in May, the actual date depending on the weather, as it is obviously unwise to plant when nights are frosty. The end of April is early enough to make a sowing out-of-doors unless the situation is exceptionally sheltered.

Overcrowding is responsible for many partial failures, and inevitably results in a smaller crop. For this reason single rows are desirable, and plants allowed a distance of 3 feet apart will soon fill their allotted space with luxuriant growth, bearing pods superior in quality to those produced in crowded rows. A single specimen planted in deeply cultivated, well-enriched soil will develop into a column of growth several feet in diameter.

The best distance apart for ordinary purposes is from 1½ to 2 feet, and the plants should be pinched when they have reached the top of the supports. If pods are required for exhibition retain only two of the straightest on each truss.

The pods are frequently allowed to remain on the plants too long; and apart from stringy pods of poor flavour being sent to table, the practice results in a permanent weakening of the crop. The plants will furnish many new pods of superior quality if they are gathered while quite young. If the pods are not urgently required the plants will gain strength if the first trusses of bloom are removed. *E. R. Jones.*

FRENCH NOTE.

M. OSCAR FANYAU.

ONE of the Paris daily papers, the *Parisien*, gave, on February 9, the following account of the tragic death of M. Oscar Fanyau, well known in the north of France for his love of horticulture, and whose glass-houses, particularly rich in rare Orchids, were famous throughout the countryside. The "Kommandantur" of Hellemmes seized M. Fanyau's house and grounds some time ago, leaving, with characteristic graciousness, the underground floor of the house in the occupation of the proprietor, his grandson and an old servant. M. Fanyau was seventy years of age. When copper was requisitioned at Hellemmes, he refused to make the prescribed declaration, and instead addressed the Commandant thus: "For two years you have occupied my house. You know its contents. If it pleases you to take away my copper ornaments and works of art I cannot prevent it; but expect from me no declaration, nor any obedience to a German command. I am an old officer of 1870, and I refuse to betray my country by giving over to the enemy material for the manufacture of shells to kill my countrymen." For having thus "resisted" authority, he was imprisoned at Loos, to await deportation to Germany. On the following day he was found dead in his cell, and only after much supplication was his grandchild allowed to make the necessary funeral arrangements. M. Fanyau's services to horticulture were great; among the best of his Orchids were *Odontoglossum Rosati*, *O. Alexandrine*, *Triumphant d'Hellemmes*, and *Odontodia Cleverlyannii*. At the last Horticultural Exhibition held in Lille, in June, 1914, the Grand Prix d'Honneur, a gold medal offered by the King of the Belgians, was awarded to M. Fanyau for his exhibit of Orchids and greenhouse plants. J. M.

PLANT NOTES.

BURCHELLIA CAPENSIS.

THIS thoroughly good old-fashioned plant is much less frequently met with than was at one time the case. Its usual season of blooming is in the spring months, at which period it forms a bright and attractive feature in the warm greenhouse. This *Burchellia*, which is a native of South Africa, is a freely-branched, sturdy shrub, clothed with ovate, oppositely-arranged leaves, about 4 inches long, and of a deep green tint. The flowers, which are borne in clusters on the points of the preceding year's shoots, are tubular, a little over an inch long, and of a deep orange-scarlet colour. This tint is particularly effective against the dark green background of foliage. The cultural requirements of this *Burchellia* are not great. It responds to a little more heat better than many other natives of South Africa, and succeeds in a warm greenhouse or intermediate temperature. Some grow it as a stove plant, but this extra heat is not needed. In the stove the leaves are somewhat liable to be attacked by thrips—practically the only insect pests to give any trouble. Cuttings of the half-ripened shoots strike root without difficulty if put into well-drained pots of sandy soil and placed in a close propagating-case in a warm house. If the cuttings have a little bottom heat so much the better. The young plants should be stopped once or twice during their earlier stages, in order to ensure a bushy habit. A suitable compost for established specimens may be made up of two parts loam to one part peat, and a good sprinkling of silver sand. It is a member of the Rubiaceae, which contains many beautiful flowering plants, such as the different members of the genus *Boerhaavia*, *Gardenia*, *Lyonia*, *Mazetta*, *Rondeletia*, and others, as well as many of great economic value. W. T.

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor.

TURNSIPS IN PITS.—Make a sowing of Early White Milan Turnip in a cool pit at once. Rich soil is necessary for this crop, and should be placed to within 18 inches of the roof-glass. Sow the seeds thinly, and keep the pit closed until the seedlings are well through the surface, after which admit air in sufficient quantity to keep them from becoming drawn. Thin the seedlings as soon as they are ready for the operation, and give the crop liberal supplies of water to promote a quick growth.

BEET.—Sow a few seeds of Early Globe Beet in a slightly heated pit, or in a cold pit where frost can be excluded by a covering of mats or long litter. Use light, rich soil, and sow the seeds in shallow drills. Thin the seedlings to 9 inches apart as soon as they are large enough for handling. Water the seed bed liberally with soft water, and keep a sharp watch for slugs.

CARROTS.—Carrots should be sown in cold pits to provide roots for a succession. Make the soil as fine as possible, and raise the bed to within 15 inches of the roof-glass. Sow the seeds thinly, covering them lightly with fine, sifted soil. Damp the surface of the bed on sunny days with clear water. Carrots raised from seed sown early in January are well through the surface, and will require careful ventilation. As soon as the plants are large enough they should be thinned, and the bed watered with clean, soft water. If slugs are troublesome, dust the edges of the bed with soot or lime.

POTATOS.—All available pits should be planted with Potatos as soon as possible. A good depth of soil should be provided, and, if available, a quantity of manure from a spent Mushroom bed incorporated with it. Allow plenty of space between the sets for the full development of the plants, 2 feet between the rows and at least 1 foot between the plants in the row if necessary. Cover the seed tubers with loose soil, and earth up the plants when the haulm is 6 inches high. Give the roots a plentiful supply of water as growth advances. Admit air freely in order to promote stocky growth. May Queen, Early Paritum, Duke of York, and Sharpe's Express are good varieties for growing in pits as well as in early borders.

BRUSSELS SPROUTS.—The main sowing of Brussels Sprouts may be made forthwith. As Frenchie we sow this batch in a cold frame, and transplant the seedlings in a sheltered border as soon as they are large enough for transfer. By this means we secure a sufficient number of stocky plants to form the principal plantation. A later sowing may be made in the open for late supplies. The bed for this crop should be prepared thoroughly, and plenty of space allowed between the plants. Those transplanted in strong soil should be allowed a space of 3 feet between the rows and 2½ feet between the plants in the row. Ideal, Dwarf Gem, and Darlington are reliable varieties.

CAULIFLOWERS.—A sowing of a main crop variety of Cauliflowers may also be made now in order to produce heads for use in August and September. Early London, Walleheren, and Early Autumn Giant are suitable for the purpose, as they will be fit for use after the earliest plantations are over. Ventilate Cauliflower plants in pots which have been wintered in cold pits freely, in order to keep the plants stocky, and never allow them to suffer from want of water at the roots. If pots and space are available, some of the more forward plants may be potted into large pots with a view to producing early heads. Pot the plants in rich soil, and always keep the roots moist. If the stock of plants include the varieties Magnum Bonum or Great Dane, they will answer this purpose better than the small, early varieties, as the heads are larger and of better quality.

MINT, TARRAGON, AND OTHER HERBS.—A supply of Green Mint and Tarragon may be produced easily now by placing a suitable number of roots over a mild hotbed and covering them with fine leaf-mould. Chervil seed should be sown thinly in a cold frame; cover the seeds lightly with fine soil, and keep the frame closed until the crop is well through the surface. Make frequent small sowings of this herb. Chives may be lifted from the garden and treated in the same manner; the plants will soon make luxuriant growth, and will be useful for shading during the spring.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COXMAN, Bart., Gattin Park, Reigate.

THE COOL HOUSE.—The majority of plants in the cool Orchid house, including *Odontoglossum crispum*, *O. Pescatorei*, and their many hybrids, and *Odontiodas*, are in vigorous growth, and many have nearly completed the development of their new pseudo-bulbs. The greatest care should be exercised to have the pseudo-bulbs well matured. The plants should receive the fullest possible exposure to light, short of subjecting them to injury by scorching. As the flower-spikes develop, care should be taken that they are not injured by slugs. As soon as the inflorescences are a few inches long it is a good plan to wrap a piece of wadding around the base of the leaf that shields the spike; while moderately dry this will prevent the slugs from creeping up from the surface of the compost. Slugs may be trapped by placing damp bean or lettuce leaves on the stages near the plants, searching for them at night and early morning. When the flower-spikes have attained a sufficient length they should be tied to neat sticks and placed facing the light in such a position as to cause them to grow in a graceful, arching shape, which greatly adds to their beauty. Plants of *Odontoglossum octosumum* have commenced to develop young growths from the base of the new pseudo-bulbs, but they should still be kept dry at the roots, and the treatment continued until the flower-spikes make their appearance from the centre of the young growths, when the compost should be watered copiously, and the plants placed in the warmer part of the house. *O. grande* and *O. Trichocarpidium* should still be kept dry, and require but very little water at the roots until growth again becomes active. If these plants are not afforded a long season of rest they will not flower satisfactorily.

ONCIDIUM.—Winter-flowering *Oncidium*s, such as *O. monchii*, *O. Foulieii*, and *O. varicosum*, are passing out of flower, and should be afforded only sufficient water at the roots to prevent the pseudo-bulbs from shrivelling. The plants will soon begin to grow afresh, and any that require fresh rooting material may be attended to as soon as young roots push from the base of the new growths. These plants are best grown in shallow pans suspended from the roof rafters, in a house having a temperature ranging from 55° to 62°, allowing the temperature to rise as the season advances. The pans should be only just large enough to accommodate the plants, as they grow best when the roots are in a restricted space. In potting, press the compost moderately firmly between the roots, placing the base of the young shoot well down into the soil. This method minimises the danger of damage by slugs, which are particularly fond of the roots of *Oncidium*s. A suitable rooting medium for these plants consists of a mixture of 11 fibre, half decayed Oak-leaves, rubbed through a 3-inch sieve, and chopped Sphagnum-moss in equal proportions, adding crushed crocks to keep the compost porous. *O. Parilloi*, *O. flexuosum*, *O. Kramerianum*, and *O. Cavendishianum* require a higher temperature than those mentioned.

COELOGYNE CRISTATA.—Plants of *Coelogyne cristata* are developing flower-spikes, and should be afforded sufficient water at the roots to keep the pseudo-bulbs plump, or the flowers will grow weak. Do not syringe the plants overhead, for it might cause the flower-spikes to decay.

THE FLOWER GARDEN.

By W. J. GIBSE, Gardener to Mrs. DEMPSTER Keele Hall, Staffordshire.

ANEMONE AND RANUNCULUS.—Anemones should be planted directly in the ground in a friable condition. The soil for these plants should be well prepared, and of a rich, moist nature. The St. Bridget and fulgens types are commonly cultivated. The Bride (white), His Excellency (scarlet), and Blue Gown (pale blue), are other fine Anemones which may be raised from seed sown now, in boxes, or in a cool frame. Fire must not be employed at any stage. Ranunculus do much better planted now than in the autumn. Plant the roots 2 inches deep and 6 inches apart in well-prepared, rich loam. Place the claws downwards and cover the whole with fine soil. During dry weather liberal supplies of water must be given. Directly the foliage is dead lift the root tubers and store them in a cool shed.

MONTBRETIA.—Plants of Montbretia that were lifted in the autumn should be re-planted as soon as possible. Select the best corms, planting the smaller ones in open spaces in shrubberies. Montbretias thrive exceedingly well in old potting soil enriched with a liberal amount of leaf-mould and a little sand. Britannia (scarlet), Etoile de Feu (vermillion), Rosa (rose), Rayon d'Or (yellow), and St. Botolph (yellow), are all excellent varieties.

HARDY ANNUALS.—Autumn-sown annuals and biennials should receive attention occasionally. Take the first opportunity in favourable weather to run the hoe between the plants. The work of transplanting or removing them to their flowering quarters should be done during mild weather.

VERBENA. If not already done, Verbena seed should be sown forthwith. It is hardly worth the trouble to propagate Verbenas from cuttings as seedlings are generally much stronger, and give a wide range of colours. Sow thinly in pans or boxes filled with a rich compost; cover the seeds lightly with fine sandy soil, and germinate them in a temperature of 55°. Transfer the seedlings to small pots when they are large enough to handle, shifting them into pots a size larger as this becomes necessary. Remove the plants to cooler quarters gradually, but on no account should growth be hurried by too much warmth.

DELPHINIUM.—Seedling Delphiniums are often very disappointing, the colours generally being very poor; to ensure success the seed should be from a specially good strain. For decorative or bedding purposes there are few annuals to equal the Delphinium, and certainly none that gives a more charming effect for so small an amount of labour. Sow the seed thinly in pans or boxes, filled with a compost consisting of loam, leaf-mould, sand, and a little decayed manure. A temperature of 50° to 55° is sufficient to germinate the seed. Directly the seedlings are large enough, prick them out into cold frames at 4 inches apart. The tall varieties are suitable for planting in mixed borders and shrubberies, and the dwarf varieties for small beds. Last year the seedlings were planted in their flowering quarters direct from the seed boxes with excellent results.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVEY, Abbotts Wood, Godalming, Surrey.

PEACHES AND NECTARINES ON WALLS.—After the trees have been nailed to the wall for a number of years the bricks may need re-pointing to fill up the numerous holes that the nails have made. The nail-holes offer lurking places to insect pests. Get some good fresh lime, and slack sufficient to fill a good-sized pail, and add to each pail of lime 1 lb. of sulphur, 1 lb. of soft soap, 1 lb. of soot, 1 quart of paraffin or petroleum, and thoroughly mix the ingredients into a fairly thick paste. Enfasten the branches, tie them in bundles and sling them up with a string out of the way of the workman. Push the lime material into the wall by means of a stiff brush, filling up every crevice. The petroleum makes the material cling to the wall and also has a good effect on the early and critical stages of the young growths.

PRUNING AND TRAINING.—Assuming that the trees were carefully disbudded, but very little pruning is necessary beyond shortening some of the longer branches and the weak wood to perhaps a couple of eyes, for growth from these buds may be necessary to fill a bare space. At the same time as much of the old wood as can conveniently be spared should be taken away, as both the Peach and Nectarine fruit on the wood of the previous season. Nail or tie up the centre-branch perfectly straight, using soft tarred string, then tie the branches left and right at the bottom in a horizontal manner. Regulate the main branches at different angles and let the others radiate from these to fill up blank spaces. The shoots should be trained about 6 inches apart until a perfect fan shape is made. Twisted raffia is strong enough for securing the smaller branches. The branches of smaller maiden, newly-planted trees should be shortened considerably if a perfect specimen is to be formed. Strong shoots must be checked or the bottom of the tree will never become furnished with suitable growth. Material for protecting the blossoms should be got in readiness. If blimps are used, these should be adjusted so that they can be easily manipulated, and need only pulling down at night when the trees are in flower. The trees are backward this season, but with increased sunshine they may be expected to develop very rapidly. The borders should be made tidy and afterwards top-dressed, taking care to make the ground firm.

GENERAL REMARKS.—The pruning of all kinds of fruit trees should be pushed forward and the work finished as soon as possible. Owing to stress of weather much work is in arrears, but with extra energy delays may be caught up. Prunings required as grafts later should be sheltered a few inches in the soil, in a cold, sheltered spot.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHCOTE, Eastwell Park, Kent.

CALCEOLARIA CLIBRANI.—Young plants of Calceolaria Clibrani propagated last autumn and winter in 60-sized pots should be placed in their flowering pots, either 48's or 32's being suitable for the first year. Two and three year old plants that flowered last May, cut down at the roots and placed in a cold frame, will make splendid specimens. Having been afforded a liberal shift in the autumn in a fairly rich compost, they may be expected to do well. This Calceolaria is very impatient of dry fire-heat, and will not even tolerate being placed on a dry stage. It thrives best in a cool house or pit, on a damp bottom, with foliage close to the roof-glass. A minimum temperature of 40° is suitable in winter, and the house should be ventilated in favourable weather. When the plants commence to grow in the spring, give the roots a little rich top-dressing, and secure the shoots to neat green bamboo "points." For large specimens 2½ to 3 feet long will be necessary, tying the flower-pikes as they elongate. When in full growth the roots must never be allowed to suffer for want of moisture, or growth will be stunted. The atmosphere should be kept moist until the plants are commencing to flower. Let the plants have plenty of space, to keep the lower leaves perfectly healthy.

RICHARDIA ELIOTIANA.—After a period of rest these plants should be shaken out, potted into new soil, and placed in a warm house to start into growth. The yellow spathe and hand-some flowers are very effective, and a few plants should always be found in a good collection of flowering plants.

EUPHORBIA PULCHERRIMA.—The foliage of Poinsettias, as these plants are usually termed in gardens, having turned yellow, the plants should be given a complete rest in a cool house. Keep the roots quite dry for the next month or two. If there is a danger of moisture from "drip," place the pots on their sides until it is required to start the plants into growth again.

EUPHORBIA JACQUINIAEFLORA.—As plants of this Euphorbia pass out of bloom they should be

kept considerably drier at the roots, but not to such a degree as in the case of Poinsettias. Stand the plants in a light house, and do not allow the temperature to fall below 55°, or many losses will occur. When the foliage has ripened, cut the tops down to firm wood, and, as the days lengthen, spray them occasionally to encourage the development of shoots for cuttings.

COLEUS.—Cuttings of Coleus will root readily now in the propagating house. When rooted, they should be removed from the frame, and gradually exposed to full sunshine. They should then be potted into 60-sized pots, using a light, sandy soil for the first potting. Return them to a shelf in a hot house, and, after shading them for a day or two, place them in full exposure to the sun, with plenty of atmospheric moisture. Plants intended to be grown as large specimens should never be allowed to become rootbound, but should be shifted into larger pots by stages. Use a rougher and richer compost for these plants. When they have been in large pots for some time, the roots need regular and constant feeding to keep the plants in good health. Pinch the points of the shoots at all stages of the plants' development before they grow too long. This is necessary to lay a good foundation for a well-grown plant.

FRUITS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton, W.

PEACHES AND NECTARINES IN BORDERS.—There is but little gain in the fruits of trained Peaches and Nectarines setting very early, and the risk exceeds the advantage. During the past month there has been an almost continuous frost, and experienced growers will realise that where much fire heat is required greatly puts in an appearance early. It will be necessary to keep a sharp watch for this troublesome insect when the earliest leaves are unfolding. If, however, the house was fumigated just before the flowers opened, aphid should not cause much trouble. Do not wait until the presence of the pest is detected, but rather anticipate it and take precautionary measures in good time. Trained trees near the roof-glass are much better, on the whole, for early crops than those trained against back walls, and, where there is space to pass between the front trellis and the lights, this permits of an easier manipulation of the trees. Those who still depend on a rabbit's tail or camel's hair brush for pollinating the flowers are thus enabled to get at the blooms easily. The atmosphere should be dry during the flowering period; we damp the bare spaces as usual, but discontinue overhead syringings. During this period a little ventilation may be permitted almost continuously, except when cold east winds prevail, it being only necessary at such times to open the ventilators a little when the sun is shining. With regard to temperature, 50° to 55° at night when the trees are in flower is suitable; this allows of a 15° fall by the morning, and a rise of 10° to 15° in the day may be permitted. Increase the heat in the pipes at day-break, but slow down the fires as soon as this has been attained. I damp down at nightfall with the pipes fairly warm. It is not advisable to hasten the development of trees in later houses. The object now is to save all the firing possible whenever and wherever it can be done. If the trees are on the move, keep the houses cool for another week or two, with a night temperature of 40°.

PEACHES AND NECTARINES IN POTS.—We rely on pot trees for our earliest crops of these fruits, and they almost invariably succeed. Our earliest trees are just about to flower, and in another week's time a hive of bees will be introduced into the house. Our earliest Nectarine is Cardinal, and I do not know of a better early sort. Our earliest Peaches are Duchess of Cornwall and Duke of York. Plum trees in the same house are starting into growth, and will be in flower a few days later. Very close attention should be paid to watering the roots.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would oblige by obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITOR. The same departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intimation of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication.—As well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If illustrations are sent, they will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, FEBRUARY 27.—

Royal Horticultural Society, Exhibition of Flowers Plants, Ac., 1-5, Lecture at 3 by Mr. John Dickson on Hardy Plants for the Flower Garden.—London Scottish Drill Hall, Buckingham Gate, 10.00. Bot. Club's annual meeting, dinner and lecture.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 40.2°.

ACTUAL TEMPERATURE.—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, February 22 (10.0 a.m.): Bar, 30.25°; temp., 41.5°; Weather, Cloudy.

SALES FOR THE ENSUING WEEK.

WEDNESDAY

Herbaceous and Rock Plants, Fruit Trees, Rhododendrons, Lilies, Eucharis amazonica, at 67 and 68 Chapsade, by Protheroe and Morris, at 12 and 3 o'clock.

THURSDAY

Standard, Dwarf, and Climbing Roses, at 67 and 68 Chapsade, by Protheroe and Morris, at 1 o'clock.

FRIDAY AND SATURDAY

Sale of Nursery Stock at Willow Grove Nursery, Chesham, by Protheroe and Morris, at 11.30 o'clock.

FRIDAY

Fruit Trees, Roses, Rhododendrons, Herbaceous Plants, at 12 o'clock, Orchids in variety at 1 o'clock, at 67 and 68 Chapsade, by Protheroe and Morris.

or fatty foods are required, the former to repair waste of muscle, and the latter to produce heat and to provide energy for work. Another way in which food values may be estimated is in food-units or calories, which indicate the amount of available energy contained in food.

If it may be assumed that the average man is fed on a mixed diet, and that this mixed diet supplies sufficient protein to repair the tissues and make good waste, the value of any vegetable constituent of the food may be estimated by the latter method—that is, by determining the number of food-units (calories) in a given weight of the foodstuff.

Looked at from this standpoint, it ought to be fairly easy to state which vegetables are the best; but to do this, another factor must be taken into consideration—namely, the yield of each crop per unit of area. Unless this is done, altogether wrong conclusions are bound to be drawn. For instance, it has been stated recently that the food-value of Parsnips is three-quarters that of Potatoes. This is true in the sense that the food-units (calories) in a pound of Parsnips are about three-quarters of those in a pound of Potatoes. When, however, we ask the essential questions, how many calories are produced by a rod of ground under Potatoes, and how does this number compare with that provided by an equal area of ground under Parsnips, we shall discover that, owing to their higher yield, the number of calories (food-units) produced by Potatoes per unit of area is considerably more than a quarter as much again as the number yielded by Parsnips. Another consideration which has hitherto escaped the notice of the chemical analysts of foodstuffs is that different varieties of the same vegetable differ widely in feeding value.

It is much to be desired that this interesting aspect of the food question should receive more attention than it has yet had, and we hope that it will be possible for the Research Station at Wisley, which, as we understand, is engaged in this subject, to investigate thoroughly and systematically the relative food value of different varieties of vegetables.

In the meantime, it may be stated with confidence that of all crops grown in gardens the Potato gives the largest return as measured in calories per unit of area. Next and almost equal to the Potato comes the Beet; well below these is the Jerusalem Artichoke; and below the Artichoke the Parsnip and autumn Cabbage. Among the lowest are garden Peas. So that, when intensive cultivators are urged to grow Peas, they are being told to grow what, in fact, is a luxury crop. It is true that it contains per pound of dry weight far more protein than is contained in an equal weight of Potatoes, but when the relatively low yield of Peas is taken into consideration, the far greater value of the Potato becomes apparent.

Whether Haricot Beans would be a profitable crop from this point of view we have not the data to determine. It is probable that it would; but in the meantime it is evident that the Potato should

occupy in these times a large space in any scheme of cropping, and that garden Peas and Brussels Sprouts, which give a low yield per acre, should be grown only on a restricted scale.

There are, of course, other factors to be taken into consideration in estimating the food values of vegetables. One of these is the richness of vegetables in what are known as accessory food bodies—bodies the special function of which is to stimulate and regulate growth.

The relative values of different vegetables from this point of view have not been determined, but it is probable that the instinct which leads men to eat vegetables so relatively low in the scale of food values as Onions, Carrots, and Tomatos indicates that these vegetables are rich in the essential accessory food substances.

BOARD OF AGRICULTURE APPOINTMENTS.—

The Hon. E. G. STURT and Mr. A. D. HALL have accepted, for the period of the war, the unpaid posts under the Board of Agriculture and Fisheries of Additional Agricultural Adviser and Scientific and Technical Expert respectively. The Duke of MARLBOROUGH has been appointed Joint Parliamentary Secretary (unpaid) to the Board of Agriculture and Fisheries, and will represent that Department in the House of Lords.

THE NEW YEAR HONOURS.—

In addition to the recognitions recorded last week the Honours List contains the announcement that a knighthood has been bestowed on Dr. JAGADISH CHANDRA BOSE in recognition of his contributions to botanical physiology. Dr. Bose has for many years devoted his remarkable abilities to the investigation of plant-sensitiveness, and even those who are not able to agree with the conclusions which he has reached admire and appreciate the wonderful skill of experimentation which he has shown in his researches. Dr. Bose has, moreover, demonstrated his devotion to science by founding at Calcutta a Research Institute for Indian post-graduate students engaged in physiological and medical investigations. We congratulate the Colonial and Indian Departments of State on setting so good an example to the home departments.

AGRICULTURAL ORGANISATION IN FRANCE.—

Alphonse CLEMENTEL, the new French Minister of Agriculture, is making vigorous efforts to organise agricultural labour in preparation for the spring. To this end arrangements are being concluded with General LYAUTEY, the War Minister, to release certain classes of soldiers for work on the land, where possible at their own homes. Arrangements are being made for general Government direction of all agricultural labour, military or civilian. To this end a new Minister has been appointed, to be known as the Director-General of Agriculture, in the person of Monsieur FERNAND DAVID, Deputy for the Haute-Savoie, who was formerly Minister of Agriculture. Monsieur LE RORZIC, Deputy for Morbihan, is in charge of the work of increasing the production of Potatoes.

N.E. RAILWAY LINE-SIDE GARDENS.—

The N.E. Railway is acting with great energy in providing line-side gardens. No rent is charged except in the case of fenced allotments, and from the published list* it appears that nearly all the sites have been taken. Seed Potatoes Arran Chief and King Edward are being supplied at 15s. per cwt.

POTATO PRICES.—The revised maximum prices for the sale of Potatoes will be given in an

* N.E. Railway Magazine, Feb., 1917.

The Relative Food Values of Different Vegetable Crops.

At the present time, when so many people are undertaking the cultivation of vegetables, and even more are offering advice on the subject, it is important that the public should understand the relative food values of the chief garden crops. At first sight it would seem an easy matter to make precise and definite statements on this subject, for the crops have been analysed chemically many times, and the amounts of the several food constituents—proteins, sugars, starch, and oil—are known.

There are, however, two ways of estimating food values. One way is to determine how much protein and how much carbohydrate (starch or sugar) or fat are required by the average man or woman. Both protein and carbohydrate

order to be issued forthwith. The revised prices of reliance may be placed on reports, will enable grower, dealer, and retailer to carry on their businesses without one or the other incurring loss.

STATE ASSISTANCE TO HORTICULTURE AND FORESTRY IN HONG KONG.—The *South China Morning Post*, a daily paper published in English at Hong Kong, publishes in full the budget of the Colony, which includes small sums provided under the heading of "special expenditure" for clearing brushwood at Mount Kailash, and for laying out the grounds of the Ellis Kadoorie School for Indians. This constitutes an increase of nearly \$3,000 in this department. Special attention was drawn in the report to the efficiency with which Mr. TROOPER and his staff carried out their duties.

ALLOTMENTS IN SCOTLAND. The demand for and provision of garden allotments in Scotland is growing rapidly, and there can be no doubt that in the future the garden allotment will form a great feature in the life of communities for the town artisan and those employed in shops and offices. The provision of allotments by the municipality of Glasgow, begun last year at Tollcross, has extended with the most encouraging results. Plots have been secured in different parts of the city, and a comprehensive system established under the charge of Mr. JAMES WILTON, the Superintendent of the Parks Department. The movement in Edinburgh is ably supported by the Town Council and their Superintendent of Parks, Mr. J. W. McHARTIE, who has done much to further the scheme. It is expected that 3,000 allotments will be in cultivation in the city of Edinburgh this year. Hamilton Town Council has applications for 700 allotments, and additional applications are being received.

POTATOS AND DISEASE. It is often supposed that disease of cultivated crops is a penalty which has to be paid for high cultivation. In the case of the Potato the statement is not infrequently met with that disease is due either to varieties running out or to heavy manuring. Without a doubt, any condition which is unfavourable to the plant itself is likely to render it a more ready prey to disease. But the experiments recently carried out by Mr. O. A. FRANK in planting clean seed in new land in South Dakota indicate that even when tubers free from disease are planted in land which has never carried a crop of Potatoes, disease makes its appearance. In order to make as sure as possible that the tubers used as "seed" were free from disease, they were cut and disinfected by treatment for 1½ hour with a solution of corrosive sublimate. Notwithstanding these precautions, the crop was by no means free from disease, and although it may be admitted that even with the most careful selection and disinfection the seed may still have harboured germs of disease, we think that the conclusion reached by the author is correct, and that disease which attacks the Potato, like misery, "doth walk about the orb of the world; like the sun it shines everywhere." No less interesting is the further conclusion reached in the course of these investigations that other crops, Lucerne and grain, appear to clean the land for less disease of Potatoes was noticed on land so cultivated than on a new virgin or desert land. The test would have been more conclusive, however, if Potato seed taken from a seed ball and raised in sterilised soil had been planted out on the virgin ground.

MECHANICAL AID TO LAND CULTIVATION. A correspondent emphasises the need for a small motor cultivation, on the lines suggested by *Southern Grower* and others in these pages, as a means of cultivating ground for vegetable crops.

ing, and especially in large gardens dotted with fruit trees. He encloses a cutting from *The Scotsman*, in which a correspondent suggests a motor plough two and a half or three feet long, with a plough and steering gear at either end. Such a plough would not require to be turned on reaching the end of its journey, it being simply necessary to reverse the gear on the backward journey.

HYBRID CYPRIPEDIUMS.—In addition to the Orchids mentioned in these pages last week as shown at the R.H.S. meeting, Messrs. HISSMAT AND CO., Southgate, staged a selection of hybrid Cypripediums, including several varieties of them

risk Potatoes in prices so reduced as to afford 20 at retail to the ordinary consumer.

BELGIAN GARDENING AT LETCHWORTH.—Soon after the outbreak of the war a number of Belgians, amongst whom were many discharged soldiers, settled at Letchworth, to be employed at the munition factory established by their countrymen, Messrs. KRAY and LAMY. Including women and children, several thousand Belgians are now living in the Garden City. In order to increase the food production and to improve the conditions in which these munition workers are living, the Belgian Minister of Agriculture

FIG. 52. ANISOMALI VERTICILLATA. A NEW PLANT FROM THE HIMALAYA (See p. 380.)

and C. Corona (Heatrice) and C. Schulz, with C. Alexandri and other Cymbidiums, and a bright form of *Sephiro Cattleya* Swa.

THE POTATO IN 1800. The curious may find in London's *Bell of Fame* a compilation recording the names of those who have received the Freedom of the City, the following entry:—"1800 No. 4. Revoked at the Court of Common Council that the Freedom of the City be given to Mr. WILLIAM ADAMS [the Adams were always agricultural!] in testimony of the high sense the Court entertains of the services he has rendered the public by vending upon his own account, and

has appointed a qualified horticulturist who will act as an instructor for the cultivation of their gardens. The directors of the metal works have taken this instructor in their employ, and one of them, M. LAMY, is to be the honorary president of a gardeners' association. Lectures are organised, and demonstrations on gardening given; seeds will be bought cooperatively, and plants for distribution raised in a central garden. Funds are supplied by the firm and by the Belgian Board of Agriculture.

PARIS SPRING SHOW.—The Council of the Société Nationale d'Horticulture de France has

* *Journal of Agric. Research*, U.S.A. Dept. of Agric., July 10, 1916.

Photograph by C. P. Roffel.

decided to hold a Spring Exhibition, the proceeds to be devoted to war charities. The exhibition will take place at the Society's head quarters, rue de Grenelle, from June 1 to 5. No money prizes will be paid to exhibitors.

THE FLORA OF THE NEW NOTES.—“Full many a flower is born to blush unseen” in the new paper money which is just issued. The Rose and the Thistle, the Shamrock and the Daffodil may all be discovered there. The earthly appearance of St. George and the Dragon suggests as a motto for the note:

“Dost thou think it a vain thing
That Georges' crowned for vanquishing
Should bear some dust from out the ring?”

ARTIFICIAL MANURES.—In view of the scarcity of artificial manures, the attention of growers is directed by the Board of Agriculture to the advantages of applying small quantities of lime in localities in which it can readily be obtained. Lime is itself an essential plant food; it will also unlock some of the stores of nitrogen and potash in the soil, especially heavy soils, and, as a temporary measure, may therefore take the place of part of the manures which the land would otherwise require. The Board also advises, in view of the difficulty of securing delivery of basic slag, superphosphate and other phosphatic manures, the withholding of phosphates from meadows and pastures during the remainder of the present season. All available supplies should be reserved for other crops, especially for roots and Potatoes. Having regard to the short supplies, it is not advisable to apply more than three-quarters of the usual dressings of these phosphatic manures, since better results may be expected from the same total weight of manure if the whole area under any particular crop is manured lightly, than if a part is heavily dressed and the balance left without artificial manure.

THE LOCAL SOCIETIES.—A Parish War Society has been formed at Wendy, Hertfordshire, its objects being to promote the production of more food, the profitable sale of members' produce, the purchase of their requirements, the provision of cheaper credit for productive purposes, the welfare of those who are now with the Colours or have been discharged from service, and to encourage thrift and saving.

—The Norfolk and Norwich Horticultural Society has inaugurated a League, to be known as the Norwich Food Production League, for the purpose of encouraging the growing of Potatoes and other vegetables. It comprises some 500 members, all of whom are engaged in cultivating allotments around Norwich. It is expected that the League will shortly become self-supporting.

ANEMONE VITIFOLIA.

This Himalayan plant (see fig. 32) in many respects resembles the well-known Japanese Anemone (*A. japonica*). The woolly foliage, however, is thicker, larger in size, and less divided, having more of the appearance of Vine leaves, from which resemblance it obtains its specific name. The flowers are of good substance, large size, pure white, and are very freely produced during the summer months. It is a handsome plant, but appears to be less hardy than its Japanese relative, although it will survive our hardest winters in sheltered situations. This fact may account for its rarity in gardens, although it has been in cultivation for nearly a century. The plant illustrated is growing in an open border, in light, sandy soil, and has been there for several years. It is a native of the Eastern Himalaya, including Bhotan, where it has recently been found by Mr. Cooper when collecting for Messrs. Bees, Ltd. W. L.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PROTECTION OF SEEDS.—Seeds will shortly be sown in various out-of-the-way places, and will be much exposed to the ravages of small birds and mice. To prevent these pests from destroying the crop the seeds should be dressed with paraffin and red lead. But just the amount of seeds required for sowing into a flower saucer and wet them with sufficient paraffin to make the seeds clog together, add sufficient red lead to part the seeds again and then shake them well up. All Brassica seeds—these, of course, include Turnips—also Peas, Radish and all hard shelled seeds, may be dressed. The paraffin does not make any difference to the germinating of the seeds. Soot or lime may be used instead of lead, but they do not stick so well to the seeds in wet weather. Unfortunately, this dressing will not prevent the Brassica species from clubbing as I once saw stated, *Thos. B. Archer, The Hazels Gardens, Princes, Lanes.*

POTTING PALMS.—Referring to the note by W. T., on page 76, on the above subject, I was interested in the details of the special pot he designed for Palms, but getting special pots made for a limited number of Palms might not be practicable in many cases. I quite appreciate the difficulty of keeping large specimen Palms for a number of years in moderate-sized pots, and in the Calendar notes on page 60 I omitted to mention that I have for some years used collars of zinc sheeting to avoid such large shifts. As the roots fill the pot and render the important matter of sufficient water somewhat difficult, a strip of zinc is neatly fitted round the top of the pot, cutting it sufficiently deep to press in the soil inside the rim of the pot. This will allow ample room for plenty of water and regular top-dressings to be given, and the plants can be kept in the same-sized pot for another year or two. Any one using large Palms for decoration will appreciate the advantage of keeping such plants in receptacles of moderate size: Oak tubs (made on the same principle as W. T.'s special pots) I have used for some years, and consider them quite suitable for specimen Palms, as being much handier for moving about. W. T.'s mention of the roots of the stronger growing Palms lifting the plants out of the pots, recalled to my mind that the grower of some of the finest Palms I have ever seen told me that he prevented this by ramming the soil, when potting Palms, as hard as he would for a specimen Erica. Certainly his Palms were beautiful specimens, and mine were pushing out of the pots when I saw them. J. G. Weston

GROWING EARLY MELONS IN POTS (see p. 72).—I was interested in Mr. Hudson's remarks on the growing of Melons in pots. It is an excellent method for growing the very early and very late Melons. The roots of the plants and the body of soil are better under control than when the planting is done in mounds or borders, and this is a great gain, should the plants prove a little unsatisfactory in growth—as early and late specimens sometimes do. With the main crop, or summer batch, there is little or no difficulty, and heaps of soil in a house or frame will usually suit the purpose admirably. It was in a Herefordshire garden that I saw and had practice with the pot method, and very successful it proved. Bottom heat from pipes was employed, and the pots were stood on slates about 2 or 2½ feet above, with hot-bed material of leaves and manure placed between. The latter surface, by the way, provided good standing for pots and boxes of cuttings of bedding plants. C. Turner, Ken View Garden, Highgate.

PRUNING FRUIT TREES IN FROSTY WEATHER.—On page 57, *Southern Grower* states that he has never known injury to result from pruning Apple trees in frosty weather. If this is an established fact, it is a piece of gardening information worth knowing, and should receive wide publicity. The statement is really nothing

short of remarkable, inasmuch as it refutes the belief held and taught by the majority of gardeners, old and young. A reference to accepted authorities in books, calendar writings, and other occasional writers, will show that most of them advise leaving fruit tree pruning in abeyance during severe frosty weather—presumably to prevent any possible hurt to the uppermost buds, or even the wood. Personally, I have always followed this practice, so cannot support nor deny the assertion of *Southern Grower*. The opinion of other readers who have made observations on this subject would be valuable, and help to give settlement to this debatable operation. T. C.

POTATOS AND PREJUDICE (see p. 53).—The origin of the Potato seems wrapped in mystery. In a paper read by Mr. J. R. Baker before the Linnean Society in 1884, it was stated that Solanum Maglia, closely allied to *S. tuberosum*, and, like it, a native of Chili, produced similar tubers. Hybridisation trials were afterwards made at Messrs. Sutton and Sons' grounds at Reading, where *S. Maglia* was found to produce tubers as large as ordinary Potatoes, and of good quality when cooked. Were the trials carried out to a logical conclusion? If not, someone might carry them out. *S. Maglia*, *S. Commersonii*, *S. Jamesii* might all be crossed with *S. tuberosum*, the resultant hybrids re-crossed together, and by selection we might get Potatoes of a hardier constitution and less subject to diseases. This should be worth the doing, as Potatoes are now literally in everyone's mouth, though when first introduced they were considered as “fit only for swine.” C. E. Bridgett, *The Gardens, St. Helens, Hampton Wick.*

MOLES.—The war is giving the mole its opportunity, and in some parts of the country the activity of these animals is converting pasture land into a miniature model of the Somme front. Their earthworks are extending continuously, and the damage which they are doing must be very considerable. A. X.

SELECT VEGETABLES.—I welcome J.'s friendly remarks on the above, on p. 71, relative to my notes of the previous week in the *Gardener's Chronicle*. My reason for suggesting early and mid-season varieties of Potatoes was that early tubers are bound to be in large demand, and the ground can be cleared of them in good time to accommodate some other crop this season, and mid-season varieties, owing to their early maturing, are more free from disease than the late varieties. I am entirely in accord with J., as to the value of lime where the soil is deficient in that substance. Scotch and Cottager's Kale have proved their worth during the severe spell of cold weather this year. They have come through practically unharmed, whilst the majority of other greens are almost ruined. Asparagus Kale is, unfortunately, much subject to disease, and fails to do satisfactorily in many places. Mercury is one of the easiest vegetables to grow, but the flavour is not always appreciated. I did not wish to ignore the value of Peas and the various kinds of Beans. My object was to mention particularly those vegetables which would give a more or less continuous supply throughout the year, and especially during the winter. Edwin Beckett.

WHITE WOOD STRAWBERRY.—Can any of your readers tell me anything of White Wood Strawberries? I came across the mention of this variety in Jane Austen's *Emma*, which novel was first published 101 years ago. Readers of Jane Austen will remember the page devoted to the Strawberries growing in Mr. Knightley's garden. “Strawberries, and only Strawberries, could now be thought or spoken of. The best fruit in England—everybody's favourite—every sort good—hautboys infinitely superior—no comparison—hautboys very scarce—Chili preferred—White Wood finest flavour of all.” Was the White Wood Strawberry only a cultivated variety of the wild Strawberry? If not, what was it? The Strawberry which so appeals to the rare taste of Jane Austen would be well worth growing. A. X.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

FEBRUARY 15.—*Present:* Sir Everard im Thurn in the chair; Messrs. W. Hales, E. A. Bowles, W. C. Worsdell, J. Ramsbottom, R. H. Pearson and F. J. Chittenden (hon. sec.).

Tulipa Kaufmanniana.—Mr. J. H. Chapman exhibited flowering plants of *Tulipa Kaufmanniana*, a species introduced to cultivation about 1877 and awarded F.C.C. 1897. The plants shown were dwarf, bright rose in the back of the exterior segments, yellow at base inside, with a carmine spot about midway down the segments inside, and margined with pale cream or white. They were thus somewhat different from the four certificated and from those figured in the *Garden* or the *Bot. Mag.*, and were, further, easy to propagate, which some forms of this species are not. The whole of Mr. Chapman's stock had been derived from one bulb.

Stipules of Hawthorn.—Mr. W. C. Worsdell showed specimens of leaves from *Crataegus sinuata*, showing intermediate steps from leaf segments to so-called stipules and demonstrating that the latter belonging to the leaf blade, not to the leaf base, as true stipules do.

Leaves of hybrid Orchids.—Mr. J. Ramsbottom exhibited a series of slides showing the characters of leaves of hybrid Orchids. The series included sections of the leaves of thirteen primary hybrids and their parents:—

	♀	♂	Hybrid.
<i>Cochlidia Noezliana</i>			× <i>Aida aurantiaca</i>
			(Athyrid)
<i>Cochlidia Noezliana</i>			× <i>Miltonia vexillaria</i>
			× <i>Miltonia Harwoodii</i>
<i>Cochlidia Noezliana</i>			× <i>Odontoglossum cordatum</i>
			(<i>Odontiodia Craveniana</i>)
<i>Cochlidia Noezliana</i>			× <i>O. Harryannum</i> (<i>Odontiodia Charlesworthii</i>)
<i>Cochlidia Noezliana</i>			× <i>Oncidium incurvum</i>
			(<i>Onciodia Charlesworthii</i>)
<i>Cochlidia Noezliana</i>			× <i>O. macranthum</i>
			(<i>Onciodia Cooksonia</i>)
<i>Laelia cinnabarina</i>			× <i>Epidendrum prismatocarpum</i> (<i>Epilaelia</i>)
<i>L. tenebrosa</i>			× <i>E. prismatocarpum</i>
			(<i>Epilaelia</i>)
<i>Odontoglossum Edwardii</i>			× <i>Cochlidia vulcanica</i>
<i>Odontoglossum Edwardii</i>			× <i>Boschii</i> (<i>O. Antiopei</i>)
<i>O. Fro-Skinneri</i>			× <i>Miltonia</i>
			(<i>Schroederiana</i>)
<i>O. Fro-Skinneri</i>			× <i>O. Edwardii</i>
			(<i>O. Grogoniae</i>)
<i>Vanda teres</i>			× <i>V. saavis</i>

Also two secondary hybrids.—
Odontiodia Charlesworthii × *Odontoglossum Harryannum*
 (=*Odontiodia Brownii*)
Odontoglossum Fro-Skinneri × *Odontiodia Charlesworthii*
 (= *Odontiodia Irene*)

They had been prepared by Mr. Charlesworth, who was studying the structure of hybrid Orchids, and it was found that where a structure existed in both parents, but developed to different degrees in them, the hybrid usually showed the same structure developed in an intermediate fashion; when a structure was present in only one of the parents it might or might not be present in the hybrid, and if present was usually less well developed than in the parent possessing the character.

Large Rhododendron.—Sir Everard im Thurn exhibited photographs of a tree of *Rhododendron arboreum*, growing in the rain forest of Ceylon, to call attention to the huge size of its trunks of which there were several—each almost as large as a man's body, and showing great buttresses and twisted freely developed along them.

NATIONAL CHRYSANTHEMUM.

FEBRUARY 19.—The Executive Committee of this Society held a meeting at Carr's Restaurant, Strand, on this date, Mr. T. Bevan presiding.

The secretary read the correspondence between himself and the B. H.S. relative to the show that the N.C.S. will hold next autumn at the Drill Hall, and the terms were considered satisfactory. Details of the classes, etc., will appear in the new schedule which the Sub-Committee were authorised to prepare and issue at an early date.

The report of the Finance Committee was considered encouraging. It was recommended that prize-money to the extent of £45 be offered at the next show, without counting the amount of special prizes.

The election of committees then followed. Of the Floral Committee one-third retire by rule annually. The new members, who will hold office till 1920, are Messrs. Ballantine, Curtis, Emberson, Prickett, H. Wells, and T. Stevenson. There being a vacancy in the third retiring next year, Mr. A. Robertson was elected to fill the place till then.

The election of members to fill the places in the Finance, Schedule and Publication Committees resulted in no change being made.

SCOTTISH HORTICULTURAL PRESIDENT'S ADDRESS.

FEBRUARY 6.—The first ordinary monthly meeting for the session of this Association was held in the Guild Hall, 5, St. Andrew Square, Edinburgh, on this date. Mr. Pirie, the retiring president, occupied the chair, and introduced his successor, Mr. John Phillips, who delivered his inaugural address, taking as his subject, "Horticultural Topics and Post-War Problems."

Mr. Phillips' remarks were as follows: "If I am left to read the signs of the times aright, it is my duty to continue to make good progress in the future, we shall have to adapt ourselves to greatly changed circumstances, and bring our machinery completely into line to meet the new requirements of the country. All industries will, it goes without saying, be greatly influenced and modified by the conditions which will result from this great war. To take one instance, it is doubtful if we shall see in our day a re-assertion of large Chrysanthemum bloom growing for exhibition purposes, and without these how, for example, is it possible to hold a great Chrysanthemum show such as we have been holding for the last thirty years? Every industry has become more or less disorganised, and when horticulture comes into its own again, as no doubt it will, we may be quite certain that the conditions will have vastly changed. At first there will be the labour question. Many of our young gardeners, who have gone to fight for King and country, and freedom and right, will, alas! never return, and many more will come back broken men. There will also be a financial difficulty. The huge cost of the war will cripple the nation for many years to come, and many who have hitherto spent large sums on the upkeep of great horticultural establishments, will be so severely taxed that they will be unable to do so, and without such establishments great horticultural exhibitions cannot exist. But this does not mean that horticulture must take a back seat. On the contrary, I believe that horticulture will receive a great stimulus from the war, and that it will come now to the front than ever after it is over, but it will be a somewhat different horticulture from that of pre-war days. The great cry at present is to increase the food supply of the country. In normal times we heard nothing of this cry. Why? Simply because we were quite content to take things as they came, and this laissez-faire, or let-alone policy held sway in almost everything. Now, under the pressure of war conditions, and especially on account of the German submarine menace, things have changed in this respect. We now realise, as we have never realised before, what it means to be dependent on overseas countries for the bulk of our food supplies, and when we are faced, as we are at present, with the risk of their being greatly curtailed, or perhaps cut off altogether, we begin to put our house in order. It wakes us up to the importance of our home resources

in food production, and how they have been neglected, and if we cannot afford to neglect them in a time of stress like the present, how can there be neglect justified in times of peace?

And there is no doubt that in many ways they have been neglected. Take fruit-growing for example. It would, of course, be absurd to try to grow fruits here under glass which can be grown out-of-doors in other countries at a minimum of expense, and which can be brought to our doors at a price with which we could not compete. But in many parts of the United Kingdom hardy fruits like Apples and Pears, Plums, etc., can be grown quite as well, and in some parts of the country even better, than they can be grown abroad; while the small fruits can be grown anywhere. To take an example for illustration. Why is it that so many Apples are imported into this country every year while so many of our own growing go to waste? It is simply because the imported fruit is properly graded and more carefully packed than the home-grown article, and therefore the bulk can be sold from the sample. It is not because the imported fruit is of finer quality; it is simply because ours is not graded, and it is improperly packed. The outcome of this is, of course, that the buyer prefers the imported fruit, because he knows he is getting uniformity of quality, and that he can depend on this uniformity when he buys from the sample. It seems a very simple difference, but it makes all the difference between a remunerative price and an unremunerative one to the grower. And while I am on the subject of fruit, I would like to make a few remarks on another aspect of the matter, namely, the preservation of such fruits as Plums, Cherries, Gooseberries and small fruits generally, as well as certain vegetables, in the fresh state by sterilisation. It is painful to read, in a time of great stress like the present, of tons of good Plums rotting, as was the case last year in orchards in some parts of England, for the want of sugar to preserve them with, when by this simple process of preservation by sterilisation, requiring nothing but a few comparatively inexpensive appliances, and no preservative whatever except plain water, the whole of this waste could have been avoided, and a substantial addition made to our food supply. And it is not only in a case of this sort that the process would have its use, for fruit thinnings, most of which are wasted in ordinary course, might be preserved in this way; while by judicious thinning a substantial addition would be made to the weight of the fruit left to mature on the trees or bushes. One could multiply instances of neglect of our resources, both in fruit and vegetable growing, and even in the case of the Potato, a food plant which has bulked more in the public eye recently than any of the other food plants except the cereals, we find from statistics prepared by Professor Middleton, of the Board of Agriculture, that when we compare our production of the precious tuber with that of Germany we are a very long way behind.

Then there is the question of allotments, regarding which so much is being done just now, but in this also we are merely following the lead of others, for far more food is produced from small patches of land in other countries than in this. The growing of vegetables on allotments is undoubtedly a great aid to the food supply of many people where it is properly conducted, and under suitable conditions, especially in times of stress and high prices for articles of food.

Before leaving this important question of food-producing plants, I would like to say a few words about another aspect of it which is bound to claim a good deal more attention than it has hitherto done, but it is one exclusively for scientific investigation, namely, the sterilisation of soil for growing purposes. As you are aware, the object in soil sterilisation is to kill out all the injurious organisms, and to leave unharmed those which are beneficial to the plants. This, it has been conclusively proved, can be accomplished; but, unfortunately, it can only be done on a comparatively small scale in practice, and is, therefore, only applicable to soil used in the cultivation of plants grown under glass. What is wanted is a simple and inexpensive method of treating soil in the open over large areas, and

the advantages of the still no doubt reap a rich reward. For inside work, the common method is by means of steaming, which is quite a simple process, but one which involves considerable initial expense, as a steam boiler and accessories are necessary for its accomplishment. This process has been advocated by many growers, but belief in its efficacy is by no means universal, as may be seen from the following statement by a "Market Grower," in a recent horticultural trade journal: "For several years," this grower states, "I have used steam in sterilising soil, but always failed to see any good result from the process, which, with the labour involved, was distinctly expensive. Whenever I met a grower who used, or had used, the steam method, I made careful enquiries as to opinions and results. One gentleman who grows Tomatoes on a fairly large scale, the crop of which is his side means of living, has a steam boiler for sterilising, but the last time I saw it the chimney had fallen away and the whole thing was derelict, plainly showing he had lost faith in steam. He gives the soil a rest by using boxes for the plants for a year, and treats the soil with creol. Another grower near by who has about 50,000 Tomatoes (and nothing else) does not steam. Another fairly large grower, who has done a lot of experimenting with various methods of sterilising, says that he believes steam to be positively harmful. He times his soil well, and after that is dug in, uses a fungicide, and covers the ground with fresh soil from the field. These are the reasoned opinions of men who have worked hard for the money and position they have, and who throw away no chances of success if they can possibly help it."

There is one other matter which will occupy much attention after the war, and that is education. Already the subject is receiving a good deal of attention from educational authorities in anticipation of post-war conditions, and, of course, it is to the technical aspect of it that the greatest amount of attention will have to be given if we are to hold our own in the commercial and industrial, as well as the scientific world. We are fortunate in Edinburgh in having a well-equipped agricultural college, in which there is an excellent curriculum in horticulture, and I trust that whatever developments may take place in connection with it the interests of the practical gardener will not be lost sight of, and that means will be adopted, not only to enable him to take full advantage of the instruction provided there, but to remove the financial disabilities which at present beset him. The importance of imparting technical instruction to the practical man has not, I think, been so fully grasped by those in authority in educational matters as we could wish, and I am sure we all hope that it will receive more attention than it has done hitherto. But there is no royal road to learning, and in horticulture as in other things sound technical knowledge of the subject can only be acquired by strenuous effort and close application. In gardening, as in everything else, success invariably goes to those who show the greatest determination to overcome the obstacles which lie in their paths, and the gardener who understands the scientific principles which underlie the multitudinous operations that go to make up the cycle of his year's work will have a better chance to overcome them successfully than those who are merely guided by rule of thumb methods. My advice, therefore, to all young gardeners, is to embrace every opportunity which presents itself to acquire knowledge of the technique of the subject.

In recent years gardening has made great progress in almost every branch, and in many establishments there have also been great changes in the class of plants grown. In many cases plants like Crotons and Dracenas and other old favourites of our younger days are finding their way to the rubbish heap, and there is a distinct tendency generally to a freer use of hardy subjects for outdoor decoration. Such plants as Sweet Peas, Antirrhinums, and other annuals, now take a much more important part in garden decoration than they ever did before, and the new types of Roses have almost revolutionised decorative gardening. But in no branch of horticulture perhaps has more pro-

gress been made than in our knowledge of scientific manuring, and in connection with this I would like to refer to the valuable and extremely useful paper by Mr. Chisholm on this subject, which was read at one of these meetings last session, and which appears in the last volume of our *Transactions*. It is sometimes said that our gardeners are not so good as they used to be. With that I do not agree. I think we have better growers than ever we had, and I am quite sure that the Scottish gardener will always maintain the deservedly high reputation as a cultivator which he has held in the past.

I cannot bring these remarks to a close without a reference to the part which women are now taking in horticulture. The employment of women in gardening is no innovation, for they have been so employed, in both horticulture and agriculture, for centuries, if not from the very first. But the lady gardener, as we know her, is very different from the mere worker who was formerly employed in gardens, whose function it was to perform certain operations which could not be classed as anything else than mere drudgery, and which she had to do for a living. Now we have the educated woman coming into the field, and her aims are quite different. She wants to take her place with men gardeners, and to compete with them, and we all welcome her advent. But if the lady gardener is to succeed, as men have succeeded, she must be prepared to go through the mill in the same way as they have done, otherwise she will fall behind in the race.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

FEBRUARY 1. *Committee present:* The Rev. J. Crombholme (in the chair), Messrs. R. Ashworth, D. A. Cowan, Dr. Craven Moore, J. Cypher, J. Evans, P. Foster, A. R. Handley, D. McLeod, W. Shackleton, H. Thorp, and H. Arthur (secretary).

AWARDS

FIRST CLASS CERTIFIED VES.

Cypripedium Lloyd George (Anacam Hyacinth - Beckmann), a fine well formed flower, with broad petals, the dorsal sepal with a broad margin of white; *C. Mabelis macropetala West* *Pand. var.*, similar in form and colour to *Aletrisides Bluntii*, from S. GRAYNER, Esq.

Bress. Cattleya Ascension (B. C. The Baron - C. Mendel), a large flower of good form and rich colour, from R. ASHWORTH, Esq.

AWARDS OF MERIT.

Odontodia Linda (Oda, Diana S. Odm. and hbr.), *Odontoglossum wallonianis Cogniaux* var. *polypetalum (C. crispum)*, and *Cymbidium Mendelii var. Eucherianum (Anacam - Laevis - ussleri)*, all from Dr. CRAVEN MOORE.

Odontoglossum crispum varium superbum, and *Odontodia Mendelii var. superbum (Odm. C. Britannia - Oda Chalesworthii)*, both from P. SMITH, Esq.

Sophia Cattleya Ashworth (Doris - Bluntii), from R. ASHWORTH, Esq.

AWARDS OF APPRECIATION.

Odontoglossum Peckii var. The Bay (Osdalton - Crispum), and *O. Messy Sturmerianum - King Emperor*, both from P. SMITH, Esq.

O. Ceres De Andra Jap. O. Larina (Smith - Jap.), from S. GRAYNER, Esq.

Odontodia Armstrongii (Odm. Armstrongii - Oda. Voglsteini), and *Odontoglossum Davis (Ussleri - Crispum)*, both from Messrs. ARMSTRONG AND BROWN.

PUBLICATIONS RECEIVED. *The Cultivation of Parsnips.* Special Leaflet No. 70. Board of Agriculture and Fisheries, Whitehall Place, London.—*Potato-Growing in 1916 on the University Farm.* (School of Agriculture, Cambridge University).—*Symons's Meteorological Magazine*, February, 1917. Price 4d. (London: Edward Stanford, 12-14, Long Acre.)—*Finger and Tail.* Leaflet No. 2, Eastern Counties School of Agriculture, Cambridge.

CROPS AND STOCK ON THE HOME FARM.

PARSNIPS FOR STOCK.

FOR COWS in milk, and for sows, Parsnips are useful; the roots contain much valuable food. Where butter is made they must, however, be fed in reasonable quantity with other foods, such as Mangolds, hay and meal. A deep, medium loam, as free from stones as possible, is the most favourable soil for Parsnips; it should be deeply ploughed in the autumn and again in February, choosing dry weather, this time cutting the soil across, cultivating and harrowing freely to obtain a good tilth. Seven pounds of seed per acre, drilled in rows 18 inches apart, as early in March as possible, is sufficient.

BRUSSELS SPROUTS.

FOR COWS in milk during March and April, when the Cabbage crop has come to an end, Brussels Sprouts are valuable, as they provide much green food. A tall, strong-growing variety like Sutton's Exhibition should be selected for its length of stem, as it is not merely the size of the sprouts that are a gain but the greatest bulk of green food should be the aim. Deeply ploughed, heavily manured, stiff soil at the cultural conditions necessary. Sow the seed early in March thinly in a cold frame, encouraging a sturdy growth. From there the plants can be put out into their permanent quarters in rows 2½ feet apart, a similar distance from plant to plant in the rows. Raising the plants in a frame affords extra time for growth, which means larger plants and more food. Frequent stirring of the soil about the plants accelerates growth, as will also an occasional sprinkling with sulphate of ammonia or soot.

FATTENING CATTLE.

AT THE present time there is such a demand for home-grown beef to meet the requirements, that it behoves all who can to assist in producing more cattle. The more is grown and fattened at home, the greater likelihood there will be of a lowering of prices. Steers from two to three years old should be fattened as quickly as possible. The longer they are in becoming fit for the butcher the more expensive they become. Parsimony is not economy in feeding. Liberality with best food shortens the period of fattening.

I do not agree with the fattening of heifers for food, except in the case of barrenness. Heifers have a quite different function to perform. There are three methods of housing cattle for fattening in winter—shutting them up singly in pens, tying them up in stalls, and allowing them to run loose in a strawyard where they can have shed-protection from inclement weather. Any of these methods can be made satisfactory, if absolute quiet for the animals can be obtained. The food rations should be varied. Mangolds and Swedes, either separately or together, in equal parts, are the safest winter food. Add to this a small quantity of sugar Beet and a little finely chaffed Hay or Oat straw, with Barley and Bean meal in small quantities. The roots should be cleaned and cut into slices, or pulped smaller, and mixed together with the chaff in a heap, but not more than one day's allowance should be given as a greater bulk would quickly become sour, and that is very undesirable.

In addition to the food already mentioned, oil-cake, with an equal quantity of cotton cake, is also required. The first feed in the morning should be the cake, starting with 2 lbs. per animal, increasing this gradually until the last fortnight, when 6 lbs. daily should be given. After the cake is eaten the root mixture should be given, 2 bushels in the morning, the same in the afternoon, and for the last month increase the quantity to 6 bushels per day; for the last two weeks give the feed four times daily. As long as they clear up the whole, continue to give a little extra. With such a quantity of roots, some animals will not drink water, others will; all should have the opportunity. The feeder will quickly know the peculiarities of each animal and should act accordingly.

In the evening a handful of long hay should be given the animals for amusement. Plenty of

straw should be given for bedding, remembering the more they have the greater the quantity of manure made. No manure can be of higher value than that from cattle so highly fed.

CLOVER FOR HAY.

Now that so much Clover is required for Army horses, in addition to that needed for home consumption, it behoves all who have the opportunity to produce as much as possible. What is known as clean Clover hay—Red or Broad Clover—is preferred by some persons for horses and sheep. When Clover alone is grown the second crop in the season (August) can be utilised for seed if of a good strain, free from objectionable weeds and parasites, as Dodder. Clover seed in a favourable season is remunerative.

A greater bulk of hay can perhaps be obtained from a mixture of Broad Clover and Italian Rye Grass, or Hampshire or Devon Bents, in the place of the Italian Rye Grass. Two tons per acre of most excellent hay from such a mixture can generally be reckoned upon. The objection to Italian Rye Grass is that it is such a roborer of the soil, and as Wheat or Oats are generally the succeeding crops, the best results cannot be expected without additional stimulating food for these crops. Hampshire or Devon Bents do not grow so vigorously, therefore they do not rob the soil so much. Clover is usually sown with Oats or Barley in March, or among autumn-sown Wheat in April 12 lbs. of Clover seed and 1 bushel Italian Rye Grass or Bents are ample. Both should be sown separately, with the hand seed barrow wheeled evenly over the land at the same time that the corn is sown, if possible, and harrowed in along with the seeds. Sometimes these crops are also sown in February or early in March, which is too early for frost may occur. The first week in April is a good time to sow the seed among the Oats and Barley, drawing light harrows over the plot, finishing off with the roller if the weather is dry. Once harrowing will not injure the seed, and effectively buries the seed. In sowing Clover along with autumn sown Wheat in April, where the soil is stiff the surface usually is hard and caloused, owing to winter rains, but harrows should be drawn over the Wheat crosswise to the drills before sowing the Clover, this ensuring a tilth for the seed, and once after finishing off with the roller to make the soil firm about the roots. *E. Molynour*

On the death of their father, George, Thomas, and Edward Walpole entered into possession of Mount Usher, and developed it. As space became limited the grounds were gradually extended, until the present considerable dimensions were reached. The brothers Walpole quickly realised the great possibilities of Mount Usher, especially as regards the cultivation of what are generally known as half-hardy plants, and they made many and interesting experiments in that direction. Mount Usher is at present the most interesting and edifying garden of its size in Ireland. George was the first to die, and Thomas followed not long afterwards. Mr. Edward Walpole was a man of the kindest disposition, of sound common sense, and of great enterprise. His early days were passed in Waterford. All Irish gardeners will rejoice to know that Mount Usher is to be kept up by the new owner, Mr. E. H. Walpole.

GEORGE MASSEE.—We record with deep regret the death of Mr. George Edward Massee, who, from 1883 until 1915, held the post of Principal Assistant in the Herbarium at Kew. Mr. Massee, who achieved a wide and

THE LATE GEORGE MASSEE, A.M.H.

Obituary.

JOHN GALE.—*Horticulture*, U.S.A., records the death of Mr. John Gale, nurseryman, of Chicago, and a specialist in Asters. He was a native of this country, and settled in America as a young man of 24 years.

GEORGE SINCLAIR.—We hear with regret of the death, on the 18th inst., of Mr. George Sinclair, market gardener, of Prestonkirk, East Lothian, at the age of 70. Mr. Sinclair was a leading member of the Edinburgh Market Gardeners' Association, and for many years on the Fruit Committee of the Royal Caledonian Horticultural Society. He was also a lecturer at the Heriot-Watt School, Edinburgh, for several sessions.

EDWARD WALPOLE.—Our contemporary, *Irish Gardening*, in announcing the death of Mr. Edward Walpole, of Mount Usher, Co. Wicklow, at an advanced age, offers the following tribute to his memory. Mr. Walpole's death will evoke genuine feelings of regret in the hearts of many who had the privilege of enjoying his friendship. He was the last of the three brothers who created the beautiful garden at Mount Usher, and filled it with rare and beautiful plants, and who made it an easy matter for all interested in gardens to see, hear, and enjoy. Mount Usher was started very many years ago as a small country residence to which the brothers Walpole were brought by their parents to spend holidays in the country.

well deserved reputation by his contributions to our knowledge of fungi, and particularly of the fungous parasites of cultivated plants, was born at Stampton, in East Yorkshire, in 1859. Destined to follow his father's career, that of farming, Mr. Massee showed in his early years a decided bent for drawing and nature. Sent to study art at the York School of Art, he became acquainted with Dr. Spruce, the botanist and traveller, who was related to Massee's mother. As he records in the *Journal of the Kew Guild*, Mr. Massee drew most of the illustrations for Dr. Spruce's work in Hepaticae. After his stay in York, Mr. Massee went to the West Indies and South America to study plants, and collect Orchids. On his return he continued his botanical studies, combining them with painting. Subsequently Mr. Massee proceeded to Kew, and in 1895 succeeded the late Dr. M. C. Cooke in the headship of the Mycological Department. Since his retirement, Mr. Massee had lived at Park Place, The Common, Sevenoaks. His death followed on a short illness; he was buried at Richmond Cemetery on Wednesday, February 21. Of his books on fungi, those which dealt with pests enjoyed a wide circulation. They embodied a vast amount of personal observation, and were written in a direct and clear style. Mr. Massee was remarkable in personality as well as distinguished in science; of concise turn of speech, "but to those men that loved him sweet as summer" and the numbers of those who loved him were many.

		Violets, single, per doz. bun.	2.6-3.0
Remarks.			
With the exception of a further increase in the supply of Carnations, the market is similar to those of last week. All small white flowers are very scarce and dear. Especially was this so during the last week of the month, at the momentary arrival, here of the known variety, and French flower. High prices this week are due partly to French paper white Narcissus, which came about last for this season. Violets, Mimosa (Acacia), Balausta, and Anemone are getting more plentiful. A few barrels of white Stock are coming to hand. There is a good demand.

BLUE HYDRANGEA: W. J. M. Pot the plants in peat, adding two-fifths leaf-mould and one-fifth sand, 10 per cent. of powdered slates, 5 per cent. sulphate of iron—or a larger quantity of iron slag—and 10 per cent. of ammonium sulphate. The plants must be prepared a year in advance of flowering, and all traces of the ordinary soil in which they have grown removed. Lime should not be used, and it is necessary to employ rain-water for the roots. Water the plants twice a week during their growing period with water containing 4 ounces of sulphate of iron to the gallon.

CLIMBERS: J. James. The majority of the climbers mentioned in your list do not require pruning at the usually accepted sense of the term, but should have the weak growths thinned out and the remainder properly trained in early spring. The exceptions are Abela chinensis, Biddiana Colera, Clematis Gloire de Versailles, and C. Ceres, all of which flower on shoots of the current season. These plants should be pruned to within two or three eyes of the base of the previous year's wood, except where the shoots are required for extension. Clematis Verticillata flowers in spring 2 on the old wood, and any thinning of the growths that is necessary should be done immediately after the flowers are over.

CUCUMBER CUTTINGS: G. W. It is not an easy matter to destroy such ground pests as wireworms, leather-jackets and cockchafers at this time of the year. Gas-lime is the best cure, but you cannot use gas-lime in spring, because it would burn the crop even more than would the pests. At least six weeks must elapse before ground treated with gas-lime can be planted or sown. We are informed that sick naphthalin powder is applied in the trenches at digging will destroy such pests as wireworms and cockchafers, and it is well known that superphosphate, nitrate of soda, and other fertilisers of this character act as

deterrents to pests underground. Soot, lime and wood ash have also a value in this respect. Agricultural salt at a rate of 2 cwt to the acre is said to be particularly acetic for this purpose.

DESTROYING TREE ROOTS: W. F. Tree roots can be blown to pieces by the use of coarse blasting powder, or tonite or dynamite cartridges. Tonite cartridges are considered safer than dynamite cartridges, and for butt blowing are very effective. 2 ounce, 3 ounce, or 4 ounce cartridges may be used according to the size of the butt. Bore slanting holes from the side to the centre of the butt large enough to take a cartridge. A cap and fuse must then be attached to the cartridge and the hole around the fuse filled in firmly with wet sand. The fuse must be long enough to allow the operator to reach a safe place before the explosion. It is as well when purchasing cartridges to procure proper instructions at the same time. A 5-ounce cartridge might be tried on a butt at first, giving a 4-ounce one if the first does not appear to be sufficiently powerful. When using blasting powder a hole an inch in diameter should be bored to the centre of each butt. Place a time fuse in the centre and fill round with powder to within 3 inches of the top of the hole. Press the powder firmly with a piece of stick, then over the powder ram some powder firmly down, filling the mouth of each hole with clay. Light the fuse and get to a safe distance before the explosion. It is difficult to advise a place for obtaining explosives at the present time, and you would probably do best by ordering what you want through a local gunsmith.

MARKET MEASURES: B. J. C. "Bags" of Beetroot, Carrots, Onions, Swedes, and Turnips weigh 1 cwt. each. "Bags" of greens weigh each about 40 lbs., filling the 1 cwt. bag to its utmost capacity. Celery, Celeriac, and Leeks are sold by the dozen. Cucumbers in lots of from 2 to 4 dozen, according to their size.

MEHULLA MAGNIFICA: W. S. M. Bombay. Medinilla magnifica is a tropical evergreen plant, and in the spring and summer months requires a moist atmosphere, and temperature ranging from 70° at night to 90° by day in sunny weather. During this period the plant needs a liberal supply of water, both at the roots and overhead. In winter the minimum temperature should be 60°, and less water is required, but on no account should the plants be allowed to become so dry as to cause the foliage to flag, or the leaves will fall prematurely. To promote a natural, free development of flowers the growths should be ripened thoroughly, therefore a light, sunny position is necessary; in very bright weather the plants should be shaded lightly for a few hours during the middle of the day. Medinillas are free rooting subjects, and when grown in pots or tubs are benefited, during the growing season, by frequent applications of manure water. Starving them in small pots is not favourable for the development of flowers. They succeed best in a compost of fibrous peat, leaf-mould and loam in equal parts, with sufficient sand added to render the soil porous.

NAVES OF PLANTS: G. C. Anverley, Azadea Mrs. Carmichael.—1, E. L. 1, Codraem (Crotom) trilobum; 2, Codraem Weismann; 3, Codraem Johannes; 4, not recognisable from the bruised leaves sent. Send when in flower.

ONION BULBS: J. S. Onion bulbs which are intended to produce seed should be planted at the earliest possible moment, when the ground is in a suitable condition, and put in a good, sunny position. The bulbs should be three parts buried, and a small quantity of finely sifted cinder ashes placed over the exposed part.

GLAMORGAN COUNTY COUNCIL. HORTICULTURAL DEMONSTRATORS AND ADVISERS.

The Glamorgan County Council have Applications for the Appointment of Horticultural Demonstrator and Adviser for assisting the Occupiers of Cottage Gardens, Allotments, and Small Holdings in such areas as will from year to year be selected within the Administrative County of Glamorgan.

Applicants must possess an Examination Certificate of the Royal Horticultural Society, and have served as apprentices to gardeners, and have held situations in which they were in charge of and responsible as Foreman or Head Gardener for flowers, fruit, vegetables, and hot-house work.

Experience as journeyman in vegetable gardens will be deemed an additional qualification.

Applicants must provide and be able to ride a bicycle salary, 45s. per week, with an allowance at the rate of 25s. per annum in addition for the upkeep of a bicycle.

The appointment will be for one year, subject to one month's notice on either side, and will be renewable annually.

The person appointed will be required to give his whole time to the service of the county, and reside where from time to time directed.

NOW IS THE TIME TO PLANT KELWAY'S Gladiolus Bulbs (all British). If you wish to have a gorgeous display of flowers in the autumn when blooms are scarce, Kelway's, the champion growers of Gladioli, are offering a really superior and reliable variety in all colours at a greatly reduced price during the sale. Write at once for their illustrated catalogue, and make a selection that will enable you to send flowers to the Wounded Soldiers in Hospitals and Nursing Homes, from July till the frosts come. Gladioli are invaluable for cutting, as every bud opens in water. They last for a fortnight, and are so bright and cheerful that they are particularly well suited to hospitals. For decoration of all kinds the Gladioli are the best in the present market. Carriage paid and postage free for postpaid orders.

SEEDS FOR 1917.

It is none too early for garden lovers to think of seeds, but be sure the seeds you buy are seeds of quality. It is a gardening axiom that

RYDERS SEEDS

are the best, and despite the fact of a War Time price of 1½d. per packet, orders for these famous Flower and Vegetable Seeds are daily growing in volume. Seeds of quality cannot now be supplied, even by Ryders, in Penny Packets.

Ryders Illustrated Seed Catalogue Free.

Ryders 1917 Catalogue contains a large number of choice varieties not found in other lists.

Ryders offer in 1½d. packets such standard novelties as:—

- Tomato Bide's Recruit, 8 seeds for 1½d.
- "All the Year Round" Cauliflower.
- The New Chinese Celery-Cabbage "Pe Tsai."
- Lychnis Arkwrightii.
- Calceolaria Veitchii.
- New Double Cosmos, pink and white.
- Such Sweet Peas as Jean Ireland, President, Fiery Cross, The Lady Eveline, Yarrowa, and over 200 others.

Send a post-card to-day for your free copy of this Catalogue. Remember the one and only address and beware of imitators—no agents.

ALDENHAM IN WINTER.

ALDENHAM gardens are interesting at all seasons, and some of the winter effects are as charming as those of gay summer. Much planting has been done by the Hon. Vicary Gibbs for the purpose of providing colour in winter from the barks of certain trees and shrubs. In many cases such plants have been massed, giving the effect, from a distance, of large panels of colour. To those who have never seen the best use made of this aspect of garden decoration, the results would appear astonishing; it is most effective when done on a large scale. This is possible at Aldenham because the whole estate has, so to speak, been brought within the pale of the garden. It appears as though every spot that offered a suitable place for some rare or interesting tree or shrub had been put to the purpose, making the whole place one vast arboretum. Nor is this all; for miles beyond the suburbs of the estate choice trees have been planted by the road side, in field and meadow, and wherever else opportunity has been afforded thus to improve the landscape or beautify the villages. Sometimes a natural feature in the country, such as a sheet of water or grassy knoll, has offered an opportunity for Mr. Gibbs and his capable gardener, Mr. Edwin Beckett, to introduce a special kind of planting for securing particular effects.

It will be readily understood that in a garden containing such a wealth of ar-

boreal vegetation, and abounding with evergreen species of all kinds, many possessing variegated foliage, it is not only the coloured barks that are beautiful in winter. The Hollies, Yews, Eleagnuses, Lilies, Conifers, and such plants are most attractive, and give fine colour effects in their golden and silver forms. There is much natural dignity, too, in the winter contour of trees and shrubs, such as is presented by a tall group of rugged Scots Firs outlined against the sky or a background of woodland, graceful weeping trees, massive avenues of Cedars and Yews, rows of light and graceful Silver Birches, and russet undergrowths.

Some of the finest garden and park scenery is found in association with water, and Aldenham is fortunate in this respect, for it includes ponds, moats, streams, and a large lake. The lake is situated in about the centre of the park, and has been converted into one of the finest examples of its kind, forming a piece of ornamental water that is as interesting in winter as in summer. The best view is from the ornamental stone and red brick bridge, the architecture of which is in keeping with the house. The bridge carries the drive, that stretches for three-quarters of a mile from the Elstree road to the mansion, passing over the centre of the lake. From the gate to the bridge this broad, well-kept drive is bordered on either side with a double row of Horse Chestnuts, each tree of perfect symmetry; and from the bridge to the house the curved drive is astonishingly beautiful in winter with the stem colouring of various low-growing shrubs. They are planted in large, irregular shaped beds, the principal species being *Salix rosmarinifolia* (reddish-brown), *Spiræa Douglasii* (hazel-brown), *Cornus alba sanguinea* (scarlet), *Rosa rugosa* (silver-grey), and *Spiræa ulmifolia*.

The lake has been made from a pond and a piece of swampy land. Thousands of loads of soil were removed, the sides were concreted and set with rockwork to prevent displacement by wash and burrowing by rats, and the bottom puddled, making it absolutely watertight. Rising ground at one end has been transformed into a cave for a boat-house by the use of rugged masses of rock. It is approached by a winding grass path, and overhung by plants of pendulous and creeping habit. The mound over the cave has been planted as a rockery, with a great variety of shrubs and small trees. The most striking objects as we approach this planted mound are *Salix cardinalis* and *S. vitellina*, the stems showing scarlet and gold from afar. Other beautiful patches of colour are provided by the dark-red stems of *Cornus alba sanguinea*, the dark-brown leaves of *Spiræa confusa*; a big bush of *Viburnum Opulus* (the Guelder Rose), with light brown, crinkled bark; and here and there a Golden Privet. In contrast with the brighter colours is a big clump of the ever-green *Berberis stenophylla* and the *Aucuba*, covered with noble foliage, splashed with gold. Crowning the mound is a Lon-

bardy Poplar, tall and dignified in outline, and well suited to such a position. One of the rarest and most interesting trees at Aldenham is a Weeping Oak, planted near this spot. It is about 50 feet high, and has a clear, straight bole some fifteen or twenty feet before its branches. Another plant not often seen is the Weeping Privet. The dependent shoots carry the foliage very late, and the leaves turn almost black before they drop.

The weeping character of trees is best seen when the branches are defoliated, and Willows of this nature have a special grace and charm in winter, especially when reflected in the clear water beneath them. Amongst other plants that were contributing to the winter glory of the lake were Cotoneaster microphylla, the low, spreading evergreen branches sweeping the stonework almost awash with the water; *Osmanthus ilicifolius*, like a miniature Holly; *Cotoneaster bacillaris*, some of the black fruits still hanging on the branches; *Berberis Wallichiana*; Alders hung with their dark-brown catkins, the cut-leaved variety retaining a few of its deeply incised leaves; the fastigate form—*Alnus glutinosa pyramidalis*; Quinces, Weeping Elms, and bare, golden Poplars on the bankside; *Rhamnus Alaternus*, making a most perfect-shaped pyramid; *Stranvaesia undulata*, which might easily be mistaken for a Cotoneaster, with shoots of addressed habit, and gay with clear, scarlet berries; and the Mahonia, which gives a warm touch of colour along the stream side. The lake is fed at one end by a winding woodland stream, and the water is discharged at the other end by a miniature cataract which tumbles down large boulders over hung by *Berberis stenophylla* and similar shrubs.

STEM COLOURING IN THE WILDERNESS.

Leaving the lake, we will next describe the part of the gardens known as The Wilderness, where the best examples of stem colouring are to be seen. The Wilderness covers many acres. It is a good example of a "wild" garden on a large scale, consisting of a piece of sparse Oak woodland, carpeted with grass, in which are vast numbers of bulbs. The ground is sheltered on the north side by a belt of woodland. The Scots Pine grows here in all stages; some tall trees of this Conifer fringing the wood are exceedingly picturesque in winter, one old tree, that seems to lean against its fellows, being such as a painter might select as a subject for his canvas. Grass paths run in both directions, crossing each other at right angles, bordered by rare trees and shrubs. Huge, irregular shaped beds are planted for producing winter effects in coloured barks. Many of these plants are massed, giving the effect of large patches of colours on the landscape, such as *Salix vitellina* (yellow), *S. cardinalis* (red), *Cornus sanguinea* (scarlet), *Rhus typhina* (warm brown), *Leucosterna formosa* (one of the finest plants for green colouring), the common Raspberry (*Rubus Idæus*), *Populus Bollandiana* (white), *Rosa rugosa*

(grey), *Spiraea Douglasii* (reddish-brown), *Spiraea canescens* (brown), and the Snowberry (greyish-brown). Others selected for this purpose are *Pyrus arbutifolia* (*Aronia floribunda*) (almost black), *Spiraea umifolia*, *Rubus Giraldiana*, *R. lasiostylus* *disygos*, *R. phoenicolasius* (the Japanese Wineberry), *Paulownia imperialis* and the Golden Elder, most of which are cut down annually to make them produce a dense mass of their coloured shoots. There are large beds of *Euonymus europaeus*, that produce masses of scarlet fruits in autumn and early winter; *Hippophae rhamnoides*; *Rosa rubrifolia* (the blue-stemmed Rose), *Forsythia suspensa*, *Loganberries*, *Rubus polytrichus* (a beautiful new Chinese species), *Cotoneaster Simonsii*, *C. horizontalis*, *Exochorda grandiflora*, *Berberis Wallichiana*, *B. purpurea*, and the new *B. Sargentiana*, all of which contribute colour from berry, leaf, or stem in winter. Further varieties provided by clumps and beds of *Rhus glabra*

the left were a sheet of colour in tones of red and brown from the withered rushes and grasses, with here and there a clump of silvery Pampas Grass. A large bush of the evergreen *Veronica Traversii* was prominently seen from the spot where we stood and looked along the water. The shoots were tipped with light green, and contrasted with those of its companion, a Golden-leaved Box. Close by, the graceful, arching culms of *Phyllostachys Quiloi* swayed with the slightest movement of the wind, which was bringing down the few remaining leaves of the neighbouring *Cornus*. At the back, and almost overhanging the Bamboo, was a Weeping Larch, the old branch bases looking like yellow buttons, a few only retaining the straw-coloured shoots of last season. Underneath this tree is planted the new *Rubus irenaeus*, making a perfect carpet of greenery. The leaves of the Water Lilies had their edges seared by frost, and would

seemed quite a pygmy compared to the tall tree of *Acer palmatum* near by, whose deeply cut leaves were a russet brown before they dropped. The path is bordered with Periwinkle, small bushes of stone Lavender (*Santolina incana*), colonies of *Saxifraga cordata*, the foliage of which is too sheltered to turn ruddy, mossy cushions of other *Saxifragas*, Rock Roses, *Ericas* and the like. A few solitary fruits hung on the red Chestnut, which had plumped up its buds, but had not coated them with resin for protection, as the Horse Chestnut. At the foot of a waterfall in the stream was a big plant of *Lomaria Spicata*, whose fronds had collected a deep store of fallen tree leaves, which would protect the crown of young leaves from injury by frost. The shrubby border at this spot makes an intricate bending, following the irregular course of the stream, and a bluff that juts into the water is crowned with the new *Jasminum Beesianum* on a pole, looking very like a *Smilax*, and promising to retain its handsome foliage all through the winter. On another bend of the bank is a tree of *Cupressus Lawsoniana aurea*, its branches reaching almost over to the water, leaving only a narrow pathway to reach the next bluff, where a pendulous tree of *Gleditsia triacanthia* grows. At this spot the view opens on the avenue of Cedars, with rows of *Berberis subcordata* amongst them. Here the brown and russet of the water plants in the moats toned well with the golden and red stems of the Willows amongst them. The silvery Pampas Grass, along the banks, with the Bamboos of green and gold; *Salix lanata*, which has turned from grey felt to mahogany brown; and tiny colonies of *Euphorbia* (*Cyparissis*, with stems of coral-red and ruby-tinted leaves; all combined to make a charming winter scene.

FIG. 33.—CLEMATIS VEDRARIENSIS. FLOWERS PALE ROSE-MAUVE. (Photograph by E. J. Wallis)

CLEMATIS VEDRARIENSIS.

The hybrid *Clematis C. vedrariensis* (see fig. 33), is of French origin, the result of a cross between *C. chrysozona* and *C. montana rubens*, both these species being natives of China. *C. chrysozona* has creamy, pink-tinted flowers, and was first discovered in Yunnan by the Abbé Delavay in 1884, whilst *C. montana* has rosy red flowers.

The flowers of the hybrid are a delicate mauve-pink of pale rosy-mauve colour, changing with age to a lighter tint. The individual flowers are $\frac{1}{2}$ inch in diameter. The photograph, from which the illustration is reproduced, was taken on June 6, the plants being at their best during that month, though they carry blossoms during nearly the whole summer. The growth of the Kew plants suggests that in an open, limy soil *C. vedrariensis* will prove a showy and useful climber of moderately strong growth. A. O.

THE ROCK GARDEN.

FROST AND ROCK PLANTS.

ONE effect of a period of frost is to lift small plants, such as rock plants, either partially or wholly out of the ground, and thus leave the roots exposed. This is especially the case with plants that have been recently transplanted. Roots of the "star-fish" description, consisting of a central bud from which fleshy rootlets diverge, are particularly liable to suffer in this way; such are the St. Bruno's Lily (*Anthericum Liliastrum*), and *Ranunculus acemifolius*.

As soon as the soil is in good working condition, all small plants should be carefully examined, and where the roots are exposed they should be pressed firmly into the ground and top-dressed with a mixture of gritty soil and leaf-mould. Where this is insufficient, they should be taken up and transplanted. H. E.

lacinata, *Fuchsia Riccartonii*, *Rhododendron* in variety, *Hydrangea paniculata grandiflora*, *Rhus Cotinus*, *Arundinaria japonica*, *Hypericum calycinum*, *Spiraea arborea grandis*, *Buddleia variabilis* in variety, *Berberis Aquifolium*, and *Rubus fruticosus* fl. pl. A new plant that will be valuable for growing in the shade, and especially under trees, is the Chinese *Rubus*, *R. irenaeus*. The growth is like that of the Ivy, and forms a dense mass of foliage.

Beautiful as is this wild garden in winter, the shrubberies by and near the moats are equally interesting at this season. Our visit was made before the recent severe frost, and much in berry and leaf was lingering from autumn, but the Birches in the Avenue were completely debilitated, and their bark showed milk white; the branches, like filigree work, seeming too frail and slender to resist the gales of winter. The rows of Yews, avenues of Lombardy Poplars, and lines of Hawthorns looked of a stouter nature. The banks of the moat on

soon be gone, but *Typha*, the Reed Mace, stood out in full dignity above the water, its velvet brown poles arising from a mass of pale brown ribbons. The red-barked Willows on the bank had lost their leaves, and the huge foliage of *Gunnera* hung round the stalks like a tattered shroud on a pole. Under a tree of *Pyrus floribunda* was a carpet of *Euonymus radicans*, in tensely variegated where the sun reached the leaves. A narrow stone pathway leads to a tree of *Quercus coccinea* *Watereri* variety, encircled by a seat. The scene was enchanting enough to tempt us to rest. *Berberis yunnanensis* had lost its red leaves and appeared formidable in its aggressive-looking spines. *Epinediums*, encroaching over the flagstones, were most bronzed where most exposed to cold. The broad-leaved *Bambusa palmata* made a charming corner plant, whilst *Diplopappus chrysophyllus* revealed its golden undersides as the shoots moved. *Euonymus radicans* variegata

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT KEW.

A WEEK or so ago, when the outdoor departments were in the firm grip of frost and snow, it was pleasing to find so much of interest in the Orchid houses. Several groups of Calanthes were conspicuous, and numerous species and hybrid Cypripediums attracted attention. Among a number of Cymbidiums, C. Gottmanni was showy, and the delicately fragrant Platystichum glaucum was well represented. Cyclophorum Lowianum, Stenorrhynchum speciosum, Lycaste lasiocarpa, Odontonia longicauda and Phaius Sanderaiana were other noteworthy subjects in flower. It is interesting to see women gardeners, with supervision, in charge of the Kew collection and doing good work, the whole of the Orchid staff having enlisted in His Majesty's Forces.

BOTANICAL ORCHIDS.

A LIST of rare and little-known Orchids in flower at Kew during the early days of February will be of interest to readers who delight in uncommon plants. Eria trifimbriata, E. parviflora and E. stricta, Lepotes bicolor, Epidendrum Albimanum, and E. Wallii, Xylobium leucostictum, and X. conzatti, Cyclophorum Lowianum, Spiranthus australis, Oncidium barbatum, Anlostoma cernuum, Polystachya laxiflora, and Pleurothallis Sappia.

HYBRID ORCHIDS.

(Continued from Dec. 23, 1916, p. 300.)

Table with 4 columns: Hybrid, Parentage, and Exhibitor. Lists various orchid hybrids such as Brassia-Cattleya, Cymbidium, and others with their parentage and exhibitors.

NOTE FROM AUSTRALIA.

PHOENIX CANARIENSIS.

In the Gardeners' Chronicle of September 9, 1916, p. 122, Mr. J. H. Maiden, of the Sydney Botanic Gardens, writes about Phoenix canariensis growing in the Garden Palace grounds. He states: "Its history is not clear, but it was over thirty years old, and where it originally came from I cannot ascertain." This information is not accurate, as its history is well known. When I had charge of the beautiful Garden Palace grounds, much of which I designed and laid out, I suggested to the late Mr. Charles Moore, Director of the Palace Gardens, Sydney, that a group of Palms should be chosen suitable to the surroundings. One of the first of these I saw which there were then growing a number of varieties of the Phoenix, Amphithus schaffelinii and A. tricolor, and a few species and varieties of Canna. I told Mr. Moore what the group of Palms I had in mind were Phoenix Canariensis, East-India, Queen-land, and the suggestion of the work being carried out. There is considerable controversy about the advisability of planting in the open certain species of Palm, Phoenix canariensis, but even so, Mr. Moore gave me in his hand I had in mind a group of Palms, and the planting was carried out in the same course. Most of the Phoenix I had in mind were vigorous specimens, all well established in 8 inch flower-pots. Mr. Moore informed me that the seeds of most of these Palms, including Phoenix canariensis, were collected in the Royal Botanic Gardens, Kew, during the late Trusteeship of Sir William

Jackson Hooker. It was thus I planted the first Phoenix canariensis in the open in Australia. Near this group of Palms in the Garden Palace grounds is growing a fine specimen of Phoenix dactylifera which I planted. This specimen belonged to my collection (which had been awarded a gold medal) of the most valuable commercial plants ever exhibited in Australia.

The group of Palms which I planted some years ago in Hyde Park, Sydney, has recently been referred to in the leading Australian news papers as the principal feature of the Park. Fred Turner, Chatswood, Sydney.

NOTES ON CONIFERS.

XVI.—CUPRESSUS GLABRA.

ALTHOUGH this Cypress was first found on Pine Creek, Central Arizona, more than twenty years ago, it was not distinguished from its nearly allied, Cupressus arizonica, until 1910, when Professor Seward, of Washington, described it from a group of trees discovered by Mr. A. H. Zieher, on the northern slope of a small tributary stream on the west side of the Verde River Canyon, Arizona. The history of this new Cypress, given in considerable length by Seward in his recently published account of the Conifers and Juniper Trees of the Rocky Mountain Region. He notes that in general appearance the foliage of the smooth Cypress resembles that of the Arizona Cypress (Cupressus arizonica), Greenel, though the former species can be distinguished from the latter by the compact, narrowly oval, or somewhat pyramidal, crown. The branches of smooth Cypress, particularly of younger trees, are strongly upright. Old trees grown in the open develop long, lower branches, which from their great weight are less upright than those of trees of the same age in a close stand. In height, the trees range from 25 to 70 feet, and in diameter from 10 to 14 inches, though much larger trees probably exist. The most distinctive characteristic of this tree is its thin, smooth, dark, purple-red bark. Each season's growth of bark, from 1/10th to 1/8th of an inch thick, breaks irregularly into small, curled, scale-like plates, which fall away during the succeeding autumn and winter, leaving the trunk smooth. The foliage is a bright blue-green, and the minute, scale-like leaves are thickened and keeled on the back, where in practically every case there is a comparatively large resin gland, a characteristic which distinguishes the leaves from those of C. arizonica. The mature cones are conspicuously wrinkled, and covered with a deep, blue-grey bloom, which when rubbed off reveals a rich, dark brown colour beneath. They may remain on the tree unopened from 14 to 18 years.

Both species grow together in the mountains of Arizona, but Cupressus glabra is much more restricted in its range. In the Verde River Canyon it grows abundantly in gravelly and shelly soil, at elevations between 5,700 and 5,900 feet. At lower elevations it is associated with Pinus monophylla, Pinus edulis, Quercus chrysolepis, and Rhus haurina.

If the foliage character mentioned above is to be relied upon for distinguishing Cupressus glabra from C. arizonica, all the trees grown under the latter name in England, which I have examined, would seem to belong to C. glabra rather than C. arizonica, of which I have seen no typical example from an English garden. Most, if not all, our cultivated trees have conspicuously glandular foliage. In Messrs. Hillier's

Hybrids of Cattleya Bowringiana named by Mr. T. E. Meade Owen, Florida. In the composition of the names "Bow" represents C. Bowringiana and the other parts are made up of syllables of the parents. Episcattleya Adonis (C. Bowringiana x Epidendrum adonis), Episcattleya phloxica (C. Bowringiana x Epidendrum phloxica), Cattleya Annelora (C. Bowringiana x C. interlobosa), Cattleya Melodora (C. Bowringiana x C. labellata), Cattleya Estrella (C. Bowringiana x C. Duperreana), Episcattleya Beirna (C. Bowringiana x E. Peruvia), Cattleya Crisomulosa (C. Bowringiana x C. leucoglossa), Episcattleya Leobrocha (C. Bowringiana x E. C. Ives), Episcattleya Purpurea (C. Bowringiana x E. C. Ives).

* Shown by Messrs. Hassall and Co. as a yulidium hybrid.
* Cattleya-Corona previously recorded in Gardeners' Chronicle last.

* Garden and Forest, VIII, 22, 1895.
† American Forester, XVI, 88, 1910.
‡ U.S.A. Dept. Agric. Bull. 207, 1915.
§ Prof. Seward, however, stated in a letter to me a year ago that, judging from specimens received from Prof. A. Henry, the plant we have cultivated as Cupressus arizonica seemed to be quite different from C. glabra as known in America, but Henry is of the opinion that this specimen, which he thinks, came from Lough Cutra Castle, Ireland, comes under C. glabra. Moreover, he is not convinced that there are two distinct species of Cypress in Arizona.

nursery at Winchester I saw large numbers of young trees, grown as *C. arizonica*, but a specimen from one of those sent to Professor Sudworth last year was referred by him to *C. glabra*. A tree in Sir John Ross's collection at Rostrevor and three small, but well-grown examples in Mr. William Arkwright's

a tree of *Cupressus arizonica* will send me a specimen branch, as I am anxious to know if this species, as defined by Sudworth, is really in cultivation. Mr. Wallis's photograph represents a branch from a young tree in Hillier's nursery at Winchester, which bore cones in 1915. *J. Bruce Jackson.*

The Week's Work.

THE FLOWER GARDEN.

By W. J. CRISE, Gardener to Mrs. DEMPSTER, Keele Hall, Staffordshire.

PRUNING SHRUBS.—The severe weather has delayed all work outside, and now that the frost has broken, alterations or planting not finished in the autumn, and the pruning and regulating of evergreen shrubs must be concluded with as little delay as possible. The saw may be used freely on overcrowded specimens of Portugal Laurels, the common Laurel, Yew, and Holly. Do not use shears on the large-leaved varieties; the knife, or tree-pruner, is better.

HERBACEOUS PHLOXES.—Now is the time to plant new varieties of herbaceous Phlox and divide and replant old ones. The soil must be dug deeply and the manure well pushed down, in addition to putting some in the holes when planting. Plant 2 feet apart, with the crowns 3 inches below the surface, applying a light mulching of leaf-mould and manure in equal proportions. Old crowns 9 inches to 12 inches across may be cut into four parts or more with a long-bladed knife; the roots cling too firmly together to be separated by hand. Even small pieces should not be discarded, but planted in a well-prepared reserve bed; they will provide a succession of flowers at a later period. Should the stock be limited, propagation may be effected in spring by attaching small pieces about 3 inches in length and inserting them singly in small pots or in a frame, using a light, sandy compost.

HOLLYHOCKS.—Young plants in reserve quarters should be lifted and placed in their permanent positions directly the soil is in a friable condition. The Hollyhock is a strong, deep-rooting plant, and the soil should be well prepared previous to planting. Those, however, who have wintered their plants in pots in frames should be in no hurry to plant them out before the latter end of the month, as a return of the recent severe weather would certainly injure them.

SOWING FLOWER SEEDS.—If these are sown at intervals of a week or so it will allow time to deal with the young seedlings in rotation before they become drawn and weakly, a not infrequent occurrence where large quantities are required. Petunia, Aquilegia, Pansy, Ageratum, Nicotiana, Heliotrope, Polyanthus, Salvia, Pyrethrum (Golden Feather) and Salpiglossis should be sown now.

FRUITS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton, W.

FIGS IN POTS.—The earliest and by far the most reliable varieties of Figs are St. John's and Pinco de Mel. In pre-war times, when we forced them early, these were now resting, prior to the last swelling and ripening of the fruits. Trees that are now growing freely should be stopped at about the fourth leaf. Do not do the thinning too quickly, or remove many shoots at one time, but rather take off a few one day and a few another until it can be seen that the crop is a fairly safe one. These earliest trees in pots should be top-dressed. For this purpose we use a mixture of hop manure, manure from a spent Mushroom-bed, and turfy loam in about equal quantities. We form a ring around the top of the pot with some of the compost, the ring resting, so to speak, on the top of the pot rim. The roots will enter the fresh soil within ten days. Guard still against an excess of moisture, more especially from the syringe than the evaporating troughs.

CHERRIES IN POTS.—Cherries grown in pots are well worth an extra care bestowed upon them. They will remain in health and vigour

(Photograph by E. J. Wallis.)

FIG. 34.—BRANCH OF CUPRESSUS GLABRA WITH FEMALE CONES.

garden at Sutton Scarsdale, last summer, are the same thing. Several trees I have seen labelled *C. arizonica* have also the thin, smooth, dark purple-red bark, and the upright branches of *C. glabra*. I shall be glad if anyone possessing

Figured as *C. glabra* in *Gard. Chron.*, June 5, 1915.

A NEW HORTICULTURAL COLLEGE.—A women's horticultural college has just been established at Chester, for the purpose of providing students with a short course of training in the cultivation of vegetables and fruit. The college is under the control of a committee, of which the Duchess of Teck is chairman.

for an almost indefinite number of years. We have had some in pots for nearly twenty years; they are still thriving, and promise well for this spring. Before long they will be opening their earliest flowers, if fairly fine weather comes to their aid; the buds are even now swelling freely. The custom with us now is to syringe at least once every day, and twice in bright, sunny weather. So far, our Cherry house is closed at night, but we shall soon allow a little night ventilation both at the side and at the top, except in keen, frosty weather. This almost constant ventilation is congenial to the Cherry when in growth, and it strengthens the flower-buds. A fumigation will be given in about a week, to keep in check the insect pests to which the Cherry is liable. This fumigation will carry the plants safely over the setting period. No fire-heat is given when it can be avoided. A temperature of 40° is ample, and 45° when in flower. The best and earliest Cherry with us is Guigne d'Annonay; it is nearly ten days before Early Rivers, in the same house. This year we are a little late in starting into growth, but I estimate that we shall have ripe fruit by June 1 under fair conditions. We shall introduce a hive of bees when the trees are fairly well in flower. Do not let the trees get dry at the roots, but keep a constant watch upon them. On the other hand, avoid an excess of water. Whilst in flower keep a dry, buoyant atmosphere, mostly damping over the surface upon which the pots stand.

STRAWBERRIES IN POTS. In some instances the plants will be pushing up their flower-spikes. Where this is the case keep the pots as near to the glass as possible, and do not so syringe overhead as to encourage leaf growth at the expense of the flower. Do not over-water at the period of flowering. Pinch off any adventitious runners as soon as they appear, and place the plants so that the flower-spikes are facing the light. Introduce another batch into fruit so as to keep up the succession. Sometimes the first earlies fail, and care must be taken to avoid a break in the supply. See that the later plants do not get too dry if in a cold frame or pit. Look over the pots to see if the plants have been lifted or loosened by the late frost, and, if so, make them firm again in their pots. Sometimes the pots are cracked during a hard frost; these must be replaced at once.

THE KITCHEN GARDEN.

By J. DEXX, Foreman, Royal Gardens, Windsor.

SPRING CARBAGE. The recent severe weather has had a bad effect on plantations of young Cabbage, and it is to be feared that the season for cutting will be somewhat later than usual. In some cases it will be necessary to plant again as soon as suitable plants can be procured. Growers who have a stock of plants in reserve should fill in gaps at the earliest opportunity, after which the surface of the bed should be lightly broken up with a fork or other implement, at the same time working the soil lightly towards the stems of the plants as a protection from rough wind. Further assistance may be afforded by light applications of soot during the spring. A sowing of some quick-maturing variety should be made at once in order to prevent a break in the supply. Sow in gentle heat and grow the plants under glass until large enough to handle, when they must be gradually hardened and planted on a good, rich plot.

WINTER SPINACH. This crop should be given early attention, so that a supply of green leaves may be applied. Sow Summer Spinach as soon as decaying plants and foliage and hoe the surface of the bed as soon as dry enough in order to promote new growth. Light dressings of soot may be applied. Sow Summer Spinach as soon as possible, in case the earliest sowing has been injured by frost.

FORCING. The roots of Seakale, Asparagus and Rhubarb should be placed in gentle heat as it becomes necessary in order to maintain an unbroken supply, and all Seakale roots which are intended for forcing in pots or houses should be lifted and placed in very cool quarters until required. Seakale crowns for forcing in the open should have a few inches of sifted ashes placed

over them as a protection from light; if left unprotected until growth commences the colour of the produce will not be satisfactory. Seakale forced in the ground by means of pots and fermenting material is heavier and of better quality than that forced in strong heat, especially late in the season. If a piece of ground can be entirely devoted to it, this is the best means of furnishing late supplies. The fermenting material should be prepared for the purpose and placed round the pots in sufficient quantity to ensure perfect darkness. Enough warmth should be provided to promote steady growth.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcott, Eastwell Park, Kent.

EUPATORIUM.—Greenhouse species of Eupatorium, such as *E. Weinmannianum* and *E. riparium*, remain in flower for a long time, and are useful for supplying cut blooms in winter, and for conservatory decoration as flowering plants. When they are past their best, remove them from the flowering house, reserving only the cleanest and healthiest specimens for stock plants. Cut these over and place them in a frame, reducing the supply of water at the roots, but not completely drying them off. They will soon start again into growth, and, when the shoots are sufficiently strong, the cuttings should be taken for next season's batch of plants. The cuttings will strike readily in a propagating pit or warm frame, dibbled in pots of light sandy soil.

THE ROSE HOUSE.—Presuming that the Roses were pruned and cleaned and the house closed a few weeks ago, the temperature may now be slightly raised as the days lengthen and growth becomes active. Ventilate as soon as the temperature of the house rises above 55°, allowing it to run up 10° by sun-heat before increasing the air. Be very careful to avoid draughts of cold air on the young and tender shoots of forced Roses, or mildew will quickly appear, with all its attendant evils. Close the house fully only in the afternoon to conserve the sun-heat as much as possible. Fumigate at regular intervals to destroy green fly.

POT ROSES. Where no special Rose house exists pot Roses may be started in fruit-houses, such as Vineries and Peach-houses. The conditions in these houses, when closed for starting, suit the Roses admirably. Pinch the plants, clean the pots, and if necessary give a top dressing of rich loam before placing them inside. Give a good watering, which will suffice for some time. Spray the plants lightly on sunny days.

FUCHSIAS. Young plants struck last autumn and grown gently on in a warm house all the winter will now require a shift into larger pots. Use a compost consisting mainly of good turfy loam, with a moderate proportion of leaf soil or spent Mushroom bed manure and sand, and pot the plants firmly. Plants to be potted should have been watered the previous afternoon; they will then have drained well before being handled for potting. Never pot a plant when the ball is very dry. Avoid disturbing the roots of the young Fuchsias too much; stake if required, and return the plants to a light, warm house for the present. Old plants which have been wintered in a cool house should be pruned hard back and placed in a moderately warm house to start. When commencing to grow, turn them out of the pots, reduce the ball, and pot again into somewhat smaller pots. Cuttings taken off as soon as the shoots are sufficiently strong will make a good batch of plants for blooming in late summer and autumn. Standard Fuchsias are deservedly popular, and well-grown specimens are excellent subjects for grouping with dwarf plants in the conservatory or greenhouse. Plants last for years, and old standards should be pruned and started as recommended above. If young plants are to be grown on for standards this season they must be encouraged to grow quickly in a warm house, exposed to full light. All side-shoots should be removed as they appear until the desired height is attained. Pinch the top out then, and a break of 4 or 5 shoots will be obtained. These must be afterwards pinched regularly to ensure a well-shaped head.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVEY, Abbots Wood, Godalming, Surrey.

GOOSEBERRIES. Complete the pruning of bush and cordon trees as soon as practicable. If they have been damaged by birds during the late frosty weather leave a little more growth to ensure a crop. If large fruits be required the bushes must be well thinned and pruned back to two or three eyes, but if quantity is the main object do not prune so hard, but well thin the shoots and leave the remaining branches nearly the whole of their length. Some of the fruit can be gathered for bottling; bottled Gooseberries are a great acquisition when other fruits are scarce. They should be bottled whilst green and tender. The pruning of Gooseberries trained on wire and in cordon form should be severe. All shoots should be reduced to two or three buds except the terminal one, which should be left for extension, or, if the terminal shoots have reached the top of the allotted space, these also should be reduced to two eyes each. As soon as the pruning is finished and all the prunings cleared away some slaked lime should be sprinkled over the trees. If Lichen is present, spray with alkaline solution or with lime-water in which some petroleum has been mixed. If this is carefully strained the bucket pump syringe will do the work very effectively in a short time. It will, moreover, act as a deterrent to birds. When this has been done fork the soil lightly, and mulch with some good manure.

MORELLO CHERRIES and all trees on north walls should be pruned. The shoots should be tied or nailed quite straight, not too close together, as, unless plenty of room exists between the branches the fruit will be of poor quality, and the leaves will be more difficult to keep free of pests. All pruning should be finished as soon as possible, as the sap will soon be on the move.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

CYMBIDIUM INSIGNE. Since the introduction of *Cymbidium insigne* the decorative qualities of *Cymbidiums* have been greatly enhanced. Before *C. insigne* was brought into use by the hybridist the colouring of the flowers and the habit of the plants were not nearly so attractive. *C. Tracyanum*, a supposed natural hybrid, bore flowers of a dull brown colour; the colours of *C. Lowianum* ranged from greenish-yellow to brown; *C. chaboumii* had white, wax-like flowers with short inflorescences. But since the advent of *C. insigne* as a parent we find fine, rich colourings, varying from white and yellow to shades of the deepest pink, and the arching habit of the flower-spikes adds to the beauty of the plants. The season of flowering, late winter and early spring, also adds to the usefulness of the genus for decorative purposes. The hybrids are easily raised from seed, and have been known to develop flower spikes in four years after the sowing of the seed. Among the best of the known hybrids from *C. insigne* are *C. Gottianum*, *C. Alexandri*, *C. Cuninghameum*, *C. Pauwelsii*, and *C. Queen of Gattton*. Many of the hybrids mentioned are in bloom or are developing their flower-spikes, and will now require a liberal supply of water at the roots. When water and these plants soak the compost through, but allow it to become moderately dry between each application. *C. Tracyanum* will now be passing out of flower. This Orchid, like many other *Cymbidiums*, resents root disturbance, therefore, if there is sufficient room in the pot for the plant to complete its new growth it will be better to defer repotting for another season. Any plants that are to be repotted should receive attention at once, but do not give more pot-room than is absolutely necessary, as all *Cymbidiums* flower most freely when in a not-bad condition. Use a compost similar to that recommended for *Cypripediums* on page 72. All *Cymbidiums* succeed best when grown in a moist atmosphere, with a night temperature ranging from 52° to 55°, with a rise of 5° or 10° during the day. *Cymbidium grandiflorum* should occupy a position near the glass at the sunny end of the house, or it will fail to develop its flowers in a satisfactory manner.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher—Our correspondents would oblige us by obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary Department, and all plants to be named, should be directed to the EDITOR. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News—Correspondents will greatly oblige by sending to the Editors early intimation of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR MARCH.

TUESDAY, MARCH 13—
Roy. Hort. Soc. Coms. meet.

THURSDAY, MARCH 15—
Manchester and N. of England Orchid Soc. meet.

THURSDAY, MARCH 27—
Roy. Hort. Soc. Coms. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 36.6°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, March 5 (10.9 a.m.): Bar, 29.9°; temp 44°; Weather Clouds.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Herbaceous Plants, Fruit Trees, Rhododendrons, Roses and Bulbs, at 67 and 68, Cheapside, E.C., at 12 o'clock. Japanese Lilies in cases, at 3 o'clock, by Protheroe and Morris.

THURSDAY—

Roses, at 67 and 68, Cheapside, E.C., at 1 o'clock, by Protheroe and Morris.

Horticulture and the State

It looks as though the State coach had at last come to fetch the Cinderella of Horticulture from her modest abode, and although the fairy tale does not tell us how the maid belated in after life, we may be confident that Horticulture will prove worthy of the prominence into which it is now being brought. The duty of the gardening world at the present critical time is clear. Mere obstructive criticism is useless. Every pound of food that can be produced will be wanted, and therefore it is every gardener's plain duty to look upon himself as an unofficial officer enlisted in the service of the Director General of Food Production. Many of those who are cultivating ground are inexperienced. A little

friendly counsel will often go far to convert a prospective failure into a success. Gardeners can, from the store of their knowledge, give that counsel. In some places the ground is not very suitable for growing crops, but before discouraging the amateurs of the spade, let the gardener reflect that, even though a crop of Potatoes taken from such land be a very light one, yet unless the land is sour and absolutely infertile, late summer-sown crops—Turnips, Beets, and Brassicas—may in many cases be made to compensate for the lightness of the first crop. If every gardener makes himself into a discreet and persuasive missionary, and not only gives advice but offers practical help, he will be doing a national service. Furthermore, gardeners and owners of gardens must face the present position. Without sacrificing plants of real value and variety—for such a sacrifice would be an irreparable blow to horticulture—they should make up their minds that for the present luxury gardening should be reduced to the lowest limits. There is no reason why easily-grown annuals should not continue to be grown, nor why Rose beds should not be allowed to remain, but energy devoted to the frequent tending of lawns and paths, the raising of conservatory and other decorative plants, the early forcing of luxury fruits, ought not to divert any gardener from the urgent duty of raising vegetable food. The quantity of such food raised in gardens and never accounted for in the market returns is enormous, and can undoubtedly be increased. If in every district the gardeners will become members of the Royal Horticultural Society's Panel of Patriotic Gardeners, or put their leisure time at the disposal of local organisations engaged in encouraging food production, they will be at once discharging a duty and rendering a real service to the State.

Nor is it too much to hope that gardeners who can show that they are doing the maximum possible in the cultivation of food crops, and in helping their neighbours as well, will be recognised authoritatively as doing work of national importance.

THE ROYAL SOCIETY.—Among the names of biologists nominated by the council for election to the fellowship of the Royal Society, are those of Professor WEISS and Dr. E. J. RUSSELL. Professor WEISS, who occupies the chair of Botany in the University of Manchester, has made important contributions to the knowledge of fossil plants, and Dr. RUSSELL is well known not only for his remarkable work in soil sterilisation, but also as a most competent and energetic Director of the Rothamsted Experiment Station.

HORTICULTURE AND THE FOOD CRISIS.—On Tuesday last the Council of the Royal Horticultural Society agreed to release Dr. F. W. KEEBLE, F.R.S., for service with the new Director-General of Food Production, Sir ARTHUR LEE. Gardeners will learn with interest that a separate horticultural section is to be established under Dr. KEEBLE's direction, with a view to assisting the increase in the production of food in gardens and the

smaller uncultivated areas. The official address of Sir ARTHUR LEE's Department is 72, Victoria Street, Westminster.

PILFERING OF SEED POTATOS.—Purchasers of seed Potatoes are advised to inspect carefully consignments at the time of delivery. Judging from reports which we have received, pilfering during transit appears to be frequent. In a case which has come to our notice of three bags, two had been opened and some 20 lb. of seed abstracted.

THE SURVEYORS' INSTITUTION.—A meeting of the Surveyors' Institution will be held in the Lecture Hall of the Institution on Monday, the 12th inst., at 5 p.m., when the adjourned discussion on the paper on the "Defence of the Realm (Acquisition of Land) Act, 1916," read by Mr. EDWIN SAVILE (member of council) at the last meeting, on February 12, will be reopened by the Right Hon. the Lord PARMOOR OF FREITH, P.C., K.C.V.O., K.C.

SCHOOLBOYS IN AGRICULTURE.—We learn from our contemporary, the *Revue Horticole*, that the French Ministry of Agriculture has just formed a service, to be known as the Service of Schoolboy Labour. It has been created with a view to encouraging school children all over the country to render practical assistance to those engaged in vegetable culture. There seems every prospect of success in the appeal thus being made, and many growers will probably gladly avail themselves of the assistance of these young workers.

POTATO AND CEREAL CROPS.—The International Agricultural Institute estimates that the production of Potatoes for the current season in France, United Kingdom, Italy, Netherlands, Canada, United States and Japan is 564,219,000 cwt., or 21.4 per cent. below the average crop in the years 1909-1913. The Australian Wheat crop is 76,865,000 cwt., an increase of 58.5 per cent. on the average production in 1909-15. The areas sown with Wheat and Rye in France are 10,569,000 acres and 2,046,000 acres respectively. This estimates, compared with last year's averages, represent decreases of 15 per cent. in the case of Wheat and 10 per cent. in the case of Rye.

CULTURAL CONDITIONS FOR MEDICINAL HERBS.—A little while ago a British horticulturist of repute received a letter from a planter asking which artificial manures were best calculated to increase the yield of oils, aromatic oils, latex, resins, and such-like plant products. Needless to say, the person appealed to was unable to give the information. Beyond making the appropriate and inadequate general statements on the action of different kinds of manures on the several parts of plants, he was obliged to confess that neither he nor anyone else knew anything worth knowing on the best cultural conditions for producing these different plant products. The interest lies, therefore, in the question, and not in the answer, and anyone who is conversant with the great importance of drugs and other commercial products of plants cannot but realise how much to be desired is the knowledge of the conditions under which plants yield these products most lavishly. Among the not too numerous attempts made to arrive at this knowledge the most recent is that made by Mr. FRANK RABAK, with respect to the production of peppermint oil by *Mentha piperita*.^{*} The results of the experiments carried out by the author do not appear to be very decisive. He inclines to the belief that the oil is produced rather more copiously on light, sandy, or loamy soils, than on heavier soils, although he also makes the statement (p. 2, *op. cit.*) that only very slight differences are noted in the yield of oils obtained from plants grown in

* *The Effect of Cultural and Climatic Conditions on the Yield and Quality of Peppermint Oil.* Bull. 454, U.S.A. Dept. of Agric.

different soils. The yield from dried plant material is lower than that from fresh plants, and more oil occurs in the Mint during its fruiting state than in its budding or flowering state. It is the leaves which contain most of the oil, the stem containing but very little. Plants grown in partial shade, at all events in the author's experiments, yield as much oil as is obtained from plants grown in the sun. The chief conclusion to be drawn from this, as well as preceding investigations, is that a rich and promising field awaits exploration. At present our ignorance in these matters is very great, but having regard to the vast commercial importance of many of the therapeutic and industrially-used plant products, there is no reason why in course of time knowledge should not replace that of ignorance.

WAR-GARDENING AT HARROW.—Harrow-on-the-Hill, Middlesex, was one of the first places in which war gardening was taken up on a large scale. Ever since the outbreak of war, the municipality, and especially Councillor JAMES O'BRIEN, the vice-chairman, has devoted much time and energy to the production of food, chiefly from waste land. The Council has provided land for about 600 allotments. The experiment has been begun of keeping pigs on the Council's Sewage Farm, and many large breeding sows have been purchased. Householders are keeping edible refuse separate from other refuse; this has been used for feeding the pigs, which have so far cost nothing to keep.

WAR ITEMS.—We learn from our contemporary *Le Jardin* that Monsieur ALFRED NOMBLOT, the Secretary of the Société Nationale d'Horticulture de France, now serving in the Army, has been favourably mentioned for the second time in despatches. His rank is that of "chef de bataillon," and the despatch states that he "has fulfilled every mission entrusted to him with remarkable zeal and capability. Thanks to his clear-sighted energy and his infectious enterprise, he has obtained from his battalion the maximum of service, even in the most dangerous conditions."

— From the same source we learn that the Company commanded by Monsieur CHARLES DUGOY, a former contributor to these pages, has received the following encomium: "The 5th Company of the 14th Infantry Regiment, on July 11, 1916, displayed great gallantry on open ground, and succeeded, in spite of heavy mitral-leuse fire, in reinforcing the first line, which was in danger. On the following day, placed at the extreme left of the same line, the company heroically resisted a strong attack, maintained its position, and took a number of prisoners." Monsieur Dugoy, already Chevalier de la Légion d'Honneur, has now been awarded the Croix de Ste. Anne de Russie.

— Among the French prisoners of war recently returned from Germany, we notice that the son of M. PIERRE PASSY, the eminent pomologist and lecturer at the Grignon School, is one of the number.

Le Jardin, in giving a further list of killed and missing Old Students of the Versailles School of Horticulture, points out that it brings the number up to 75 out of 459 who joined over 16 per cent.

The Edinburgh Market Gardeners' Association has decided to reserve 10 per cent. of their produce for the Army. This is in accordance with a proposal of the military authorities, which has met with a favourable response from market gardeners and farmers in other parts of Scotland.

NEW ZEALAND FLORA.—Volume XLVIII, of the *Transactions and Proceedings of the New Zealand Institute* for the year 1915, issued in October, 1916, contains a number of interesting botanical papers, some of which have already

been summarised in these pages. It is a volume of some 600 pages, illustrated by twenty-nine plates, of which eleven represent local botanical subjects. A considerable number of new species are described, mostly belonging to the larger genera, such as *Epilobium*, *Veronica*, *Amplylla* and *Celmisia*. The Kermadec Islands Palm is described as a species distinct from

other features of the great natural Show, exhibited at the Colonial and India Exhibition at Kensington in 1906, was sold at very moderate prices before news of the colossal disaster reached this country. This volume of the *Transactions* also contains several noteworthy biological papers by Dr. L. COCKayne, and some "Observations on the Lianas of the Ancient Forests of

[Photograph by C. W. Cole.]

FIG. 35. CYMBIDIUM INSIGNE ALBUM
(See Awards by the Orchid Committee, p. 87.)

the Norfolk Island *Rhopalostylis Baueri*, and named *R. Cheesemani*, Beccari. An instructive description of the vegetation of the Tararua Mountains, the scene of the great volcanic eruption on June 10, 1886, by B. C. ASHON, is illustrated by eight characteristic landscape views. In this connection it may be mentioned that a collection of paintings of the pink terraces and

the Canterbury Plains of New Zealand," by J. W. BIRD. The locality in which the investigations were made was Hecaraton Bush, the last remnant of the ancient forests of the Canterbury Plains now strictly preserved, the bulk of which consists of *Podocarpus dactyloides*, many of gigantic dimensions, with a sprinkling of *P. spiratus* and *P.*

Totara and two species of *Elaeocarpus*. The vegetation of the forest comprises sixty-eight species of vascular plants, consisting of 35 species of trees and shrubs; 12 lianes; 2 parasitic; 12 herbaceous plants and 7 Ferns. The intermingled stems of the various lianes often form impenetrable masses, very different from anything we see in our native forests. It is computed that New Zealand contains no fewer than forty-seven species of liane, belonging to twenty-two genera and sixteen families.

THE LOCAL SOCIETIES.—On February 15, the Newcastle and District Horticultural Society held a public meeting, addressed by Mr. T. A. LAWRENSON, on the subject of home food culture. The lecture chiefly consisted of advice to those cultivating allotments, and the lecturer urged the members of the society to assist those engaged for the first time in vegetable growing by giving them practical help and counsel.

PUBLICATIONS RECEIVED.—*Hints on Potato Growing.* By A. J. Allsop, Superintendent of the Leeds City Parks. (Published by the Round-hay Allotments Association.)—*The Ceylon Agricultural Society's Year Book, 1917-1918.* By C. Drieberg. (Colombo: The Colombo Apoth. Co., Ltd.)—*Journal of the R.H.S. Gardens Club, No. IX., 1916.* (Colchester: Benham & Co., Ltd.)—*Journal of the Kew Guild, Vol. III., No. XXIV.* (London: Taylor and Francis, Red Lion Court.)—University of California publications: Bulletin No. 270, *A Comparison of Annual Cropping, Biennial Cropping, and Green Manures on the Yield of Wheat;* Bulletin No. 272, *Commercial Fertilisers.*—*Transactions of the Royal Scottish Arboricultural Society, Vol. XXXI., Part 1.* (Edinburgh: Douglas and Foulis, Castle Street.)—*Notes on Medicinal Plants.* By A. Hosking. Bulletin No. 78, The West of Scotland Agricultural Society. (Glasgow: Robert Anderson, 142, West Nile Street.)—*Notes from the Royal Botanic Garden, Edinburgh.* Nos. XLII., XLIII., XLIV., XLV. (Edinburgh: Neil & Co., 212, Causewayside.)—*Reports on Crops, Live Stock, &c.* Crop Bulletin No. 94, Department of Agriculture and Immigration, Manitoba.

NOTICES OF BOOKS.

FIELD NOTES ON SWEET PEAS.*

VERY many Sweet Pea enthusiasts will remember the visit paid by Mr. Lester L. Morse, of San Francisco, to the National Sweet Pea Society's great exhibition of 1912, and the surprise he showed at the wonderful flowers staged in the Royal Horticultural Hall by the most skilful of British growers. Some will also remember the good-humoured chaff Mr. Morse received concerning a certain "Bible," which humour said never left him either by day or night. It was a volume of notes on Sweet Peas, culled from all sources. These notes, and a vast amount of industry on the part of Mr. Frank Cuthbertson (now the supervisor of the Sweet Pea work carried on at Messrs. C. C. Morse and Co.'s seed farms in California), have been joined to produce a book of surpassing interest to Sweet Pea lovers all over the world.

The classes or types of Sweet Peas are reviewed, and then follows a brief historical sketch of each section. Here the notes on Early-Flowering Sweet Peas become particularly fresh and interesting. Unknown amateurs have not seldom been the means of enriching our gardens, and so, in this case, it appears that the variety *Blanche Ferry* was found in the garden of a quarryman's wife in northern New York, where the good lady had practised careful selection for many years. Mr. Tracy discovered the variety in its humble home, and Messrs. D. M. Ferry and Co. introduced it in 1889.

* *Field Notes on Sweet Peas.* By Lester L. Morse and Frank G. Cuthbertson. (Published by C. C. Morse & Co., San Francisco, Cal., U.S.A., 1917.) \$1.50.

The "cordon system" of cultivating Sweet Peas for exhibition purposes is dealt with at some length, and this chapter is peculiarly interesting to British cultivators, as it records the excellent results obtained by the Messrs. Morse in the grounds of the Panama-Pacific International Exposition of 1915. Capital hints regarding the packing of Sweet Pea flowers and their arrangement at an exhibition are given, and Mr. G. W. Kerr (who, like Mr. F. Cuthbertson, was trained in this country, and was a pupil of Mr. Andrew Ireland), gives a brief note on the general cultivation of the Queen of Annuals.

To me, however, the most valuable part of the book is the list of names of Sweet Peas, with descriptions. This list contains the names of 1,638 Spencer and grandiflora varieties, 201 early-flowering varieties, and 29 Cupid varieties. Having had a good deal to do with the production of the National Sweet Pea Society's lists of names, as well as the compilation of the Royal Horticultural Society's lists of Daffodil names, I am perhaps able to appreciate the labour Mr. Cuthbertson has put into this new list, which is certainly the last word on the matter up to the end of the year 1916. "To get the list together and alphabetise it has meant much labour, but I trust it may prove of interest if not of value to those associated with the Sweet Pea," is the compiler's modest observation. It is a splendid work, and as Spencers are differentiated from Grandifloras, date of introduction and name of introducer given, and the varieties considered to be obsolete distinctly marked, the list should prove invaluable alike to growers and seedsmen, who may add their own notes on the alternate blank pages and so keep the list up to date.

The illustrations showing the various types and forms are good, but the one intended to indicate the "infallible distinction between ordinary or Grandiflora Sweet Peas and new Spencers" is poor, and has apparently suffered greatly in the process of reproduction. But, anyway, the 220 large octavo pages of "Field Notes" are cheap at a dollar and a half, both for their general interest and value to the specialist. One could wish that there were such valuable lists of other florists' flowers. C. H. Curtis.

AMERICAN NOTE.

THE AMERICAN GREY SQUIRREL.

THE note in *Gard. Chron.*, vol. LIX., p. 224, on the grey squirrel, which has been acclimated in Great Britain, interested me. The animal is pretty and interesting, or what Americans term "cute," but after an acquaintanceship with it of over 25 years I have failed to find that it is of any economic value, while it has many bad traits.

It digs up and destroys bulbs, having a special fondness for Crocuses; it is also particularly destructive amongst Pears and our popular vegetable Sweet Corn. A few squirrels will soon ruin a large corn patch unless effective measures are taken against them. These squirrels make nesting places in the attics of houses, in barns and other outbuildings, shingles and cupboards being easily burrowed through. In spring, while the young growths on Elms and other trees are young and tender, the squirrels simply riddle them, cutting them off in squares, so that the ground is perfectly covered with them.

While the foregoing are serious faults, the most serious one is that these squirrels, or as they would be better termed, "tree rats," destroy immense numbers of young birds; this last offence to me is quite unpardonable, for here in New England the birds are of supreme economic value in helping to hold in check hordes of destructive insects. We are told

that squirrels have an economic value in that they help to disseminate nuts and seeds, but I consider the good they do is but the veriest fraction of the harm done to birds, buildings and crops, and I sincerely hope that this pretty, interesting, but destructive pest will not be allowed to spread in Great Britain.

GARDENERS IN AMERICA.

AS no young gardeners have come to America since the European war opened, there is a marked scarcity of assistant gardeners, more particularly those accustomed to greenhouse work. The same is true of garden labourers, many of whom have gone into occupations which are more remunerative, in spite of the advance in gardening wages. Of head gardeners there is no shortage at any time, owing to the fact that young men coming here feel that after one or two years in the New World they are fully competent to take charge of any garden. Not only is labour dear, but fuel and all kinds of supplies have advanced in price tremendously, in some cases more than in Great Britain. Cut flowers have sold particularly well during the present winter, prices averaging better than a year ago. Vegetable prices have never been equalled in my experience. Of the more common varieties, Potatoes are retailing at 11/12s. per bushel; Cabbages, 5d. per lb.; Onions, 4d. 7d. per lb.; Carrots, Turnips, Beets and Parsnips, 2s. 3d. per lb. *William N. Craig, Faulkner Farm, Brookline, Mass., U.S.A., January 31.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE VALUE OF LEES. I was glad to see the timely advice of Mr. Edwin Beckett (see p. 59) to grow more Lees. I have repeatedly pointed out the great value of the Leek and urged its more extensive culture in southern parts of England. Here, in France, it is grown extensively in every garden. My ignorance of the French language has prevented me from ascertaining the methods of culture, but appearances point to their being sown in drills, like Onions, and thinned, for they are usually 4 to 6 inches apart in rows 1 foot asunder. The plants are quite small even now, and presumably they are pulled and used for soups. In only a few cases have I seen any attempt to earth them up. I am not here advocating the French method of culture, but put my observations on record to show that our French friends highly value the Leek as an article of food. I get the *Gardeners' Chronicle* regularly and read it with eager interest. W. F. Rowles, British Expeditionary Force, France.

UNDER-CROPPING IN ORCHARDS.—Much more might be done to economise in land by under-cropping orchards with vegetables. I have in mind several sparsely planted orchards which have been laid down to grass, presumably to save labour. It would have been better for the trees if the ground had been planted with vegetables. Luxuriant grass, in an orchard where the trees are all standards, may be comparatively harmless, and the grass valuable for feeding purposes or for hay; but where the trees are a mixture of standards and bushes, under-cultivation is a more economical method of producing a double crop. The mowing of the vegetable crops tends to produce freedom of growth in the fruit trees. E. Molyneux, Swanmore Farm, Bishop's Waltham.

GALANTHUS IMPERATI ATKINSHII.—Atkins Snowdrop is one of the most beautiful varieties of this popular flower. This year, like all other Snowdrops, it is much later than usual. It came originally from the garden of the late Mr. Atkins, of Painswick. Another fine Snowdrop was later sent out under the name of *Atkinsii* in error. This one is tall, and is subject to a curious petaloid malformation, apparently a tendency towards doubleness, as an additional petal

or two are produced. When the flowers are fully open they thus present a singular appearance. Although this "pseudo-Atkinsii" is worth a place in the garden, the true *G. Atkinsii* far excels it in beauty of form and general appearance. The stems are tall and stout, the flowers perfect in form and of great purity, and the green markings are without a flaw. It is not at all common, either in private gardens or nurseries. It is different from *G. Melvillei*, also ascribed to *G. Imperati*, which is, in itself, only the southern form of *G. nivalis*. I have never seen finer flowers of *G. Atkinsii* than some sent me by Mr. E. A. Bowles, of Myddelton House, Waltham Cross, N. *Arnott, Moorwelltown, Dumfriesshire.*

THE WHITE WOOD STRAWBERRY (see p. 88.)—The following quotation from the *Fruit Cultivator*, by John Rogers, 1837, gives the information required by *A. N.*:—"This (the Red Wood) and its congener the White Wood (the later but an indifferent bearer) are natives of this country, and sometimes introduced into gardens by those who relish their sweet, tartish taste. These sorts are readily raised from seeds sowed as soon as ripe, and cleared of pulp, and in the following spring the seedlings may be hedged out where they are to stand for good." *Fredd, Bostock, Springfield, Cliftonville, Northampton.*

—The Wood Strawberry referred to by *A. N.* is the white form of *Fragaria vesca*. It was very popular in the early days of last century, and is referred to by Abercrombie and other authors of that period. The flavour of the berries is excellent, and a handful of the fruits added to ordinary Strawberries in jam making will noticeably improve the flavour. I shall be pleased, in honour of the Immortal Jone, to send a few plants later to *A. N.* *E. A. Bangard.*

PRUNING FRUIT TREES IN FROSTY WEATHER (see pp. 57 and 59).—These are some statements which are handed down from generation to generation, or which are copied from one author by another, the authority for which is lost in obscurity; there are others in which "the wish is father to the thought." May it not be possible that the question of pruning in frosty weather is one in which the comfort of the operator is more considered than the ill effect upon the trees? No one would choose to go pruning in a blizzard, but on a quiet, frosty day a man can prune in comfort, provided he is warmly clad. Again, one would not think of pruning Peaches, Apricots or Cherries in severe weather, but Apples and Pears may be pruned with all safety. Some draw the line at Plums, but we have been pruning young trees, standards, bushes and fan-trained, for the past month with 20° to 25° of frost at night, and freezing slightly during most of the day. I remember that during a very severe winter in the eighties, when our kaffee men were all under cover, the foreman, who had charge of the trained trees, and who disliked being shut up in a close and over heated building, wrapped his feet up in bags over his boots and sallied forth into deep snow. For a week or two he cut down young trees and pruned trained trees. It was said that the results would be disastrous and plainly seen. The latter was the only true forecast, for the trees cut down during the frost made an early start in the spring, and were plainly superior to those cut down later. In fairness it should be added that after a long frost, work being hindered, the execution of orders is delayed, and the pruning of trees left is somewhat later than is desirable; still, since the experiment above mentioned we have never hesitated to prune during frosty weather, if agreeable to the pruners, and like *Southern Grapes*, have seen no bad effects. *A. H. Pearson, Loughboro.*

REGISTRATION OF BUSINESS NAMES.—May I seek the hospitality of your columns for the purpose of calling attention to the obligation imposed by the Registration of Business Names Act on shopkeepers and other tradesmen, and, in fact, on everyone carrying on a business or profession in this country (except limited liability companies and other corporations). This Act provides that on and after March 21 next, all persons carrying on business in this country must trade under their own true names or else must be registered. The object of the Act

is to enable everyone to know with whom they are trading, and if persons are trading under their own names with no additions except their Christian name or names (or the initials thereof) it is not necessary to register, but if anything is added to the true name, or if a business is carried on under a fancy title, registration must be effected between February 21 and March 21, on pain of heavy penalties. A simple instance will serve to show what is required. If, for instance, John Smith owns a business, he may trade as "John Smith," or "J. Smith," and need not register; but if he trades as "Smith and Co.," or adopts a fancy title, such as "The General Drapery Stores," registration must be effected. And, in addition to registration, all business letters, trade catalogues, trade circulars and showcards which are issued or sent to any person in any part of His Majesty's Dominions must show in legible characters the true name or names of the proprietors of the business, and the present nationality or the nationality of origin, if other than British.

The individuals and business firms who are not trading under their own name or names (with no additions thereto) are liable, if not registered by March 21 next, to a penalty up to £5 per day for every day of the offence, or if such individual or firm enters into a contract with a registered party, such contract cannot be enforced by the law if the other party should wish to get out of it. It is also open to any private individual to set the law in motion against a defaulter, except in regard to section 18 (publication in trade catalogues, etc.) where the consent of the Board of Trade must be obtained. It is understood that the forms for registration will be obtainable on and after February 21, from the principal post offices and the offices of the Registrar for England and Wales, and at 79, Russell Square, W.C. *James Martin, Chairman of the Parliamentary and Commercial Law Committee, London Chamber of Commerce.*

SOCIETIES.

ROYAL HORTICULTURAL

FEBRUARY 27.—The usual fortnightly meeting of the Royal Horticultural Society was held on Tuesday last in the Dipl. Hall of the London Scottish, Buckingham Gate. There was a slight increase in the number of exhibits compared with those of the two previous shows, but they were not sufficient to fill the hall. In the floral section, Perpetual-flowering Carnations formed the chief exhibits. There were also a few Cyclamen, a good group of Ferns, and some early-flowering Alpines.

The Floral Committee recommended an Award of Merit to a new variety of Cyclamen, and seven Medals to groups.

The Orchid Committee awarded one First-class Certificate, three Awards of Merit, a Preliminary Commendation, and two Medals to groups.

The Narcissus Committee awarded a Silver Banksian Medal to an exhibit of Daffodils.

The only group before the Fruit and Vegetable Committee consisted of seven varieties of Savoy from the Society's trials at Wisley, being those which showed least injury from the recent severe frosts.

Floral Committee.

Present: Mr. H. B. May (chairman), and Messrs. G. Harrow, G. Reuther, J. Green, J. W. Moorman, J. Neal, W. Howe, R. W. Wallace, C. Elliott, C. R. Fielder, J. Jennings, A. Turner, J. Dickson, C. Dixon, T. Stevenson, H. Cowley, C. E. Pearson, W. P. Thomson, and E. H. Jenkins.

AWARD OF MERIT.

Cyclamen Cherry Rippe.—The merit of this new variety lies not in the size of the blooms, which are not very large, but in the brilliant colouring, a glowing carmine, resembling the tone combined carmine No. 3 in the *Répertoire des Couleurs*. The plant forms a small, compact specimen, and the leaves are pleasingly but not conspicuously

marbled. It is very floriferous, and makes a handsome subject for indoor decoration. *From Messrs. STEVART LOW AND CO.*

GRASSES.

The following medals were awarded for collections:—

Silver Flora Medals to Messrs. H. B. MAY AND SONS, The Nurseries, Edmonstone, for FERNS, Cyclamens, Blue-flowered Cyclamens, and the handsome scarlet *Colymbia magnifica*. The latter plant was used as a cutting piece, and the front was furnished with a semi-circular row of *Richardias*, overhung by plants of *Lomaria gibba*, a small tree-Fern; and Messrs. ALWOOD BROS., Wivelsfield, Haywards Heath, for Perpetual-flowering Carnations.

Bronze Flora Medals to Messrs. J. CHEAL AND SONS, Crawley, for boxes of coloured FERMOSES, not plants of *Rhododendron Jacksoni*, and *R. praeox* (the former being particularly well-flowered), and specimens of choice and rare Conifers; Mr. J. C. JENNET, Rayleigh, for Perpetual-flowering Carnations.

Silver Banksian Medal to Messrs. STEVART LOW AND CO., Bush Hill Park, Enfield, for a group of Perpetual-flowering Carnations, and one of well-flowered Cyclamens, including a number of the new variety *Cherry Rippe*.

Bronze Banksian Medals to Messrs. H. J. CHAPMAN, LTD., Ryde, for a group of their beautiful Iris Cantab, with flowers of lavender blue; seedlings of *Cyclamen ibernicum*, including some with crimson flowers; a number of hybrid Freesias, and Daffodils in pots; the Misses ALLEN BROWN, Henfield, Sussex, for Violets of the Princess of Wales variety.

Other exhibitors were Mr. G. REUTHE, Keston, Kent, who showed Alpines and flowering shrubs, including *Hamamelis arborea* and *H. japonica var. macrantha*, which has broader but paler yellow flowers than *H. arborea*; Mr. G. W. MILLER, Wisbech, who showed spring bulbous plants; and Mr. C. ELLIOTT, Stevenage, who showed a batch of *Saxifraga Bursiferiana*, plants of which in small pots were flowering freely.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Messrs. Jas. O'Brien (hon. secretary), W. Bolton, S. W. Flory, Arthur Dye, W. H. Hatcher, T. Armstrong, Frederick J. Hanbury, F. R. Ashton, R. A. Bolte, and R. Brooman-White.

AWARDS

FIRST CLASS CERTIFICATE.

Elaphoglossa Bolleei (Elisabethae s. Prostrata), from Messrs. CHURLESWORTH AND CO., Haywards Heath. This is one of the most remarkable hybrids of recent times, and intermediate between the white *E. Elisabethae* which was the seed-bearing parent, and the rosy mauve *E. Pedersiana*, whose colour predominates in the new hybrid. We are informed that the time from the fertilization of the flower to the development of the true capsule and the germination of the seeds was three months, which probably constitutes a record. The stout inflorescence is 3 feet high, dark in colour after the female parent, and it bore 12 flowers, each more than 3 inches across and wax like in texture, and four buds. The sepals and petals are of deep rosy mauve; the lip is white with a yellow crest and narrow tinted apex. In its seedling habit and nearly erect inflorescence the plant resembles *E. Pedersiana*.

AWARDS OF MERIT.

Miltonia Veans (vesicularis s. Phalaenopsis), from Messrs. CHURLESWORTH AND CO., Haywards Heath. *M. vesicularis* was the seed bearer, and the pretty new hybrid approaches that species in habit and the manner in which the rose-tinted sepals and petals are displayed. The lip individual *M. Phalaenopsis* very strongly. The base is yellow, with rayed-crimson lines extending to the mid-vein spotting with which its white front-lab is decorated.

Cymbidium insipide album (see fig. 35), from Messrs. ARMSTRONG AND BROWN, Orghidhurst, Timberidge Wells. Of the large numbers of *C. insipide* imported, this is the first albino submitted before the R. H. S. Committee for award. Its value as a white-flowered Orchid in the hands of the hybridiser can scarcely be over-estimated.

The spike bore 11 white flowers, of fine form and substance, and without any sign of the vinous-purple lines and spots on the petals and lip, as in the many forms of the species which have already appeared.

Odontioda Joan Broadlands variety (Oda, Charlesworthii × Oda, aristosissima), from E. R. ASHWORTH, Esq., Broadlands, Camden Park, Tunbridge Wells. A handsome flower, and the darkest variety of the cross. The sepals and petals are deep claret-red, with a chocolate tint. The lip is mottled and flushed with ruby-red, lightest in front. The crest is yellow.

PRELIMINARY COMMENTARY.

Odontioda Madeline var. Opal (Oda, Charlesworthii × Oda, crispum), from Messrs. ARMSTRONG and BROWN, Tunbridge Wells. A richly coloured hybrid, of fine size and shape, flowering for the first time. The sepals and petals are glowing mulcharet colour, with a slight gold shade. The lip is blotched with deep rosy-mauve colour.

GENERAL EXHIBITS.

MESSRS. CHARLESWORTH and Co. were awarded a Silver Flora Medal for a fine group, consisting principally of red *Odontiodas* and purple and white *Odontoglossums*. Specially noteworthy were a handsome blotched *Odontoglossum crispum*, a magnificent *O. Aglaon*, the new *O. Nortia* (Jasper × Phoebe), finely blotched, a fine form of *Odontioda Sensation* (*Oda, Vuylstekeana × Oda, crispum*), good white *Cattleya Enid* alba, and a fine form of *Brasso-Cattleya Cliftonii*.

MESSRS. SANDER and SOXS, St. Albans, were awarded a Silver Banksian Medal for a group of *Cymbidium* Pauwelsii, *C. Gottianum*, *C. Albanense*, varieties of *Miltonia Bleuana*, a selection of pretty species, the new hybrid *Laelio-Cattleya Serr* (*L.C. bleibeiensis × C. Percivaliana*), with pale rose-coloured sepals and petals tinged with yellow and deep purple line; and *Brasso-Cattleya Andre Maron* var. *amabilis* (*B.C. Mrs. J. Leemann × C. Schroderae*) of good shape and delicate colour.

MESSRS. ARMSTRONG and BROWN, Orchardhurst, Tunbridge Wells, showed a good selection of new *Odontoglossums* and *Odontiodas*, the best of which were *Odontioda Armstrongii* var. *Jupiter* (*Oda, Vuylstekeana × Oda Armstrongii*), a charming flower of a deep reddish-rose tint, with white tip to the labellum and slight white margin to the other segments; *Odontoglossum eximilis* finely blotched, the new *Sophro-Laelio-Cattleya Iris* (*L.C. Thymoe × S.C. Doris*), a pretty flower, shaped like *Cattleya Percivaliana*, with light cowslip-yellow sepals and petals and soft rose-magenta lip with yellow lines running from the base; *Sophro-Cattleya Atrens gloriosa* (*C. Lawrenceana × S. grandiflora*), a profuse flower, and differing from the ordinary mauve-coloured forms in having the sepals and petals deep scarlet; and *Cattleya Ochoa magnifica* (*Trianae × Enid*), large, and of fine shape and colour.

MESSRS. FLORY and BLACK, Orchid Nursery, Slough, showed *Cattleya Blackii* alba (*Mendeli alba × Geskeiana alba*), a fine white flower, nearest in form to *C. Mendeli alba*, and the new *Brasso-Laelio-Cattleya Harrisonii* (*L.C. Juno × B.C. Mrs. J. Leemann*), a very interesting and pretty rose-tinted cross, in which *L. majulis*, obtained through *L.C. Juno*, shows plainly in the broad, flatly-displayed lip.

MESSRS. STUART LOW and Co., Jarvisbrook, Sussex, sent *Brasso-Cattleya speciosa* (*B.C. Digbyana-Mendeli × C. Schroderae*), bluish white, with yellow disc to the lip; a good *B.C. Mendel*, and *Laelio-Cattleya Galabina* (*L.C. Myra × C. Schroderae*), a pretty primrose-coloured flower, with orange-coloured disc to the lip.

Narcissus Committee.

Present: Messrs. E. A. Bowles, chairman, Miss E. Willmot, Messrs. W. Pompat, James Hanson, F. H. Chapman, C. Boume, P. E. Bull, G. Heath, and C. H. Curtis.

The only award made by this Committee was a Silver Banksian Medal, for boxes of *Dafnodi* shown by Messrs. R. H. BATH, LTD., Wisbech.

The varieties included Sir Watkin, Golden Sun, Victoria, and *Narcissus odorus unguisus* fl. pl.

Fruit and Vegetable Committee.

Present: Messrs. J. Creal (vice-chairman), W. Wilks, E. A. Buryard, A. Bullock, J. G. Weston, A. R. Allan, J. C. Allgrove, P. D. Tuckett, A. W. Metcalfe, W. H. DIVERS, E. Beckett, W. Bates, Owen Thomas, and W. Pompat.

The following were the varieties of Savoy exhibited from the Society's gardens: Ormskirk (Hawthorn Selection), Ormskirk Late Green (R. Sydenham, Ltd.), Late Drumhead (W. and J. Nutting), Selected Green Curled (Dobbie and Co.), and New Year (Sutton and Sons).

NORFOLK AND NORWICH HORTICULTURAL.

FEBRUARY 10.—The annual meeting of the Norfolk and Norwich Horticultural Society was held at the Guildhall, Norwich, the Lord Mayor (Mr. G. M. Chamberlin) presiding.

The statement of accounts showed a balance of £130 9s. 11d.

Mr. J. E. P. Pollard, the acting hon. secretary, read the annual report. The number of members was 204. The report referred to the establishment of a herb-growing association, and recommended that the expenses of the preliminary meeting and of the initial propaganda work in connection with the herb movement in the county should be borne by the society. Since September 26 the association had been quite distinct from the society, and now had a council, executive committee, and offices of its own. The committee recommended that the society should suspend its exhibitions during 1917, and that its president, vice president, committee, and officers should continue in office for the year. The attention of members was drawn to the appeal made through the Press and elsewhere by Lord Beresford, president of the Vegetable Products Committee, for gifts of fresh fruit, vegetables, jams, and preserved fruits throughout the winter months. A local committee had been formed in Norwich for receiving and collecting goods. The report was adopted.

On the proposition of the Sheriff (Mr. G. Ernest White), it was decided to make a grant of £10 to the Norwich Food Production League.

LINNEAN.

The general monthly meeting of this Society was held on February 1, 1917, Sir David Prain in the chair.

Mr. C. E. Salmon made a communication on "Some Plants that might occur in Britain," showing specimens of the plants considered likely to occur, and their allied forms possibly to be mistaken for them. Some undoubtedly native species would seem unlikely from their European distribution to occur here, such as *Sagina Reuteri* and *Lloydia alpina*, whilst it is manifestly uncertain what species may be ultimately found in Britain. He had therefore chosen the ten following species, all well-defined plants, and recognised on the Continent, leaving out consideration of minor species for the present.

Ranunculus oleraceus, Lloyd, allied to *R. tripartitus*, DC.; *Cerastium brachypetalum*, Desp., close to *C. glomeratum*, Thunb., especially its subvariety *elongatum*; *Alisma dimensis*, Garbice, distinguishable from *A. tenuifolia*, Crantz; *Spergularia Maritima*, Boreau, closely allied to *S. pentandra*, Lam., found in Ireland by Dr. William Sherard, and recorded in Ray's "Synopsis," ed. 3, p. 351; *Veronica opaca*, Fries, very near *V. agrestis*, Linn., and *V. polita*, Fries; *Rhinanthus hirsutus*, Lam., comparable with our *R. major*, Ehrh.; *Ruppia brachypus*, Gay, very near *R. rostellata*, Koch; *Helocharis mamillatus*, Lindb. f., between *H. palustris*, R. Br., and *H. unguiculus*, Schultes, distinguished by their fruits, as shown in the diagram exhibited by the author; *Carex frigida*, All., previously reported from Scotland, but the plant found is now known as *C. binervis* var. *Sodderi*, Linton; and lastly, *C. laevirostris*, Fries, nearest to *C. rostrata* of our British species.

The last communication was by Messrs. Charlesworth and J. Bamsbottom, "On the Structure of the Leaves of Hybrid Orchids."

Mr. R. A. Rolfe, A.L.S., contributed further remarks, and showed leaves of Orchids in illustration.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

FEBRUARY 15.—Committee present: The Rev. J. Crombeshelm (in the chair), Messrs. R. Ashworth, D. A. Cowan, Dr. Craven Moore, J. Cypher, A. G. Ellwood, J. Evans, P. Foster, A. H. Headley, A. J. Keeling, D. McLeod, W. Shackleton, H. Thorp, and H. Arthur (secretary).

GROUPS.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Davenport), was awarded a Large Silver Medal for a group of *Odontoglossums*, *Odontiodas*, *Cattleyas*, *Brasso-Cattleyas* and other plants.

MESSRS. CYPER and SOXS, Cheltenham, were awarded a Silver Medal for *Cypripediums*, *Laelia anceps* Hillii, *Calanthe Pycnan*, C. Wm. Murray, *Mastodella gurganua*, a fine variety of *Cymbidium Wiganianum*, and *Coelogyne intermedia*.

Other exhibitors were Messrs. GRATRIX, Whalley Range; Messrs. J. and A. McBEAN, Cooksbridge; Messrs. SANDER and SOXS, St. Albans; Mr. W. SHURKLETON, Bradford.

AWARDS.

FIRST-CLASS CERTIFICATE.

Odontoglossum crispum var. *Mrs. E. W. Thompson*. The flower is of good shape, with brown blotches on the sepals; petals serrated, solid reddish-brown in colour with white margin; *Odontioda Diana magnificum*, a large, finely-coloured flower, both from P. SMITH, Esq.

Brasso-Cattleya Cattleya Joan var. Mrs. Gratrix, a well-formed flower of apricot-yellow colour, from Mrs. GRATRIX.

Cymbidium Alexanderi expositum, a large, well-shaped flower, lip bearing small crimson markings, from Dr. CRAVEN MOORE.

AWARDS OF MERIT

Odontoglossum Jasper var. *Ashworthii*, *O. Moonlight*, *Cattleya Mohel* (C. *Wauveri alba × C. Susanna Hyg. de Coum*), and *Brasso-Cattleya Barwa* var. *Diphne*, from R. ASHWORTH, Esq.

Odontoglossum Ceres, *Sir Trevor Lawrence's* var. (*Bolton × Rossii*), and *O. Cobham* var. *Mrs.*, from P. SMITH, Esq.

Cattleya Enid var. *Mrs. Gratrix*, from Mrs. GRATRIX.

Odontoglossum andatisianum var. *Caroline*, from Dr. CRAVEN MOORE.

Odontoglossum amabile Gilroyd var., from JOHN HABITTY, Esq.

CULTURAL CERTIFICATE.

Mr. DAVENPORT, gardener to R. Ashworth, Esq., for *Odontoglossum Jasper Mastereana*.

NORTH OF ENGLAND HORTICULTURAL.

FEBRUARY 16.—The annual general meeting of the North of England Horticultural Society was held at the Law Institute, Leeds, Mr. J. S. Brunton (chairman) presiding.

The statement of accounts, presented by the secretary (Mr. J. C. Jackson), showed a balance in hand of £70.

The chairman outlined the proposals by which the Council hoped to assist in food production, by organising a panel of lecturers on vegetable and fruit culture. The society's lecturers would be available to plot-holders in any part of the North of England, the local societies to pay expenses, which in all cases would be nominal. Local societies could become affiliated with the N.E.H.S. on payment of 10s. 6d. or £1 1s., and such societies would receive N.E.H.S. silver and bronze medals to award to the owners of the best cultivated vegetable gardens or plots in their area.

Earl Grey was re-elected president, and Mr. Brunton, chairman, Mr. Jackson, who resigned

the secretaryship, was elected a member of the Council, and the secretarial work will be resumed by the Rev. J. Bernard Hall, of Farnham Vicarage, Knarborough.

BRITISH WHOLESALE FLORISTS

The committee appointed at Essex Hall, on January 15, to arrange for the establishment of the British Wholesale Florists' Federation, has now so far advanced with the preliminary business that a general meeting will be held at Essex Hall, Essex Street, Strand, W.C., on Tuesday, March 13, at 5 p.m., for the purpose of presenting the proposed rules, and electing a president and committee for 1917. A statement of work already accomplished and progress made will be given on this occasion. The signatories at the original meeting are receiving a personal invitation to attend, but all wholesale flower growers and salesmen who are interested in the formation of a strong federation for mutual help and protection will be welcome. Officers have been taken at 55, Wellington Street, Covent Garden, W.C., but until these are ready for occupation all correspondence, including applications for membership, should be sent to Mr. Charles H. Curtis (secretary), c/o Mr. George Munro, jun., 4, Tavistock Street, Covent Garden.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

FEBRUARY 12.—The monthly meeting of the Society was held in the Royal Horticultural Society Hall, on the 12th ult., Mr. Chas. H. Curtis presiding. The sick pay for the month on the ordinary side amounted to £54 16s. 2d., and on the State Section to £28 14s. 2d., and Maternity benefits to £16. The Trustees reported that they had invested £691 in the new War Loan, which, with conversion, made a total of £5,200. The new rules for the Juvenile Section were ordered to be printed for adoption at the annual meeting, which will take place at the Royal Horticultural Society's Hall on Monday, March 12, at 7 p.m.

CROPS AND STOCK ON THE HOME FARM.

MAIZE

For sowing in milk green Maize is a little during dry weather in September and October, as at that time the grass supply often fails, and in the lack of a substitute the milk yield diminishes. It is commonly cut and strewn over the pastures once daily, or fed in the cow house at milking time. All kinds of stock do well on green Maize. The White Horse Tooth variety is mostly grown. One and a half bushels of seed per acre is sufficient, and it should be planted 3 inches deep. It sown shallow, rooks quickly and it will spoil the prospect of a crop. The land should be well manured and deeply ploughed in the autumn. The first week in May is early enough to sow the seed; if earlier a cold spell hinders growth; even excessive rains coupled with cold soil will cause the seed to rot. Sow the seed thinly by hand in the furrow following the plough, thus ensuring its security.

TREFOIL, OR FODDER CLOVER

Where sheep are kept mainly on stubble land a continual food supply has to be maintained throughout the year. A mixture of Trefoil and Italian Rye Grass at the rate of 8 lbs. per acre in April, along with Oats or Barley, provides much useful green food in June the following year. If not required green an extra crop of hay is assured.

THE MANAGEMENT OF CHICKENS.

Early in March is a good time to prepare for hatching chickens in quantity, for stock purposes. Cockers in November and December sell readily

if they are pure in breed and strong, vigorous birds. Pullets are even more profitable during the same period in egg production.

There are many types of incubators to choose from. The higher-priced machines are not always the more expensive in practice, as they are economical in their consumption of oil. Constant attention is the main factor in success. Full instructions in the management generally accompany each machine, and if these are carried out no trouble need be anticipated in obtaining a successful hatch. A room free from floor vibration is necessary, and the incubator must stand level on a firm base. The thermometer in the egg drawer should register 101° for two or three days, to ensure that all is in order before putting in the eggs. Some persons put in more eggs than the prescribed number. This I do not advise. The eggs should be perfectly fresh, of good size, of normal shapes and thin shells. As the eggs are placed in the drawer, on one side should be written in pencil the date, and on the opposite side a cross. This method of marking the eggs facilitates their being turned twice daily, to prevent the contents sticking to the shell and to cool the eggs for, say, ten minutes. There are various methods of turning the eggs in the drawer; some take out a few in the centre and roll the others over into that space. A more expeditious plan is to wet the tip of the index finger and roll over the eggs until the underneath mark is uppermost. The eggs should not be turned after the eighteenth day, but they should be cooled in the same way. The thermometer in the drawer should regularly register 105°; some prefer 104°, but not more.

When setting eggs under hens it is wise to put down two hens at the same time. If one is sitting alone, she occupies a whole coop, and may only produce quite a few chickens, whereas if two hens are put down at the same time, the two hatches, if not too large, can go with one hen, who can easily look after sixteen chickens. All the eggs in the two nests need not be of the same level; but do not give a hen strange chickens after she has had her own for several days, or she may kill the others. As the chickens hatch, remove the empty shells, or they may become encased over the end of hatching eggs. In such a case the emerging chick might be smothered. Leave the chickens under the hen until they are quite dry. They do not require food for the first twenty-four hours. The coop should be new, or newly white-washed, and be placed on a board floor on grass, in a sunny, sheltered spot. In very dry weather this board floor is not required.

First put the hen in the coop, giving her a little food. She will collect the chickens under her wings at once, where they will obtain the desired warmth. Four times daily after the first twenty-four hours the chickens should be fed with just as much as they will eat.

There are two kinds of chicken food, the dry and the wet. The former consists of prepared dry food mixed by the vendor, and it forms an easy and efficient method of feeding. The wet food consists of hard-boiled eggs, soaked bread scraps or biscuit meal, mixed with oatmeal or middlings. The latter may be cheaper, but the dry method has its advantages. Too much egg food is liable to cause diarrhoea. Upon the slightest sign of this complaint, add powdered chalk to the food and reduce the amount of egg.

When the coops are upon grass they should be moved several times daily, as tainted ground is fatal to chickens. For chickens fed upon soft food, water is not necessary until they are six weeks old. At no time is it wise to give them too much. To the hen in the coop water should be given daily. Maize should be her principal food. It is not recommended to feed her with the chicken feed. The drinking vessels and the water should be quite clean.

SCOUR BASKET.

In a recent note I spoke in favour of this pad for fattening cattle. Here there are two acres still in the ground, and after the recent frost 19° I find the roots are quite sound. They bury themselves in the ground even more deeply than Parsnips, and the ample foliage affords protection. Horses and pigs eat

them with avidity, and if used reasonably they should prove a valuable food.

KOHL RAB.

Where a difficulty is experienced in obtaining good crops of Turnips, Kohl Rabi is a good substitute. The plants are also not so liable to insect pests or mildew. Champion Short Top variety is the best for an early feed for fattening lambs, giving a greater bulk of food.

The Hardy Green variety is later, and is very nutritious, but should be used before the roots become too old. The cultivation is much the same as that of Turnips following a straw crop. Dull 3 lb. of seeds per acre, and transplant the seedlings in June to fill gaps, to make an extra plot, or to fill vacancies in the Turnip or Swede crop. *E. Molyneux.*

Obituary.

JOHN H. BOWDEN.—We regret to announce that Mr. J. H. Bowden, formerly head gardener at Tolven, Redruth, died on the 20th ult., at the advanced age of 89 years. He was born at Helston, and served his apprenticeship in the gardens of Miss Smedley at that town. Later, he was gardener at St. Erth and in Worcester. In 1867 he took control of the gardens at Tolven, in the service of the late Mr. Alfred Lanyon. For forty years he was one of the most successful cultivators and exhibitors in the West of England, his specimen stove and greenhouse plants being remarkably good. At the age of 79 he retired, and spent his last years cultivating the flowers in his own small garden.

ETIENNE SALOMON.—We regret to learn from the pages of the French horticultural press of the death, on January 27, of the celebrated French vine grower, Monsieur Etienne Salomon. He was born at Saint Giers in 1847, and early took up the occupation of Grape growing. He settled at Thomery, where he established a vine yard of which the reputation has become almost universal; his wonderful collection of vines will long be remembered by horticulturists who visited his establishment. His activities were not confined to the growing of fruit, and he studied exhaustively such subjects as the preservation of Grapes and their transport abroad. He obtained a number of distinctions, being an Officer of the Legion of Honour, Chevalier du Merite Agricole, vice-president of the Société Nationale d'Horticulture de France, and president of the Syndicat Central des Primeuristes Français. He leaves a widow and one son.

CHARLES HENRY ROBINSON.—We regret to record the recent death of Mr. C. H. Robinson, for the past 25 years gardener to Mr. H. L. Williams, Chichester Road, Croydon. Deceased was only 49 years of age, but had been suffering for some time from an affection of the nerves. He leaves a widow and young son.

REPLIES.

PROTECTIVE COMPOSITIONS FOR TREES.

REPLIES to N. (p. 80), the composition he refers to is Abbot's Tree protective composition, for protecting trees from insects. The material is sold in tins at 1s. 6d. and 3s. 6d., and in 2½ cent kgs. at 2s. 6d. Stewart and Co., 13, South St., Andrew Street, Edinburgh.

It may be interesting to state that we use a mixture composed of 2 ounces each of black soap, sulphur, and soot dissolved in water to the consistency of paint. The specific is usually applied with a brush, but for shrubs it is strained and applied by means of a syringe. The composition has proved effective against rabbits and mice, and it retains its deterrent powers for two or three years. It does not injure the tenderest bark or bud, and it is also a powerful insecticide. *Barn-duth.*

MARKETS.

COVENT GARDEN, February 25

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—Eds.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Arums, Azaleas, Camellias, Carnations, Dahlias, and Tulips.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage plants and their prices, including Adiantum, Asparagus, Ferns, and Myrtle.

French Flowers, &c.: Average Wholesale Prices.

Table listing various French flowers and their prices, including Aemone, Lilac, and Marguerite.

REMARKS: Latest consignments of cut flowers are arriving and for most kinds the prices have fallen considerably. Carnations are much cheaper than last week. Roses are improving in quality very fine from Richmond, Saraband, and Pink Queen are sought for sale. In addition to William's (yellow) and Clara Butt there are a few other varieties of Darwin Tulips. Home-grown Dahlias are arriving in much finer condition, and consist chiefly of Emperor Golden Spur, Princess, Sir Watkin, and Victoria. There are also abundant supplies of Snowdrops, and a few English Violets, which find a ready sale. A much larger consignment of Guernsey and Sicily flowers is reaching Covent Garden last week and consisting chiefly of yellow and white Natives, Daffodils, Freesia, a few consignments of Anemone tuberosa and Albino (star of Bethlehem), which add largely. High prices are still realized for tulips, such as Apache and pinks. A Stronger Adiantum Fern (Maidenhair), and Smilax. Hardy foliage is more plentiful. The arrival of French flowers is very uncertain.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Aralia, Asparagus, Aspidistra, and Cyclamen.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Beans, Broccoli, and Cabbages.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples, Bananas, Chestnuts, and Grapes.

REMARKS: Supplies of English Apples are limited, but the market is well supplied with imported Apples in boxes, and a fairly plentiful supply of Nova Scotian and United States barrelled bins. Pears from California consist principally of the variety Winter Nones. A consignment of Cape bins is being consigned to Paris, containing Apples, Avocettes, and Melons. Supplies of grapes are decreasing, pointing to the closing season. Forest Rhubarb is very plentiful, and there is a fair quantity of Siskale. Melons are a better supply but quantities are only a moderate quantity of Asparagus there are fairly large supplies available. The market is nearly cleared of French Tomatoes (under the vegetable and fruit) and becoming scarce. P. H. R., Covent Garden Market, February 25, 1917.

Potatoes

REMARKS: There is a good demand for Potatoes, but here are not sufficient stocks in London to meet requirements. Favored J. Newborn, Covent Garden and St. Pancras, February 28, 1917.

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS.—The usual monthly meeting of this Association was held on Thursday, February 22, Mr. G. W. Harford presiding. The lecturer was Mr. Leader, representing the Reading Association, who read a paper entitled "The Value of Observation to the Gardener." Mr. Leader's remarks were followed with much interest. The two prizes, which were given by Mrs. Cary Batten, for two Cyprinellus, were won by Mr. Jennings and Mr. Scott. Mr. Blanchard was awarded a Certificate of Merit for two pots of Freesias.

BATH GARDENERS.—The monthly meeting of this Society was held at the Foresters' Hall on February 12. Mr. T. Parrott presiding. A paper on "Orchids" was read by Mr. R. Jennings, of the Bristol Gardeners' Association.

GARDENING APPOINTMENT,

MR. F. W. BUSSON, for the past 14 years Gardener to Col. R. Barrack, at Gardener to C. P. Parsons Esq., Wipers, Stebbins, Bournemouth, Sussex. [Thanks for donation to R.G.O.F. box.—Eds.]

BLEEDING OF VINES: H. J. S. Nothing you can do now will stop the bleeding of your vines, but it will cease soon after growth commences. You were too late in pruning, and kept the house too warm after the roof was repaired. Frost will not injure dormant vines provided the rods are well ripened.

LEAVES FROM ROADS: J. T. The presence of either petrol or tar in the material you have obtained from the road will certainly be injurious to the crops, and your suggestion to remove the leaves from the ground had better be carried out. Since the smell of tar is apparent in the leaves, they must be impregnated with it. You could burn the leaves and use the ashes, which will contain potash, burning out the tar and petrol in the process.

NAMES OF FRUITS: F. G. T. Cucurbitaceous fruit. Unable to trace; send leaves and flowers when in bloom.—Shropshire. Apples, (1) Winter Greening; (2) Loudon Pippin; (3) Baxter's Pearmain.

NAMES OF PLANTS: R. M. Satterly. Bilbergia nutans—A. H. L. The imperfect flowers sent are probably Calanthe Veitchii. After flowering place the plants on a shelf in an intermediate house and keep them perfectly dry until growth starts again, when they should be watered and watered sparingly until root action develops.—H. P. D. 1 and 2. Forms of Cyperopodium Actaeus (insigne x Lecanum); 3, Cyprripedium Calypso (Boxallii x Spicerrimum). All the others are forms of Cyprripedium Dicksonianum (Heia Euryades x villosum). A batch raised at Langley and named Countess of Carnarvon showed all the variation seen in the flowers you send.—Robyt, 1, M. dorsiventer floribunda; 2, Acacia armata; 3, Ardisia crenulata; 4, Azalea amoenata; 5, not recognised, send when in flower.

PLANTING POTATOES: T. C. The variety Up-to-date still succeeds well on certain soils, but unless you know that it is suited to your district you would be better advised to select a more recent variety. Ascertain which sorts succeed well in the district, in similar soil to that in the beds you are going to plant. In ordinary districts the best time for planting is about the end of March; if late frosts occur after the sprouts are through the soil, draw a little earth lightly over the tops to protect them. The trench in which the tubers are planted should be 5 inches deep, or 7 inches if manure is placed in the bottom. The rows should be 3 feet apart, and the tubers 18 inches apart in the rows.

Communications Received.—H. L. Stoke Poges, F. J. H.—Beal, G. P. B.—W. C. M.—G. H. B.—Courtney, P.—T. B. Leicester.—Sir A. F. W.—G. A.—E. B.—T. W., Manchester.

FERNS' FERNS.—True Ferns, Climbing Ferns, Basket Ferns, Stove and Greenhouse Ferns, Hardy Garden Ferns, catalogues free.—E. SMITH, London Fern Nursery, Loughborough Junction, London, S.W.

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line.

Gardeners desiring their Advertisements repeated must give full particulars, otherwise no notice will be taken of their communications. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. On no account should they enter into communication with unknown correspondents who require a fee beforehand.

Advertisers are cautioned against having Letters addressed to Initials at Post-offices, as all Letters so addressed are opened by the Postal Authorities and returned to the Sender.

PRIVATE.

WANTED, HEAD GARDENER, where speciality: Egg and Rock Gardens; some Glass; good cottage; wages 35s.—LADY TONSONBY, St. James's Palace, S.W.

WANTED, HEAD WORKING GARDENER, careful manager, having first-class experience, where 3 or 4 are kept; undesirable references required; ineligible; good wages, cottage, and garden.—Full particulars to G. HAMPTON, Norton Manor, Sutton Sottery, Hants.

WANTED, GARDENER (HEAD WORKING); man or boy; duration of war; Vegetables chiefly, some Glass; cottage.—State wages, experience, &c., to S. GASK, The Hill, Westby, near Kirkham, Lancs.

WANTED, GARDENER (HEAD WORKING); ineligible; experienced Inside and Out; wages 30s. a week.—MRS. REID, The Oaks, Hanworth, Middlesex.

WANTED at once, SINGLE-HANDED GARDENER for private house in Boston; Conservatory, Greenhouse, and Kitchen Garden; good wages to suitable man. Apply, W. W. JOHNSON & SON, LTD., Boston, Lincs.

WANTED, by a Lady, a SINGLE-HANDED GARDENER or experienced LADY GARDENER; small Vinery, Fruit, and Vegetables.—MRS. POLE, Chichester Green Lodge, Newbury.

GARDENER, Single Handed; Bachelor or Widower; no Glass; in Surrey; wages 25s., with board and lodging.—Apply J., 23, Pall Mall, London, S.W.

WANTED, at once, Good SINGLE-HANDED MAN or LADY GARDENER for Chislehurst. Call, MRS. DE BECK, Hotel Waldorf, between 10 and 11.

DISCHARGED SOLDIERS and **OLD MEN** WANTED as GARDENERS. Head, Single Handed, and Under; all suited entirely free, and valuable presents given. **HEAD GARDENERS.**—(1) South Wales; £70, house and garden; last man there 10 years. (2) Cheshire; 2 Under, Inside and Out; £70 and cottage. (3) Hert; 1 Under; cottage found; Vegetables, Fruit, and simple Flowers. **SINGLE HANDED.**—(4) Highbury; 3 and 5s; live out; 1 acre Lawn and Kitchen Garden; 5 small houses; last man there 5 years. (5) Hert; 30s; live out; cottage easy to obtain. **TENDER.**—(6) Wilts; Second of 2; wide arched to lodge gates; certain privileges attached (7) Surrey; 2 kept; 25s. weekly; share cottage. Call, write, or phone. Office hours, 9 to 9; Saturday, 9 to 2.—MRS. HUNT, LTD., 86, High Street, Marlborough. Tel.: Mayfair 6200.

WANTED, SECOND GARDENER, experienced Fruit, Flowers and Vegetables; single preferred.—Age, wages and references to A. DICKSON, The Gardens, Wychik Hall, near Barnard Castle, N.R., Yorkshire.

WANTED, a good SECOND GARDENER for Inside, well up in Fruit and Plants; good wages; duty and overtime paid for.—Full particulars to BLACKWOOD, Foston Park, Slough.

WANTED, a SINGLE MAN or Married without family, as Second, for Glass Houses, having good experience, including Orchids and Carnations; excellent references required; ineligible; good wages.—Full particulars to G. HAMPTON, Norton Manor, Sutton Sottery, Hants.

WANTED, GARDENER, experienced, married man, to live in lodge, rent free; £1 5s. weekly, and vegetables.—Apply, MRS. FILLINGHAM, Syerston Hall, Newark.

GARDENER WANTED, place near Man-ningtree, with 4 Coots, and 1 Pond; wages 28s. and 10s.; house provided.—All particulars to Box 351, G.P.O., Manchester.

WANTED, for Oxfordshire, near Wallingford, **WORKING GARDENER**, knowledge of electric lighting plant an advantage; no Glass; wife caretaker and cook or housemaid when family are there; to live in house, having every convenience; good wages to suitable couple—Apply: **GLAXE WILLIAMS, ESQ.**, 7, Berkeley House, Hay Hill, London, W.

WANTED, KITCHEN GARDENER; intelligible, or discharged from Army—Apply, **H. H. SCOTT**, Newtown, Leigham Court Road, Streatham, S.W.

WANTED, an UNDER-GARDENER (intelligible for the Army), married or single, for a Gentleman's Country Estate—Apply, **JAS. MARTIN & CO.**, Land Agents and Surveyors, Wainfleet, Lincolnshire.

WANTED, at St. Leonards School for Girls, St. Andrews, Fife, a fully qualified and well-educated **WOMAN**, to act as **HEAD GARDENER** and **INSTRUCTOR** in **GARDENING**; knowledge of the growth and sale of Vegetables and the care of Grass is essential, and some experience in teaching desirable. For further particulars apply to the **HEAD MISTRESS**.

WANTED, TWO LADY GARDENERS. First-class Head and Second Gardener, for nobleman's situation in Cheshire; modern house, and every comfort—Apply, **MRS. CLEGG**, 78, Albert Hall Mansions, Kensington, London.

WANTED, experienced LADY GARDENER, to take charge of Glass Houses and Flowers—Apply, **A. CROSSMAN**, Hill House, Harrow Weald.

WANTED, LADY GARDENER for general work—Apply to **THE CURATOR**, Chelsea House Garden, London, S.W.

WANTED, TWO LADY GARDENERS, with experience; Inside; Bothy, milk and vegetables—Apply, with references, stating wages required, to **W. H. ALLEN**, Minley Manor Gardens, Farnborough Hants.

WANTED, TWO WOMEN GARDENERS for Inside and Out, with some experience preferred; Bothy found, good opening to gain thorough knowledge of Gardening. State wages. **LEE**, Stag-horn Gardens, Cambridge-on-Tyne.

WANTED, TWO WOMEN GARDENERS, under Head, one for Glass and one for Herbaceous Borders and Rockery, rooms, &c. State wages. **MISS INSOLE**, The Court, Landail, Cardiff.

LADY GARDENERS WANTED for (1) Weybridge, as Head, with another Lady as Under; about 3 acres of ground; little Glass. (2) Wokinghampton, two wanted, one as Head and the other as Under; understand milking. (3) Bexley, two wanted as Under Gardeners; all round knowledge of Gardening, understand Peaches and Carnations. (4) Norfolk, as Under, 3 men, boy, and woman kept, chiefly to work in the Houses, Fruit and Flowers; slight experience necessary. (5) Herts, as Single-handed, much experience not necessary. Lady Gardeners are suited entirely free of charge. **MRS. HUNT LTD.**, 86, High Street, Marylebone.

WANTED, for Kitchen Gardens, Two or four **LADY GARDENERS**; furnished accommodation. Apply, stating wages required and with references, to **FEICZY DUBBING**, Shrubland Park Estate Office, Hayham House, near Ipswich.

LADY GARDENERS. — Good Posts vacant for trained women. Apply to **THE WOMEN'S FARM AND GARDEN UNION**, 45 (6th floor), Queen Anne's Chambers, Westminster, S.W.

WANTED, FOREMAN, for Inside and Out, intelligible, married or single, good Bothy or cottage, &c. Apply, with references, stating wages required, to **ESTATE OFFICE**, Bedford Park, Bedford, Herts.

WANTED, good FOREMAN or good experienced **JOURNEYMAN** (intelligible or ever) bothy (and) in Inside Flowering, good wages to suitable man, Bothy and vegetables, also **YOUTH**, about 17, who has had some experience in Gardening, good wages and Bothy — Apply, **JAMES VERT**, Chuk Castle Gardens, Whitehurst, Rubon, N. Wales.

WANTED, JOURNEYMAN (Inside and Out), 25, and Bothy, 28, 6d. duty. Also two **W.M.** Outside, Pleasure Grounds, &c.; 25, and Bothy — **MR. FENTON**, Warren House Gardens, Kingston Hill, Surrey.

MARRIED COUPLE required as Cook, Gardener, and **SINGLE HANDED GARDENER**, in small family, good, comfortable home and wages offered. Particulars, **RAND**, Woodburn, Slough.

WANTED YOUNG MAN, for charge of Glass, also strong **YOUTH** for Inside, 16/7, or over if intelligible; good wages and Bothy, with usual allowances—Apply, **HEAD GARDENER**, Sdbury Manor, Southmouth, Devon.

NOTES FROM A GALLOWAY GARDEN.—III.*

NEVER was there an after illustration than the past winter has afforded of the weather described in rural parlance as "feeding a frost." From before Christmas onward, right through January, the mercury hovered round the freezing point, never more than two or three degrees above or below it. Then, when the frost was full "fed," it set to work in earnest, and we had a three weeks' spell of such cold as has not befallen us since the memorable months of January and February, 1895. In that year the frost was far more severe than anything we have had to bear here in 1917, for on that occasion the shaded thermometer twice registered zero Fahr.; but a thick and beneficent mantle of snow averted injury from many susceptible subjects. This year the risk has been greater, for, although the shaded thermometer has only twice fallen so low as 17° Fahr., there has been no snow. Yet, so far as can be seen, we have escaped cheaply, probably because the frost was steady, without trying alternation of freezing and thawing.

The plants introduced since 1895 are so numerous and various that it is very interesting to note their behavior in their first experience of a hard British winter. It is too early to judge of the effect upon bulbous and herbaceous subjects, but it is satisfactory to record that plants, both new and old, have suffered very little. Among the new Chinese *Rhododendrons* collected by Messrs. Wilson and Forrest no deaths have occurred among about forty species here. Even *R. habrochitum*, which, I believe, comes from Southern China, and about which I had considerable misgiving on account of its soft, hairy foliage, is quite fresh and vigorous. It was, indeed, favoured above the other species, because, being the only specimen we had, it was given the protection of some branches of *R. ponticum* placed round it. *Leptospermum scoparium* (9 feet high) and its varieties

Nichollsi and *Chapmannii*, *L. lanigerum* and *ericoides*, have not suffered in the least. Some species of *Olearia* have been reported of doubtful hardihood. *O. semidentata* we have not got yet, and *O. insignis* we lost in a wet winter two or three years back; but *O. nitida*, *ibifolia*, *macrodonta*, *nummularifolia*, and *Gunnii* are untrouched. *Eucryphia cordifolia* is un-

showing in fine contrast to the brighter emerald of *Illicium religiosum*. What one dreads for this *Eucryphia* is a late spring frost to blacken the rubicund young growth which it is prone to put forth too soon.

The myriad flower-buds of *Tricuspidaria lanceolata* in open borders are uninjured; but *T. lanceolata* against a wall is pretty severely cut in one instance, and perhaps fatally in another. I do not regret this, for it is a very inferior plant to the other. *Caleolaria integrifolia*, a fine thing when of large size, has been killed back to the root in some cases, beyond it probably, in

the open border. *Spartium junceum* has been severely cut. It is time I brought this long story to a close by saying that, while an immense bush of *Philonis fruticosa* is hanging the points of its silvery shoots, *Fabiana imbricata*, *Phygadeuon capensis*, *Abrutylon vitifolium*, and *Solanum crispum* remain in their customary vigour in the open, while plants of *Mutisia decurrens* on walls are bearing fresh young growths erect.

Among the bewildering multitude of *Barberis*, two are especially beautiful at this season, although, of course, flowerless. One is the glossy evergreen, *Barberis Knightii*, which Mr. Bean tells us is a variety of *B. Hookeri*, differing from the type in its extraordinary vigour and much larger leaves, which are green on both surfaces; the other is the deciduous *B. virescens*, which atones for the sickly pallor of its flowers in summer by the beautiful orange-red wands which it displays in winter.

FIG. 36.—SNOWDROPS IN A SCOTTISH WOODLAND.

others, but the prettier *C. violacea* remains quite safe against a south west wall alongside of *Berberidopsis corallina*. *Lupageria rosea*, flowering against a north wall in November, received no covering (I cannot be bothered with plants that require protection), and is none the worse for the winter; neither are *Abelia floribunda* and *Siphoria* (*Edwardsia*) *grandiflora*. Here and there a *Cistus* has succumbed, but that happens almost every winter in our dripping climate; the majority, however, including *C. purpureus*, *Lortetii*, *seymoulii*, *formosus*, and others, are unhurt. No damage has been done to *Osmanthus Delavayi*, *Semeio Grayi* and *laxifolius*, nor to any *Bambusa*, except *Arundinaria* (*Themonebanensis*) *Falconeri*, whose of the canes, twenty feet high, appear to be killed, though the base of the plant is quite vigorous. It is strange that, while *Notosporium Carmichaelii* and *Carmichaelia australis* remain quite unhurt in

The frost has imposed a wholesome and timely check upon early *Rhododendrons*. These should come to their own now, and the bulging flower buds of *R. barbatum*, *glaucum*, *ciliatum*, *praecox*, and others promise a fine display in March. Most plants of *R. arboreum*, however, are going to be very sparing in bloom, and a large bush of *R. Luscombei* (*Fortunei* × *Thomsonii*), which was loaded last year, has hardly any flower buds now.

The blooms of *Barberis japonica*, usually one of the chief joys of winter, were destroyed by the frost, and methought that the *Witch Hazels*, being in full flower when it set in, must have followed suit, especially when, on two days with fifteen degrees of frost, the bushes were so densely sheeted with hoar that hardly a gleam of their yellow petals was visible. But these petals have a marvellous power of resisting cold; when the thaw came, the plants were as if nothing had happened, and are still (February 23) at their best, though *Hamamelis*

* For previous articles see Jan. 13, p. 13, and Feb. 17, p. 69.

mollis began flowering before Christmas. *Parrotia persica*, on the other hand, began to shake out its vermilion anthers on February 5, when the frost was at its hardest. It is not so showy as its relatives, the Witch Hazels, and, unlike those precocious shrubs, I have never known it flower here until it is at least twenty years old.

Perhaps there is no genus whereof the species adopt so many disguises as the Knotweeds (*Polygonum*). I am well pleased to find that *P. equisetiforme*, which I received from Kew two or three years ago, has weathered the cold without any protection. Unlike many of the family, its growths are perennial, like very slender Rushes, which in autumn become studded along almost their entire length with small white flowers. *Herbert Maxwell, Monroith.*

ORCHID NOTES AND CLEANINGS.

NEW HYBRIDS.

ODONTOGLOSSUM BROTHAM.—This hybrid *Odontoglossum*, raised from *amabile* × *Lambardianum*, is a fine flower of good shape, richly blotched and tinged with claret-red.

ODONTIODA BELICE.—The *Odontoglossum* parent of this hybrid is *Her Majesty*, which secured the R.H.S. First-class Certificate on May 22, 1912, and it brings exceptionally fine qualities to the new hybrid, whose other parent was *Oda rosefeldensis*. The sepals and petals vary from copper colour to greenish-orange, with a slight trace of mauve on the margin of the lip. The yellow, which will intensify when the plant matures, comes from the *Odam triumphans*, which, with *Cochlioda Noezliana*, produced *Oda rosefeldensis*.

Both these were sent by C. J. Phillips, Esq., The Glebe, Oak Lane, Sevenoaks, who states that, being interested in Kentish lore, he names many of his hybrids with Doomsday names (A.D. 1066) of towns and villages in Kent. His Orchid-grower (Mr. R. Bucknell) having gone on military service, Mr. Fletcher, formerly with R. Ashworth, Esq., is filling his place.

VANDA MISS JOAQUIM.

A three-flowered inflorescence of a very interesting form of *Vanda*, named *Miss Joaquim* (teres × *Hookeriana*) is sent by Mr. F. C. Puddle, gardener to W. H. St. Quentin, Esq., Scampton Hall, Rillington, Yorks. The hybrid, which was raised at Singapore, and described in *Gard. Chron.*, June 24, 1893, p. 740, has rosy-violet flowers, with rich orange in the labellum. The variety sent appears to be distinct from the original, and may be a reversion towards *Vanda teres* in the form of the lip and in some other characters. The flowers are bluish-white, and the labellum has a green base and spur. Examination with a lens discloses in the rose-coloured spotting on the labellum distinct traces of *V. Hookeriana*. *V. Miss Joaquim* is usually summer-flowering, but this variety is said to have flowered always in February. It is not known whether several plants were raised from the original cross, or if it has been raised again. If so, this is a seedling variation with colour suppression.

ERIGERON B. LADHAMS.

I saw a good collection of the newer *Erigerons* in a Scottish garden last year, and was pleased to observe among them the fine hybrid, or reputed hybrid, known as *B. Ladhams*. The plant grows nearly 2 feet high, and so the flowers can be cut with long stems, which make them suitable for inside decoration. The blooms are rose-coloured, and the narrow ray florets give the elegant appearance which constitutes one of the merits of most of the *Flea Banes*. *S. Arnott.*

THE MARKET FRUIT GARDEN.

RAIN fell on only five days in February, and melted snow was measurable once, making the small total of 0.82 inch. Frosts from 2° to 12° occurred nearly every night until the 15th, after which there was mild weather, with many foggy days, and all the rain measured during the month. As the frost penetrated to the depth of at least a foot in the ground, some days of thaw were necessary to make it workable; but digging was practicable after the 20th. Snow lingered on the ground nearly as long as frost bound it. Yet birds did extremely little damage to the buds of Plums. In this connection their behaviour is inexplicable to me; they often do more damage in a mild winter than in a severe one. Vegetation of all kinds is very backward.

PROBLEMS OF FRUIT-PLANTING.

A correspondent asks questions in relation to the verdicts given in Woburn Fruit Station reports as to ramming trees when planting, the alleged uselessness of taking care to preserve the fibrous roots, and the comparative failure of growing Apple trees in grass land. I have experimented with ramming in two orchards, and have not found any difference between the rammed rows and those in which the soil was simply stamped in well over the roots of the trees. But then I always insist upon firm stamping-in, though without bruising the roots, so far as this can be avoided. Ramming is probably beneficial in quite light soils, but is an unnecessary expense, in my opinion, where the soil is even moderately stiff, except in the case of bush trees, branching out somewhat close to the ground, so that they cannot be staked, to keep the wind from blowing them about, and loosening the soil around the roots.

It seems to me desirable to preserve the fibrous roots on trees when planting, provided that they are alive at the time. Often, however, the finest of the fibrous roots have died through being kept too long out of the soil between the times of raising from their nursery beds and planting them, in which case they are clearly useless.

As to the relative advantage of growing Apples in arable or grass land, all the evidence that has come before me is in favour of the former plan. Nothing, it appears, is more fatal to the vigorous growth of young trees than the plan of planting them in grass land, and letting the grass grow closely around them at once, or even after three or four years. No one can drive about a fruit district without seeing thousands of trees so treated, miserably dwarfed things that can never grow to more than half their proper size. In part of one of my orchards ramming grass grew so persistently that it was almost impracticable to keep the land clean by digging it in winter, and hoeing it repeatedly in spring and summer. The soil was in so finely divided a condition that the slightest shower rooted the grass afresh after it had been hoed up. Therefore, when the trees were ten years from the planting, the grass was allowed to grow around them, being brushed and left on the ground once or twice in the season. In the third year of this trial, however, the dwarfing effect of the plan was so obvious that the land was restored to arable conditions. The outside row of trees had half its roots in arable land, kept clean by hoeing during the three years, and its superiority to the next row and others surrounded by grass was a very striking object-lesson. In this case the variety was Lane's Prince Albert, a poor grower on my land. But in a piece of Worcester Pearmain in the same orchard the same experiment was tried at the same time, with similar results. In this case also one outside row bordered upon land kept hoed, and its superiority to the rows surrounded by grass was remarkable. Both pieces were dug

after three years in grass, three years ago, and the trees have partially recovered. It must be mentioned, however, that some strong growing trees, such as Bramleys, Newton Wonders, and Royal Jubilees, near to Lane's Prince Albert, withstood the effects of grassing well enough. Everyone interested in fruit knows that there are thousands of acres of flourishing grass orchards of Apples, and Cherries are usually grown in grass. Vigorously growing varieties of Apples may have grass left to grow around them when they are mature with comparative, if not complete impunity. The fruit will not be as large as if the land were cultivated; but its colour will be better. Considering the great saving in expense in grass orchards, it is not certain that they do not pay as well as arable orchards. In several trials in the United States between what are called there "sod and mulch" orchards and arable orchards, in which a cover crop is annually grown and ploughed in, the latter, in most cases, have come out first in value of crops; but, if memory serves, no account has been taken of difference in expenses.

DOES GRASS IN ORCHARDS FOSTER INJURIOUS INSECTS?

A reply to this question seen recently was in the affirmative; but no proof was given, and it is doubtful whether evidence of any considerable account on the subject has ever been collected. Some large growers, who have both cultivated and grass orchards, might be able to throw light on the subject. At the same time, they might give their opinion as to whether fungous diseases are less prevalent in grass than in arable orchards. It seems to me that they are likely to be so, because grass land is drier than arable in winter and spring.

MINIMUM WAGES AND GRASS ORCHARDS.

The impending minimum wage of 25s. a week for every able-bodied man employed on a farm will probably lead to many mature Apple plantations now under cultivation being left to grass themselves, provided that there are no bushes growing among the trees. Such a minimum for all men between 17 and 61 years of age, which is the definition given by the Prime Minister of "able-bodied men," will render the work of digging and hoeing very costly. Men commonly earn as much or more at piecework; but this is widely different from their getting at least 25s. per week, "wet or dry," for what is often very leisurely day work. For a considerable portion of the year rain, snow, frost, or the wetness of the soil after rain or snow render work in the open impracticable, and on fruit farms, even more emphatically than on ordinary farms, there is very little profitable work for men under cover. Then fruit-growers have no guarantee of minimum prices for their produce, as ordinary farmers have for Wheat and Oats for six years, so that, unless duties are to be put upon imported fruit they will have no reason to expect prices above those of former peace times after the war is over.

THE CONDITION OF BLACK CURRANTS.

The promise of a Black Currant crop in my orchards is a very poor one. Probably, in consequence of the full crop of last season, the extension growth is scanty, and the number of dead branches is quite extraordinary. The buds, too, are small and backward.

KEEPING APPLES

The holding-back of long-keeping Apples till February can hardly have paid this season, as Bramleys made 11s. to 12s. 6d. per bushel in the latter part of last November, and were quoted no higher than 12s. to 14s. in the third week of February, when very few were left. The ordinary amount of waste would cover the difference in price. *Southern Grower.*

ILEX VERTICILLATA.

ILEX VERTICILLATA (see fig. 37) is the best of the deciduous Hollies for gardens. Specimens at Kew have been very attractive during the past autumn and early winter, the berries being of a rich sealing-wax red prior to the fall of the leaves. The bushes are showy in the pleasure grounds, and provide useful material to cut for indoor decoration, especially during the Christmas season. The Winterberry, the name by which this Holly is known in the United States, is suitable for indoor decorations, the sprays being more graceful than those of the common evergreen Holly.

Ilex verticillata, A. Gray, or *Prinos verticillatus*, Linnaeus, is a native of Eastern North America, and was first introduced into this country in 1756. It is a deciduous shrub of pleasing

will be found a much more appetising vegetable. Cooked properly and served with white sauce they make an excellent and palatable dish, tender, succulent and wholesome. *E. M.*

WAX POD, OR BUTTER BEAN.

MANY contributors to the *Gardeners' Chronicle* have urged us to grow this remarkable Bean, and I would again recommend it to all who have not tried it. It is a great favourite on the Continent, and will be enjoyed by any person who will give it a trial. Golden Wax Pod is the best variety I know; it requires the same treatment as the French Bean. *C. Davis, Holy Wells Park Gardens, Ipswich*

THE HARIHOT BEAN

THE Haricot is a highly nutritious food product, can easily be grown on any but the heaviest

taining seed, and as they should be sown at the end of May there is a possibility of utilising ground for this purpose which cannot be got ready for crops which require earlier sowing. (It is highly desirable that the seeds should be purchased of a reputable seedsman, and not at the grocer's, as the former will doubtless supply tested varieties.—Eps.] *W. Auton, The Gardens, Pargford Court, Woking*

POTATOS UNDER GLASS AND OUT OF DOORS

AT the beginning of last year, in discussing the question of producing very early Potatoes with my employer, who was willing to substitute Potatos for flowers, I suggested the use of a small house that had been used for growing Carnations in one section and Melons in the other. In the division used for

FIG. 37.—*ILEX VERTICILLATA.*

Photograph by E. J. Wallis

spreading habit, 6 to 9 feet or more in height. The plants thrive in most soils, and are readily increased by layering and seeds. There are several varieties, including *chrysearpa*, which has yellow fruits. *A. G.*

VEGETABLES.

THE VALUE OF LEEKS.

SOME writers have said much in favour of Leeks as a vegetable grown in the ordinary way in the open by dibbling a deep hole at planting-time (in May), dropping the plant some inches deep in the holes, and allowing these to fill up by degrees, thus becoming blanched and ready for use during the winter and spring, when they are most appreciated. It, however, they are cultivated on Mr. Beckett's method of producing exhibition specimens, with at least 16 inches of blanched stem 2 inches thick, Leeks

grow in the southern half of England, and might become a potent force in alleviating the possible food shortage should the war continue through another winter. I grew a considerable quantity last year on comparatively rough and unimproved ground, and found the return to be about one hundredfold.

It is now too late to increase materially the Wheat supply for this year's harvest, but much could be done to encourage the sowing of Haricots amongst the small growers. I suppose there is no district in the United Kingdom where the advice of head gardeners is not being sought by the local organisations for food production, and if we could be the means of inducing all those who are taking up food plots to grow even a few Haricots the total amount would be enormous and of great national value.

I have tested the germination power of those bought at the grocer's, and find it to be about 90 per cent., so there is no difficulty in ob-

taining them. I grew Potatos, and in the other French Beans. The house has a span roof, with side stages. The tops of the stages are corrugated iron covered with a layer of gravel; the gravel was removed, and in its place we put a layer (about 2 inches) of a mixture of lime rubble, burnt refuse, and leaf-soil. Then I had got together a sufficient quantity of half-and-half garden soil and soil from Cucumber frames, with some burnt refuse, old mortar, and soot. The whole was thoroughly mixed together and placed on the stages to a depth of about 8 inches. The Potatos (*Sharpe's Express*) had been boxed some time before; they were planted in rows across the stages, 15 inches being allowed between the rows and 9 inches from set to set in the rows. Lettuce was planted between the rows, and the stages edged with Mustard and Cress, which was very useful and gave the whole a neat appearance. As the Potatos were lifted and the eatable tubers taken off, as an experiment I replanted

them. During the early part of the time, when the plants were immature, they produced a second crop of about half the quantity of the first, but I found, as the plants became more mature, the second crop got less and less.

I am growing Potatoes again this year; the first batch was planted on December 25, and the plants are now well above ground, but instead of replanting this year I hope to have a second lot in pots, and as I take up the first I shall replace them with the pot plants.

Our French Beans are planted on similar lines to the Potatoes. The Potatoes gave an average crop of about 1½ lb. per root, of most excellent quality. I notice some of the advice for growing under glass is to box the sets crown ends up and cover with a mixture of leaf-soil, spent Hops or ordinary soil mixed with old manure. I think the advice a great mistake, as any experienced grower knows that both roots and sprouts would be broken off in getting the sets off this material. When I box my sets I put a thin layer of small, sharp clincher ashes in the bottom of the boxes; this acts as a drain and keeps slugs off the tubers. I always grade my tubers, one size in one box, and so on, and plant them in the same order.

Last year I grew a plot of Sharpe's Express out-of-doors. They were planted 3 feet between the rows and 18 inches from set to set in the rows. The only manure they had at the time of planting was a mixture of burnt refuse, old mortar and soot. The crop, when lifted, taking the proportionate size of the plot, was 15 tons to the acre. I had five rows marked for taking the proportionate crop from different-sized tubers. No. 1 row was planted with the smallest, and No. 5 the largest-sized tubers. When the crop was lifted they were as near as possible in proportion to the size of the sets, *i.e.*, the largest sets gave the heaviest crop and smallest sets the lightest. The sets were ordinary seed size from Scotland. *J. G. Blakey, Holmwood Gardens, Redditch.*

NORTH VERSUS SOUTH POTATO TRIAL.

To demonstrate the fact that Potato tubers from a cooler, later district give better results when planted further south than do those grown in the south, I carried out the following experiment. I sowed from a good stock of Midlothian Early ten tubers to be grown in Egypt, ten in France, ten in Surrey, ten in Midlothian and ten in Shetland, in 1915. The results were as follows, from ten sets:—

Egypt, a failure through locusts.	
France, raised August 4	11 lbs. 5 ozs.
Surrey, raised September 1	27 " 4 "
Midlothian, raised September 3	30 " 13 "
Shetland	28 "

I asked each of the growers to send me ten tubers to plant in Midlothian in 1916, and the following were the results, lifted August 30, 1916:—

10 tubers from France ..	produced 14½ lbs.
10 " " Surrey ..	25½ "
10 " " Midlothian ..	32½ "
10 " " Shetland ..	36 "

This is exactly the result I expected, but one does not always realise expectations in this world.

To Mr. T. W. Brown, Director, Horticultural Division, Ministry of Agriculture, Giza Branch, Egypt; Messrs Rivoire and Sons, Lyons; Dr. F. Keeble, Royal Horticultural Society's Gardens, Wisley; and Rev. D. Houston, St. Olaf Mansie, Lerwick, I am much indebted for helping me. *W. Cathbertson, Puddingston, Midlothian.*

COFFEE DISEASE.—It is interesting to learn* that the fungous disease—due to *Hemileia vastatrix*, which destroyed the Coffee industry in Ceylon—although present in Uganda, appears to be well under control.

The Week's Work.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. F. DAVEY,
Abbotts Wood, Godalming, Surrey.

ALPINE STRAWBERRIES are useful in the autumn, and are easily raised from seed sown now. Choose a good stock and sow the seeds in boxes filled with rich soil, pressing them down fairly firm, and placing the boxes in a temperature of about 50°. As soon as the seedlings appear give more air, and prick them out into other boxes or into a frame as soon as large enough to handle. Harden, and plant out in well-prepared positions as soon as large enough.

FIG TREES.—If the Fig trees have been covered, the protective material should now be removed, or growth will start prematurely. The Fig will grow in almost any kind of soil, and is often too vigorous to be fruitful. Rich soil should there-

necessary. The Brown Turkey is the most reliable variety to grow. In some parts of the West and South of England large standards of this variety are grown in the open, and yield fine crops of luscious fruits.

FRUITS UNDER GLASS.

By JAS. HIBSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton, W.

EARLY MELONS.—If the plants raised from the earlier-sown seed have thriven well they should now be fit to transfer into 48-sized pots. Even if planting out be decided upon later, it is well to have the plants as strong as possible. Keep them well up to the light, and in everything aim at a stiff, sturdy growth. Another batch of seed may shortly be sown. Ringleader is a good variety, and so are Hero of Lockinge and Sutton's Scarlet.

FIGS FROM CUTTINGS.—Those who are aiming at an increase in their stock of Figs should watch the cuttings put in during the early weeks of the year. Those struck singly in a thumb-pot should now be fit to transfer to 48-size pots.

FIG. 38.—NYMPHAEA MRS. RICHMOND. COLOUR OF FLOWER ROSE-PINK, STAMENS YELLOW.

(See p. 112.)

fore be avoided, though a little extra nourishment may be given to get the roots well established. After being well started, the root area should be limited. If the trees are seen to be making too much growth and yielding too little fruit, curtail the nourishment at the roots by building a rough wall of old bricks or stone, about 6 feet from the base, filling in the spaces with old mortar rubble. Fig trees often grow and fruit well in paved yards. The trees require very little attention beyond a periodical thinning of the branches, and, as a rule, the older the tree the more prolific it is. In pruning, all the long, gross wood should be cut out, and only the well-ripened and short-jointed wood retained, except for the extension of the tree. These shoots should be laid in and nailed or tied quite straight, leaving room for the large foliage to develop and for new shoots to form for the following season. In many cases even the longest shoots retained will need pruning, especially in the case of extra vigorous ones. When bare spaces exist, prune a strong shoot back to two or three eyes, and when they break, rub off those not required. A great deal of thumb-and-finger work is necessary, and the more is done, the less pruning will be

Keep these young Fig trees in bottom-heat, and give them all the encouragement possible. When potting make the soil quite firm.

SOIL FOR NEW VINE BORDERS.—Where it is contemplated to plant a viney afresh, the proper selection and preparation of the soil is of the utmost importance. The staple material should consist of a fibrous, calcareous, yellow loam, neither too heavy nor too light in texture. Such soil cannot, however, be always obtained, in which case the top spit of an old pasture is the best substitute. On one occasion I had to rely on a local loam that was not quite the ideal material for vines, but the turf was tough and full of fibre, and it answered the purpose very well. If the loam is on the heavy side and approaching clay, it would be well to add sandy or gritty soil to it. Such soil can often be obtained by the roadside in country districts, but it must not be taken from roads that have been dressed with tar. What are usually termed road scrapings form a good material to add to heavy soils. Burnt ballast is another good medium for mixing with heavy soils to keep them open, and I have used it with good results. Charcoal of the size

* Annual Report, 1915-16, Dept. of Agric., Uganda.

of small nuts is of great benefit in all soils, and there should be added a quantity of half-inch bones and old mortar rubble, the last well crushed. These materials should not be used to excess, but in just sufficient quantity for traces of each to be apparent in the soil. Having secured all these essentials, the next process is to reduce the loam in size, say, to about the size of the fist. Next proceed to incorporate the ingredients well together, choosing a dry day for the work. The heap of soil should be covered with a waterproof sheet, to protect it from rains. Turn the compost at least once before it is taken into the vinery, and it should be used in a fairly dry condition; this is an all-important matter, and upon it will depend the well-being of the vines for years to come. The drainage of the border must be perfect, bricks with the mortar still adhering to them being the best choice of material, placing the coarser pieces at the bottom. It may be necessary, if it is suspected that the soil may become waterlogged, to employ drain pipes, in which case the pipes must have a good fall and a suitable outlet. In the case of cold, wet soils, I prefer to have the bottom concreted. I had this done when remaking the vine borders here some years ago after an attack of phylloxera, and it well repaid the extra trouble and cost. The concrete need only be of good lime and sand. It may be urged by some growers that it is not necessary to attend to these preliminaries, and that vines will do well with less trouble. This may be true, but the soil must be of a suitable nature and of a good depth. The vines intended for planting should be treated carefully. I prefer to let them break naturally and plant in the first week in April. The pruning should be done to suit the requirements of each individual vine.

THE ORCHID HOUSE.

By J. COLLIER, Gardener to Sir JEREMY COLMAN, Bart., Gatton Park, Reigate.

MASDEVALLIA.—September is the month usually chosen for repotting these Orchids, but if the work was not carried out at that date the present is a suitable time to supply fresh rooting material. The stronger-growing sorts of Masdevallias, such as *M. Harryana*, *M. Veitchiana*, *M. ignea*, *M. Chelsonii* and *M. amabilis*, that have become pot-bound, may be shifted into larger pots. Do not disturb the roots more than is necessary. Others, which have become bare in the centre, may be broken up and, after cutting away all decaying parts, be potted afresh in smaller pots. *M. tovarensis* will now be passing out of flower, and will commence to make new growth, at which stage new rooting material should be afforded. This Orchid is best grown in shallow pans suspended from the roof rafters. Masdevallias of the Chimerae section should also be given attention at the roots at this period; they grow well in Teak-wood baskets hung from the roof. A layer of Fern rhizomes should be placed over the bottom of the basket for drainage purposes, with a covering of Sphagnum moss. Crocks should not be used, as they hinder the flower spikes from pushing downwards through the bottom of the basket. A suitable compost for all the Masdevallias mentioned is one-half Osunda or A.I. fibre chopped up rather short, and the remainder half decayed Oak leaves rubbed through a half-inch sieve. Add chopped Sphagnum moss, crushed crocks and silver sand. If there is no house devoted to Masdevallias they should be grown in the warmest and shallowest part of the Odontoglossum house.

LAELIAR AND LAELIO CATTLEYAS *Laelia pumila*, *L. rubens*, *L. Gravesiae*, and their hybrids *L.C. Clive* and *L.C. Cornelia*, will be pushing forth new roots from the base of the pseudo-bulbs, and any necessary repotting should be carried out. The dwarf sorts are best grown in well-drained, shallow pans, suspended from the roof-rafters at the cooler part of the intermediate house. The stronger growers, such as *L.C. Epicaste*, should be grown in pots and placed on the stage. After repotting the plants should be given just sufficient water at the roots to keep the pseudo-bulbs from shrivelling, until the young roots are well into the new compost, after which they should receive more copious supplies.

THE KITCHEN GARDEN.

By J. DIXON Foreman Royal Gardens, Windsor.

SALAD PLANTS IN PITS.—Endive and Lettuce plants in cold pits must be freely ventilated during mild weather. Stir the soil between the plants and remove all decaying leaves. During showery weather the lights should be raised, but the plants must not be exposed to drip. The pit containing Endive may be covered with Fern or other material which will ensure perfect darkness at least ten days before the plants are required for use. Continue to plant young Lettuce plants as space becomes available, and make further small sowings for succession.

ASPARAGUS BEDS.—The work of cleaning and pricking over the surface of Asparagus beds should be accomplished with as little delay as possible. While the alleys are being dug some of the finest soil may be spread over the bed and the crowns should be covered with at least 4 inches of fine, rich soil. If new plantations are contemplated the ground should be trenched and thoroughly prepared now, so that it may become settled before the planting season arrives.

PARSLEY.—As soon as the state of the soil will permit, a sowing of Parsley may be made with a view to producing a supply throughout the summer. Parsley is a deep-rooting plant, and requires good, rich soil. The situation should be cool, but not too shady, as, for instance, a border facing east. The plants raised in July last for winter use will run to seed in May or June, and should be removed from the ground as soon as successional plants are ready to take their place. Sow the seeds in shallow drills 18 inches apart and thin to 6 inches apart as soon as the plants are of sufficient size. Another sowing made in July will furnish a supply throughout the winter. If seeds were sown in boxes in January the young plants will soon be ready for pricking into boxes or pans, and should be planted in a wood frame as soon as large enough. Old plants which have been exposed to the weather throughout the winter should be divested of all decaying leaves and the ground carefully hoed. A light dusting of soil may be applied with advantage as soon as the surface of the soil has been stirred.

TURNIPS.—Turnip seed should be sown in a sheltered position with a view to producing roots in quantity at the earliest date possible. Sow the seeds thickly in shallow drills made 1 foot apart. If birds are troublesome, place nets over the seed-bed. As soon as the seedlings are of a suitable size, thin them carefully to 3 inches apart, and work the Dutch hoe between the rows to destroy small weeds. Frequent dustings of finely sifted wood ash will be of great benefit to the crop. Early Milan, Snowdrop, and White Model are suitable varieties for present sowing.

BROAD BEANS.—Long-pod Beans should be planted for succession in rich soil which has been deeply dug and manured in early winter. The seeds should be sown in double drills 2 inches deep. Seedlings of the earliest batch are well through the surface, and the soil about these should be stirred frequently with the hoe. As the season advances, remove the tops of the shoots from the more forward plants to hasten the development of the pods.

PARSNIPS AND ONIONS.—If not already done, take advantage of the first favourable opportunity to sow the main crop of Parsnips and Onions, but unless the soil is in a crumbling condition this work will be better delayed for a time.

CARROTS.—A small sowing of Early Horn Carrot may be made on a warm south border in shallow drills 9 inches apart. The soil should be light and rich. Thin the plants as soon as they are large enough to handle to 2 inches apart in the row. Frequent light dustings of soil in the early mornings will keep slugs in check. A successional sowing should be made a fortnight later.

POTATOS.—In order to obtain new Potatoes from the open it is, as early as possible, plant an early variety in a sheltered position as soon as the soil is in a suitable condition. If the tubers are planted under a south wall in well-prepared soil there will be very little difficulty in protecting the plants from injury by frost. These should be ready to lift ten days earlier than those in open borders. All tubers intended for planting

should be placed on end in boxes and exposed to the light in order for them to make storky sprouts. Sprouted sets should be planted on all available south borders and other sheltered positions by the middle of March, and provision made for their protection from frost either by keeping a quantity of dry Fern at hand or some other light material which can be used quickly for the purpose. Early Potatoes in pits are making rapid progress, and require plenty of ventilation to prevent them becoming drawn; water should also be given freely while the plants are growing actively. Successional plantings should be earthed up carefully before the shoots become too long; if the soil is dry, water it copiously the day previous to earthing up.

TOMATOS.—Sow Tomato seeds, to raise plants for outdoor cultivation, in pans of finely sifted soil. Germinate them on a gentle hotbed, and when the seedlings are well through the soil, place them near the roof glass in a house having a temperature of 60°. As soon as the plants are large enough they may be potted into 3-inch pots, and when these are well filled with roots they may be shifted into 6-inch pots. Strong plants should be available about the third week in May for planting against south or west walls.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcote, Eastwell Park, Kent.

MIGNONETTE.—Plants coming into bloom must not suffer from lack of moisture, or the flower-spikes will be stunted. Feed them regularly, using a little manure or clear soot-water alternately with artificial manure. Stake neatly, using very light sticks of thin Bamboo points, and keep the plants in a light position. Later batches in frames should be encouraged by top-dressings, or transferred to larger pots if specimen plants are desired.

ALLAMANDA HENDERSONII. This is one of the most satisfactory warm house or stove climbers. A healthy specimen, trained on the roof, will give a succession of large yellow blooms for many months. A great point in its favour is that it is rarely attacked by insect pests. Having been given a good rest by keeping the roots dry during the winter, the plant should now be pruned back to firm, well-ripened wood. Do not leave too many shoots; the results are infinitely better if it is trained thinly, and thus well exposed to sun and air. Whether growing in a tub or in a border, the old, worn out top soil should be loosened and removed. Give a good soaking with water, and then top dress with cow-manure and good turfy loam. Beyond a daily spraying, very little water will be required until the plant is growing freely. The drainage must be ample, as when in full growth copious supplies of water are required.

BOUGAINVILLEA. If not already done established plants of Bougainvillea growing in cool conservatories or greenhouses should be pruned and cleared before they start into new growth. This plant succeeds best after a period of rest in winter by withholding water and lowering the temperature of the house. It thrives in varying conditions and in almost any position, and makes a capital plant for the amateur's greenhouse. Specimens succeed well planted in borders at the back of houses and trained on the wires under the roof. In pruning, cut the shoots hard back to well-ripened wood. Those of well-established plants should be cut to within a few buds of the main stems to make spurs, as in the vine. Thin the young shoots to a reasonable number for the space, and allow them to hang in a pendant position to give a natural effect. Syringe the plants daily in fine weather and give the roots plenty of water when in full growth. *B. glabra* is the oldest variety in general cultivation; others of more recent introduction are *B. Cypheri*, *B. Meud* (Chateaubriand) and *B. Sandersoniana*. The last-named variety is very free flowering and blooms profusely in small pots. Pot plants are suitable for decorative purposes; they need constant attention and extra care in watering and feeding. Bougainvilleas may be propagated easily from cuttings formed of the young shoots with a heel of old wood. Make them about 6 inches long, and insert them in sandy soil. Place the cutting pots in a warm propagating frame and keep it closed.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would oblige by delaying in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the Editors. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 41.2°.

ACTUAL TEMPERATURE.—*Gardeners' Chronicle* Office, 41, Wellington Street, Covent Garden, London, Thursday, March 8 (10.0 a.m.): Bar. 29.9; temp. 50.5°. Weather—Sun-shine.

SALES FOR THE ENSUING WEEK.

TUESDAY—

Nursery stock of the Woodlands Nursery, Maresfield, Sussex, by Protheroe and Morris, at 12 o'clock.

WEDNESDAY—

Greenhouses, Hot-water Piping, and Sundries, at 407, Hertford Road, Lower Edmonton, by Protheroe & Morris, at 12 o'clock.
Fruit Trees, Roses, Plants, Lilies, &c., at Protheroe and Morris' Rooms, 67 and 68, Cheapside, at 1 o'clock and 3 p.m.

THURSDAY—

Roses in variety, at Protheroe and Morris' Rooms, at 1 o'clock.

FRIDAY—

Topiary Work, Garden Furniture, and Ornaments, at Protheroe and Morris' Rooms, at 1 o'clock.

It is about thirteen years since Prof. West published his book on *The British Freshwater*

Algae.

Algae, and those of his colleagues who were aware that he had a large work in preparation have been awaiting its appearance with much interest. Unfortunately, it has been delayed owing to the serious illness of the author, but the first volume has now been published*, and the concluding one, we may hope, will not be very long delayed.

The author regards the present instalment as dealing with the biology of the group of plants included in the blue-green and green algae, together with the diatoms. But the ordinary person would probably regard it more as a handbook of the morphology and taxonomy of the plants. Truth to tell, the biology (in the ordinary sense of the term) is rather slender. There are many obvious biological points which have received no treatment at all, and what there is strikes one as being rather scrappy. The author shows his real bent in the grouping of the genera and in the illustrations of related forms. If one desired to criticise the plan of the book adversely, one would say that, for a book of this size, the wealth of examples was rather over-done. The

reader who is not a specialist in the group may easily find himself somewhat oppressed by the number of unfamiliar genera often only adduced as examples, and seldom more than briefly described. But then, it is no book for the beginner. To anyone who has studied the group, it provides a valuable presentation of a great range of facts, and it will certainly take its place as a solid contribution to the literature of this important group of plants.

We note some errors and omissions, but such are almost inevitable in a book of this kind. Thus, in speaking of the Red Snow plant no mention is made of the interesting fact that the alga will turn red whenever it is grown under conditions of nitrogen starvation, and will rapidly turn green when a source of nitrogenous food is supplied to it.

The account given of the cytology of *Spirogyra*, as elucidated by Tröndle, is incorrect. Tröndle clearly showed that, as might have been anticipated, the three supernumerary nuclei in the germinating spore degenerates, and that the eoaescence described by older authors rests on mistaken interpretation.

We note that Prof. West seems to adhere to the view that reduction in the number of chromosomes is necessarily connoted with the gametophyte stage of the life history, although the example of the brown Seaweeds (*Fucus*) clearly shows that the sexual organs may arise on what, if consistent, he would have to term the sporophyte.

But these things do not greatly detract from a valuable work, and the author may be congratulated on having made an important contribution to science.

CONVERTING PASTURE TO ARABLE CULTIVATION.—Although treating the subject from an agricultural point of view, the account* by Mr. ARTHUR ASHES of the means of overcoming some of the difficulties attending the conversion of pasture to arable land should be read by gardeners engaged in this work. The need for consolidating the freshly-broken turf, the risks of damage from insect pests, and manurial treatment are all dealt with.

ALLOTMENTS AT LEEDS.—The demand for allotments at Leeds is very great. The Parks Committee has received 950 applications, and Mr. ALLSOP, the Parks Superintendent, under whose charge the allotments are made, hopes to supply every applicant with a plot. In addition to this work, he is supervising the cultivation of 60 acres devoted chiefly to Potatoes, Oats and Peas. Seed Potatoes of the varieties Eclipse, King Edward, and Arvan Chief, fertilisers and tools are supplied to allotment-holders at cost price, and a leaflet on Potato cultivation has been prepared for their use.

THE FOOD SUPPLY.—Everyone interested in the understanding of food problems should study the Report on the food supply of the United Kingdom drawn up by a Committee of the Royal Society at the request of the President of the Board of Trade.

PRICES OF SULPHATE OF COPPER.—An arrangement has been made by the Board of Agriculture with manufacturers of sulphate of copper, whereby sulphate of copper will be sold for home consumption in the United Kingdom at the price of £50 per ton, in quantities of not

less than 2 cwts., delivered free on rail at maker's works, in maker's bags, nett cash with order. The price charged by dealers and merchants other than manufacturers is not to exceed 6½d. per pound. These prices are to apply to sulphate of copper, blue vitriol, or blue stone of a standard quality of not less than 98 per cent. purity. They do not apply to sulphate of copper sold for export. The prices stated above are below the market prices recently ruling.

HOLD FAST TO YOUR GARDEN CATALOGUES.

—Horticulture, already very sorely tried, will now have to face a new difficulty owing to the Order that forbids the issuing of catalogues by post, except in response to request. May we suggest that it would be as well for all amateurs and gardeners to keep their present lists for reference? In the circumstances, nurserymen and seedsmen may not deem it prudent to print the bulb, herbaceous, Rose, Coniferæ and fruit catalogues usually distributed in autumn and winter.

SIR JOHN T. DILWYN LLEWELYN, BART.

Horticulturists will learn with deep regret of the loss sustained by Sir JOHN LLEWELYN in the death of his wife, on the 5th inst., at Penllegar, near Swansea. Sir JOHN LLEWELYN is a distinguished personality in the gardening world, and his beautiful gardens at Penllegar bear testimony to his enthusiasm for plants, and especially for choice trees and shrubs. He is a former member of the Council of the Royal Horticultural Society, and was for many years the President of the Horticultural Club. Ever ready to forward the interests of horticulture, he served as President of the National Potato Society, and is a vice-president of the National Chrysanthemum and National Carnation and Picotee Societies, and Patron of the National Dahlia Society. In 1907 he was awarded the Victoria Medal of Honour.

WAR ITEMS.—The American horticultural Press records the death at the front of Mr. HAROLD B. BRIDGET, florist, of Seattle, Washington, U.S.A., with the English Army. Mr. BRIDGET, who was only 52 at the time of his death, being an Englishman, joined a Canadian regiment and went with it to France.

—Second-Lieutenant HERBERT DENNIS PHILLIPS has been killed in action. He was the second son of Mr. F. G. PHILLIPS, of Wulverle, Otton, and was 26 years of age. Mr. PHILLIPS, whose death was instantaneous, was a keen trade grower of Daffodils, a member of the Horticultural Club, and a member of the committee of the Midland Daffodil Society.

—Private T. S. PAGE, of the Worcester-shire Yeomanry, whose death has occurred in action, was formerly employed in the Earl of Derby's gardens at Witley Court.

—Private ALLEN PARKES, reported killed in France, was gardener to Mr. J. D. HARWARD, ex-Mayor of Stourbridge, Winterford, Chaddesley Corbett. He was 51 years of age.

THE LOCAL SOCIETIES.—Both before the beginning of the war and since, Elstree Horticultural Society, of which the Hon. VICARY GRUBS is President, has been doing good work in promoting horticulture, especially with regard to the cultivation of vegetables. The membership is a large one, and until recently an annual show was held. In place of the usual exhibition, prizes are now offered for the best Potato crops, growing crops, and vegetables. Allotments are being provided all over the district, and practical members are given much by way of giving advice. Lord ALDENHAM has provided allotments, free of charge for the time being, adjoining Elstree village, and the land is now being broken up and cultivated. Between 30 and 40 tons of seed Potatoes have been purchased and distributed by Mr. W. J. PRITCHARD, secretary of the society. A depot has been established at Elstree for providing fresh vegetables and fruit for the Fleet.

* *Algae*. Vol. I. By G. S. West, M.A., D.Sc., Mason Professor of Botany in the University of Birmingham, Cambridge University Press, 1916.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE BLEEDING OF VINES.—W. J. S. (p. 104) could stop the bleeding of his vines by the following method. Get a small Potato, cut it in half, make an incision rather smaller than the wood, and then push it on nearly up to the bud. I have seen this plan very successful after other methods had failed. W. Chitty.

HYBRIDISING WATER LILIES. In connection with Mr. Hudson's exhibit at the last meeting of the Horticultural Club of lantern slides of Marliac Water Lilies, it is of interest to remember that Sir Joseph Paxton called attention sixty-five years ago to the desirability of British Horticultural experiments on the hybridisation of Nymphaeas.

He wrote as follows (*Gard. Chron.*, July 10, 1852):—"How is it that aquatic plants are seldom or never brought under the influence of hybridism? They are objects of great beauty, are, and always must be much in request, and appear to be just as submissive to man as other plants. Their constitutions may certainly be affected by crossing quite as much as the Rhododendron. Yet, while the tender crimson species of the Indian Rhododendron are brought to act upon the hardy pale faces of the United States, the delicate white Water Lily of our rivers is left to wild nature in the presence of the most glowing tints possessed by her tropical kindred. It may be said that there are physical difficulties in the way of crossing Water Lilies. We grant it. The yellow Nymphs are not likely to breed with the white and blue and crimson Nymphaeas, and perhaps Victoria may refuse all alliance with either. But then it is the same everywhere: a Currant will not breed with a Gooseberry, nor an Apple with a Pear. Nevertheless, Gooseberries find kindred blood among Gooseberries, and Currants among Currants; and why may it not also happen to the Nymphaeas themselves? This sort of crossing is certainly possible. It has been done.

"Some years since mules were obtained in the horticultural garden between the tender blue Nymphaea of the Cape of Good Hope and the hardy white one of England. But owing to neglect they were allowed to perish, and that experiment came to nothing." He then describes *Nymphaea Devonensis*, which was produced by crossing *N. rubra* with *N. Lotus*, and adds:—"Let us hope that this example will not be thrown away. There can be no difficulty in operating to any extent upon the white *Nymphaea*, which we should take for the mother of the brood that it is hoped will come." The brood came, but at the hands of M. Marliac. Frank Crisp.

THE LATE M. ETIENNE SALOMON. I was sorry to read on p. 103 of the death of this famous French vine-grower, who spoke excellent English. The last time I met him was at that charming little reunion at Ledoyen's on the occasion of the Schneider banquet in Paris in 1907. Messrs. E. Salomon et fils were prominent exhibitors of vines and Grapes, especially at the Paris Autumn Shows. C. H. P.

SUGAR BEET FOR PRESERVES. Mr. T. C. Deans, The Council School, Long Crendon, Thame, has advised in the daily press the use of Sugar Beet in making jam. He says, "Mixed with the fruit and well boiled, not only is less fruit required, but practically no sugar is

needed. In the case of very sweet fruits like Strawberries no sugar at all is needed provided that the jam is boiled well and is not kept too long. The Beet should be boiled separately and the pulp added, the proportion varying from one-half to two-thirds, according to the ripeness and sweetness of the fruit." In view of the shortage of sugar it would be of much interest and real value to know if any readers have tried Sugar Beet for this purpose, and what is their experience with it for preserves. T. W. Bolus, *Mount Stewart Gardens, Co. Down.*

HOME-GROWN AND FOREIGN BULBS.—In any consideration of the future of the British bulb-growing industry, the fact that there are bulb merchants and flower growers who are not necessarily bulb-growers must not be overlooked. Nor should it be forgotten that when prohibition Orders are withdrawn from foreign bulbs duties may be imposed upon those classes of goods which may be grown in this country. If such duties are imposed upon imported bulbs at the last moment, this may be done without the benefit of the advice that should be forthcoming

Management Committee for 1916, of which the following paragraphs are extracts:—

EXTRACTS FROM THE REPORT.

The more stringent lighting regulations issued last autumn have not tended to encourage attendance at evening meetings in town, and for this reason the programme of the club was cut down.

The annual general meeting took place on February 22, when the president, Sir Frank Crisp, Bart., presided. The social dinner which generally follows this meeting was omitted.

On the kind invitation of the president about five members visited Firar Park on June 22, the date of the annual outing. On former occasions our visits to the president's famous gardens had taken place in July, and the earlier time was chosen last year in order to give the visitors an opportunity of seeing more of the rock-garden plants in flower.

On October 10, Mr. Reginald Farrer gave an account of his recent explorations in Tibet, and described many of the interesting and beautiful plants he discovered there.

The way in which the members have supported the club during the war is most satisfactory. There have, nevertheless, been a few resignations and some deaths. Mr. J. Gomes Rowley, whose death occurred during the year, was a member of the club. The committee has induced Mr. W. A. Biney to succeed him in that office.

FIG. 39. NYMPHAEAS IN BLOSSOM. *N. ALBA ROSEA* IN FOREGROUND, *N. ELLISIANA* IN BACKGROUND.

(See p. 112.)

from the trade. It is essential, therefore, that this question should be considered at once, so that terms acceptable alike to the trade and the Government may be drawn up. In the event of any duty being imposed upon imported bulbs, the basis of weight rather than numbers should be adopted. C. K.

SOCIETIES.

HORTICULTURAL CLUB.
ANNUAL MEETING.

FEBRUARY 27. The annual meeting of the members of the Horticultural Club was held in the Club Room at the Hotel Windsor, Westminster, on the 27th ult. The chair was occupied by the president, Sir Frank Crisp, Bart., and the attendance of members was satisfactory. Mr. R. Hooper Pearson, hon. secretary, read a letter from Mr. Harry J. Veitch, regretting his inability to be present owing to a severe chill. Mr. Pearson then read the report of the

The number of members at the present time is 120 (including 4).

The sum of £190 has been invested in the War Loan making the club's investments up to £600 (including £400). The sum of £50, promised to the War Horticultural Relief Fund, has been paid.

The president congratulated the members on the satisfactory nature of the report and the sound condition of the finances. The motion was seconded by Mr. R. W. Wallace, and carried unanimously. The next business was the election of the Management Committee. The members of the committee for 1916 were unanimously re-elected *en bloc*, their names being as follows: P. Rudolph Barr, W. A. Biney, E. A. Bunyard, W. B. Cranfield, W. Cuthbertson, H. R. Darlington, Chas. T. Draney, W. J. Jofferies, H. E. May, George Monro, George Paul, J. F. McLeod, C. E. Pearson, E. Finches, and Edward White.

LECTURE ON WATER LILIES

About forty members and friends of the Club assembled for dinner at 6.30, and afterwards Mr. James Hudson gave a lecture on Water Lilies, illustrated by coloured lantern slides. Mr. Hudson said that his interest in Water Lilies

begin sixty or more years ago, when he was still a schoolboy, but it was about twenty-five years ago that he first took up their cultivation seriously, when he purchased a dozen of the earliest of M. Latour-Marliac's hybrids for 52s. The varieties included *alabata*, *chromatella*, *rosea*, *carnea*, *N. odorata rubra*, *N. o. rosea*, *N. o. exquisita*, *N. o. sulphurea*, *N. pygmaea helvola*, and *N. flava*. His experience with these varieties was that all were hardly except *N. flava*. Mr. Hudson said that M. Marliac's work in hybridizing Water-Lilies had enriched our gardens with some of the most beautiful of plants. He described M. Marliac's nursery at Temple-sur-Loire as an ideal place for Water-Lilies, containing as it did a warm spring, the water of which never fell below 55° Fahr. Even the tropical species such as *N. stellata* and *N. zanzibarensis* luxuriated there, whilst the *Nelumbium* was also quite at home. M. Latour-Marliac senior spent fifteen years in hybridising in the early days of the nursery, but unfortunately lost his whole stock, and was obliged to begin afresh, this time with the happy results well known to all Nymphaea-lovers. The late Herr Froebel, of Zürich, had also experimented in the raising of seedlings, and to him we owe the beautiful *N. Froebeli*. Mr. Dreer and others in the United States had likewise been successful in raising several meritorious hybrids. The list of hybrids had now become a formidable one, and a beginner would find it difficult to select a list of fifteen or twenty. During the spring of 1916 the plants at Gimmersbury House had been overhauled, and only the choicest retained. The best specimens of these had been photographed in colours, and it was from these portraits that the slides he was now using had been prepared by Mr. R. A. Malby. The varieties were as follows: *Gladstoniana*, *Moyreana*, *pygmaea*, *helvola*, *collosa*, *suavisima*, *caroliniana*, *rosea*, *Marliacea*, *rosea*, *formosa*, Mrs. Richmond, *Incida*, *Seignouretii*, *sanguinea*, *Masoniella*, *Galatee*, *Necton*, *Jas. Brydon*, *Jas. Hudson*, *Escarboucle*, *Listeri*, *gigantea*, *Hudsoniana*, *Attraction*, *atrapannus*, *W. Falconer*, and *Compteur*. It was well known that the habit of Nymphaea flowers was to expand in sunshine, and close at dusk, but he had often noticed that on bright moonlight nights in September the blooms would be fully expanded. He issued a word of warning to would-be Nymphaea growers against allowing water-fowl to have access to the plants, on account of their destructive habits, swans, ducks, and moorhens being specially troublesome. Certain good hybrids were liable to fail through exhaustion, and he had lost in this way *N. odorata rosea*, *N. o. exquisita* and *N. gloriosa*. Most of the hybrids were the latter for occasional division, the best crowns only being replanted. Indeed, division was necessary in the case of certain hybrids, or their growth would become too crowded. For very vigorous hybrids he would recommend water up to 9 or 10 feet in depth; those which needed such treatment made is evident by their very long petioles, and leaf-stalks.

In the course of discussion after the lecture, Sir Frank Crisp remarked that he had not been aware that Water-Lilies required such deep water; he had certain varieties growing in about 2 feet, and they were perfectly successful. The foliage was freely thinned. Mr. R. Farrer was surprised that the lecturer had not referred to *Nelumbium speciosum*, which is perfectly hardy. He had seen it growing and flowering freely in the rivers from Ceylon northwards to Japan and to the centre of China. Sir Frank Crisp said that he had grown it for ten or fifteen years, but had never been able to induce it to flower. Mr. R. W. Wallace said that he considered Nymphaeas to be amongst the easiest of all plants to grow. The plants should be frequently divided and replanted in hard mud, placing a mulch around the crown every spring. There was, in his opinion, no finer variety than *Escarboucle*. If he were to grow six only, he would select them as follows: *Gladstoniana*, *Marliacea rosea*, *Escarboucle*, *William Falconer*, *James Brydon*, and Mrs. Richmond.

CROPS AND STOCK ON THE HOME FARM.

BARLEY.

BARLEY is one of the most useful of farm crops, and the meal is invaluable for fattening pigs, especially when mixed with steamed or boiled Potatoes. For poultry, too, Barley as meal and as whole corn is wholesome. When grown sufficiently well to be used for malting, Barley is a particularly profitable crop, and the straw is good for spreading in cattle yards, especially in the lambing fold, as it does not twist around the legs as the longer Wheat or Oat straw does. By Strawberry growers, too, Barley straw is much appreciated for "bedding" the plants, to prevent the fruit from being soil splashed. Barley can follow a Wheat crop if the land is in good condition. In some counties Barley follows Rape, Turnips, or Kale, eaten off by sheep; in others, it is sown on a clover or grass ley, ploughed and pressed in the autumn. The chief point is to avoid too rich land, as the straw is liable to be laid by heavy rains. If this happens before the straw is ripe, it does not rise again. Barley is the quickest of all cereals to germinate, and when the ears are lying on the ground the corn quickly "sprouts." A light, loamy soil, or overlying chalk, is the best for Barley; heavy soils, especially clay, are unsuitable. Preparation of the soil is important. A fine surface tilth is imperative, produced by autumn ploughing, with repeated stirrings of the soil at seeding time by the plough or cultivator, and the breaking of all surface clods by the harrow or roller. Sowing should be done in fine weather; the middle of March, if fine, is a good time. Drilling is the best method of sowing; when the seed is buried at irregular depths part of the crop ripens early and some late. Chevalier and Archer's Stiff Straw are good varieties. Three bushels of seed per acre is ample. After sowing, harrow sufficiently to bury the seed, and use the roller if the surface is rough. Even growth is all important, and it cannot be obtained without a good tilth.

THE COTTAGER'S PIGS.

Cottagers and smallholders who do not keep pigs are advised to do so if the food can be bought reasonably. To the cottager the keeping of pigs has three advantages—bacon for his family, pigs to sell, and manure for his garden.

We hear much about feeding pigs upon house refuse, commonly known as swill. I fear some persons may foster the idea that, by collecting such material as Potato peelings, Cabbage leaves, scraps of meat, bread and liquor in which meat of any kind has been boiled, especially bacon—they are providing the pigs with the major portion of their food. I would strongly advise no one to attempt to keep small pigs on such rations without adding quantities of other food such as sharps, bran or barley-meal. Such refuse may serve to feed a sow, with but a small quantity of bran added, until she has a litter of young pigs, when improved rations should be served her. The serious objection to the indiscriminate use of swill is when it contains the "washing up" water heavily charged with common washing soda and pieces of soap, which in themselves act as an irritant to the stomach and intestines. The proper method of dealing with house refuse generally is to lail the matter together, afterwards adding meal liberally. The period March to April is a good time to start with pigs eight weeks old. Earlier, they are liable to suffer from cold, especially when but one or two are kept together. Clean, dry straw in their sleeping quarters is much appreciated, as warmth is necessary. Some persons use only leaves for litter. A few collected in March or April, when quite dry, are safe, but those collected in the autumn while containing much sap quickly heat by the warmth of the pigs when huddled together, and when the animals are afterwards exposed to the air they feel the cold severely. *E. Molynous.*

PUBLICATIONS RECEIVED.—Food Producton in Cottage and Allotment Gardens. By S. Hoskin. Bulletin No. 79, The West of Scotland Agricultural College, Glasgow.—*The Worker's Garden.* By Gerald W. Butcher and Cyril Harding. (London: The Vacant Land Cultivation Society, 14, Buckingham Street.) Price 6d.

Obituary.

CHARLES WINN.—We learn with regret that Mr. Charles Winn, The Uplands, Solly Hill, Birmingham, died on the 1st inst., the eve of his 33rd birthday. At one time Mr. Winn grew *Oxchids* extensively and well, and during recent years he was very successful with Show and Alpine *Auriculas*, which he exhibited at the spring shows of the Midland Auricula and Primula Society at the Edgbaston Botanical Gardens.

ANSWERS TO CORRESPONDENTS.

CYANIDING FOR MEALY BUGS: N. and S. We think it probable that the cause of your failure lies with the strength, or purity, of the articles used, or perhaps both. We notice that the phosphoric acid used is 1500, whilst that generally used is 1750. $\frac{1}{2}$ oz. cyanide, $\frac{1}{2}$ oz. acid, and $\frac{1}{2}$ oz. water per 1,000 cubic feet will usually kill black and white fly, but only, of course, if the gas is generated, which we think in your case it probably was not. We may say that it is not easy to buy sodium cyanide 130 per cent., and equally difficult to get phosphoric acid at the proper strength.

FERTILISERS FOR BROCCOLI: A. C. A nitrogenous manure is the most suitable fertiliser for this crop, and this is not included in those you mention. You could use the superphosphate at the rate of 2 oz. to the square yard and the kainit 1 oz. to the square yard when the ground is dug after the Lettuce, and dress with 1 oz. of sulphate of ammonia when the Cauliflowers are planted.

MOSS ON A HARD TENNIS COURT: D. L. Seeing that the court is of brick and sand, with no turf, you can use a strong weed-killer to destroy the moss.

NAME OF FRUIT: Dignar. Apple Cellini.

NAMES OF PLANTS: Rec. 1, *Cestrum* (Habenroth among) fasciculatum; 2, *Acacia* sp., probably *A. saligna*. — S. F. *Gyneryum argenteum* (Pampas Grass).

PEAS AND BEANS FOR WINTER USE: H. B. and E. H. N. Dried Peas for winter use should be harvested in exactly the same manner as if required for seed purposes. The plants are best left on the sticks until the pods are thoroughly well ripened, and in autumn an opportunity should be taken of dry weather to take them indoors to be threshed. Should the seed, owing to unfavourable weather conditions, be at all damp, it should be spread out in an airy place to get thoroughly dry. Unless this care is taken the seeds will not keep in good condition. Of course, there is a great deal of difference in different varieties, some being specially suitable, boiling tender and retaining the colour and flavour. It is also, of course, important that care be exercised in cooking. The Haricot Beans that are usually sold for winter consumption come from abroad, and it is doubtful if many of them could be successfully ripened in this country. Three varieties which cook best and can be ripened in normal seasons here are *Excelsior*, a light brown Bean; *Lightning Runner*, a very tender white Bean; and *The Car Runner*, a larger white Runner Bean.

RICHARDIAS: G. A. K. The basal internal portions have been attacked by the bacterial "soft rot." There is also present on the surface the grey "mould," *Botrytis cinerea*. No remedial measures are likely to save the plants attacked by the bacteria, and the affected plants should be destroyed promptly. — D. H. C. The brown discoloration of the spathes is not due to the attack of any organism. The appearance suggests scorching, or a deposit from water or dew.

REMARKS.—The first consignment of Primroses for the season reached the market this week. Home-grown Daffodils and Narcissus poeticus are less plentiful, and there is only a limited supply of Lilium longiflorum, but Richardson (Arams) are more numerous. There is a plentiful supply of Carnations, and prices are lower. Roses are becoming more numerous; fine blooms of Richmond, Sunburst, and Ladylove are offered for sale. There is also a good selection of Darwin Tulips, which are selling freely. Lily of the Valley is arriving in good condition and is more plentiful and cheaper. Larger consignments of cut blooms are arriving from the Channel Islands, and they are much lower in price. French flowers consist chiefly of Acacia (Mimosa), Violets, and Anemones. A few baskets of white Stock and yellow Marguerites had a ready

sale. It is rumoured that the last consignment of these flowers may arrive this week-end, but nothing definite is known.

REMARKS.—The principal supply of Apples from home growers is of the variety Bramley's Seedling, and there is a good quantity of colonial Apples, principally howell Pines, Melons, and No. 100's. The supplies of English Grapes are shortening, but the Cape and Almeria kinds are on sale. There are no Tomatoes from Tenerife. The following forced vegetables are available: Dwarf Beans, Asparagus (English and French), Chicory, Seakale, Mushrooms, and New Potatoes. French Salads are arriving in limited quantities. The commonest green and red vegetables are becoming scarcer each week. F. H. R., Covent Garden Market, March 7, 1917.

Potatoes.

REMARKS.—The large demand for Potatoes is in excess of the stocks in London. Edward J. Neaborn, Covent Garden and St. Pancras, March 7, 1917.

THE WEATHER.

THE WEATHER IN SCOTLAND.

The spell of bright, cold weather which obtained during the first half of February was followed by a sequence of dull, foggy days lasting almost to the end of the month. There was very little rain, the gauge only collecting a total of 1.25 inch. This was distributed over six days, the heaviest fall, of 1.02 inch, being on the 20th. The sun shone on 20 days, yielding 37.2 hours for the month, giving a mean of 3.1 hours, and a percentage of 31. During the month the barometer varied from 30.81 inches on the 9th to 29.65 inches on the 3rd, with a mean of 30.157 inches. The mean temperature for the month, giving a mean maximum of 41° and a mean minimum of 31°, the mean range being 11°. On the 28th the highest maximum, of 50°, was reached, and on the 6th the lowest minimum, of 17°. Thus the absolute range was 33°. The lowest maximum was 39°, on the 4th and 6th, and the highest minimum 39°, on the 28th. On 17 days the temperature fell to the freezing point or below. There were 22 days of ground frost, the thermometer falling as low as 13° on the 6th. The relative humidity of the air was 87 per cent. Soil temperature at a depth of 1 foot fell from 34° to 33°, and then rose to 36°. Prevailing winds were westerly. A display of aurora was observed on the 15th. James Malloch, St. Andrew's Training College Gardens, Kirkton of Mauns, near Dundee.

SWEET PEA
 (Autumn Sown. Cold Crown.)
 and **TOMATO PLANTS**

Our Great Specialities,

NAB Dealers of the Sweet Pea should send for our catalogue. It contains 90 Varieties, including 20 Novelties. These are a selection of the "Cream," and we honestly believe that there has never been offered as plants such a comprehensive Collection of First-class varieties.

THE EDITORS of many Gardening Papers have commended our selection.

We cannot too strongly emphasize the fact that these plants are Autumn Sown and Cold Crown. There is a vast difference between such plants and those raised in the Spring in heat.

MY POTATO PATCH IN 1916: AND SOME NOTES ON THE "MYSTERY" MANURES.

TWO patches are used in alternate years for maincrop Potatoes and general crops. For the latter a good dressing of stable manure is used, with here and there artificials as may be indicated, for the former only a heavy dressing of dead leaves and leaf-mould is applied as a foundation for various experiments. Since this routine has been adopted, the yield of Potatoes per plant has progressively increased, thus the patch in 1914 gave a grand average of 2.05 lb., and in 1916 3.41 lb. per plant, whilst the patch used in 1915 has risen to 5.3 lb., with maximum 6.7 and minimum 4.0 lb. per plant per row. Distance between rows 30 inches; between sets, 18 inches. As it was anticipated that my presence might be required elsewhere, no very elaborate system of trials was started, however, I had the opportunity of weighing the crop before leaving home.

One part was dug after the manner described in Gardeners' Chronicle, March 4, 1916, page 136 namely, besides ridging, which has been done every autumn for five seasons, the bottom of each furrow was treated as in trenching. Thus the third spit in its loosened condition is only one spit deep from the depressed surface, and having no great weight above, it is more patent to the air than in ordinary trenching, wherein it is buried at once under two spits. The average per

plant on this area, excepting rows with special treatment, was 4.04 lb., against the control part (only ridged and not manured), 3.36; the grand average of the whole crop was 3.44 lb.; the variety Sutton's Superlative.

Professor Bottomley kindly supplied me with some of his Humogen; the new supply did not arrive in time for putting in at planting time, so some of the previous year's supply was used. Also, a small quantity of "Rito" was kindly supplied by the proprietors. The results were:—

RIDGED ONLY.

Table with 2 columns: Treatment, Yield per plant. Rows include old dry Humogen, Rito, New moist Humogen, and Control rows.

RIDGE TRENCHED.

Table with 2 columns: Treatment, Yield per plant. Rows include New Humogen, Soil + sulphate, Control rows, and Grand average.

It will be seen that there was some apparent beneficial effect of Humogen, except on the "ridge-trenched" area, whilst the "Rito" showed depression almost to the minimum yield of any single row. The beneficial effect of the yeast and lime may be noted, though it is not a manure that can be ordinarily obtained; no doubt part of the influence was due to the lime, a matter that will be again mentioned in considering the effect of the "mystery manures" on other crops.

Other Crops.

Humogen and Rito were also tried on some other crops.

WINTER ONIONS.

Table with 2 columns: Treatment, Final Crop. Rows include Control, Humogen, Rito, and Grand average.

SPRING SOWN ONIONS.

Table with 2 columns: Treatment, Final Crop. Rows include Control, Humogen, Rito, and Grand average.

SHALLOTS.

Table with 2 columns: Treatment, Final Crop. Rows include Control, Humogen, Rito, and Grand average.

CARROTS.

Table with 2 columns: Treatment, Final Crop. Rows include Control, Humogen, Rito, and Grand average.

LEAFY ROOTED PARSNIPS.

Table with 2 columns: Treatment, Final Crop. Rows include Control, Humogen, Rito, and Grand average.

Celeriac. This crop was not ready for harvesting on my departure. Half the patch was treated with Humogen, 25 grams to each plant; subsequently they were watered with a weak tea-coloured infusion of Humogen instead of plain water. In August half of each part was given a good sprinkling of lime. On October 30 it was noted that the Humogen patch was the most vigorous, and particularly so where no lime was given. It was hardly attacked by fly; on the other hand, the control part, especially that with no lime, was far less luxuriant and badly infested with fly.

For a further purpose, a few plants of "Field Beets" (Mangel Wurzel) were grown from seeds kindly supplied by Messrs. Sutton and Sons. Half of these were given 1 oz. of Humogen at the time of sowing, and a further dose later. Of Sutton's Tankard:

Control roots taken at 100, yield with Humogen... 113
Control leaves taken at 100, yield with Humogen... 114

Sutton's Sugar—

Control roots taken at 100, yield with Humogen... 165
Control leaves taken at 100, yield with Humogen... 140

REMARKS UPON THE ABOVE RESULTS.

After the experience of the previous year, the effect of the Humogen treatment, particularly upon Potatoes and Onions, was not in accordance with anticipation. And it seemed clear that there must be some factor whose presence or absence affected the influence of the peat products, Chittenden (R.H.S.J., XLI., 1915, p. 320 especially, and again Gardeners' Chronicle, August 12, 1916, p. 80) has not been able to show any marked benefit from the use of Humogen; in the latter reference he expressly states that the soil was a poor sandy one. He also tried the effect of adding lime during growth; this caused depression when used alone, and, speaking generally, it did not enhance the yields where Humogen was also used. Unfortunately, he does not give the carbonate analyses of the soils. Having had nearly 50 per cent increase with Humogen in 1915 with Onions, the depression found on weighing the thinnings was especially striking, and it seemed worth while to investigate the carbonate contents of the patches. Four nine-inch samples were taken from each part, and three twenty-gram* lots of each were tested, after a preliminary boil with distilled water to drive off any free CO2 that might be present. The control patch gave 0.48 per cent., the Humogen patch 0.33 per cent., and the Rito patch 0.26 per cent. of carbonate reckoned as CaCO3 (loss of CO2 by action of peat products).

It is regrettable that a further sampling could not be done at the time of the final cropping, when the conditions may have changed somewhat. Furthermore, an isolated observation cannot be taken as proof; but when consideration is given to those plants which prospered particularly—viz., Celeriac and "Field Beets"—it appears that these are plants which are not particularly exigent in the matter of carbonate of lime. Mr. Chittenden's trials have shown that late additions of raw lime do not solve the problem, and it is to be hoped that in further experiments, soil, in which a lime addition has been allowed time to mellow, will form one of the control plots. Moreover, the carbonate analyses of the trial plots will not be without interest, and may help to unravel the discrepancies which have been recorded. The fixing or precipitating power of lime or its carbonate on soluble humus is well known, and some such fixation may be necessary for subsequent utilisation. In some experiments with soluble humus it was found that magnesia had comparatively slight precipitating power; which leads one to the idea that excess of magnesia and paucity of lime may lead to the loss of humic matter by leaching out, and consequently impoverish the fertility of the soil from loss of this important constituent H. E. Durham.

VEGETABLES.

A CROPPING PLAN

The plan reproduced in fig. 40 shows the system of cropping to be followed in the kitchen garden at Moreton Paddox, Warwick, in the forthcoming season, as set out by the gardener, Mr. B. H. Martin. Most gardeners draw up a scheme of cropping each season, for it has obvious advantages, but only an expert draughtsman such as Mr. Martin could be expected to make so complete a plan to scale, which is in-

the furrow of the first crop, the second crop to receive a generous amount of short manure. The bush and small fruits are planted in square or parallelogram plots for easy and economical netting. Our correspondent states that the same rule applies to the permanent crops such as Rhubarb, Sea Kale, and Globe Artichokes, because the trenching necessary for these is best done in square breadths. The site for the Asparagus beds is the best drained and lightest soil, and is removed from trees. The central squares are so arranged that crops can be rotated from 1, 2, 3, and 4 in successive seasons.

cultivator. For main crop varieties I recommend Prolific (a strong grower), Carter's Royalty (medium), King Edward VII., a good all-round variety, also The Factor, which is one of the best late-keeping Potatos. It must be borne in mind that it is possible to grow two crops of Potatos in one year in the open air. Therefore the thing to aim at is the greatest possible production of Potatos for the year ahead of us. It is not difficult to accomplish, nor is it, as some may contend, bad practice. The four essentials are: (1) That the second crop must be planted during the first week in

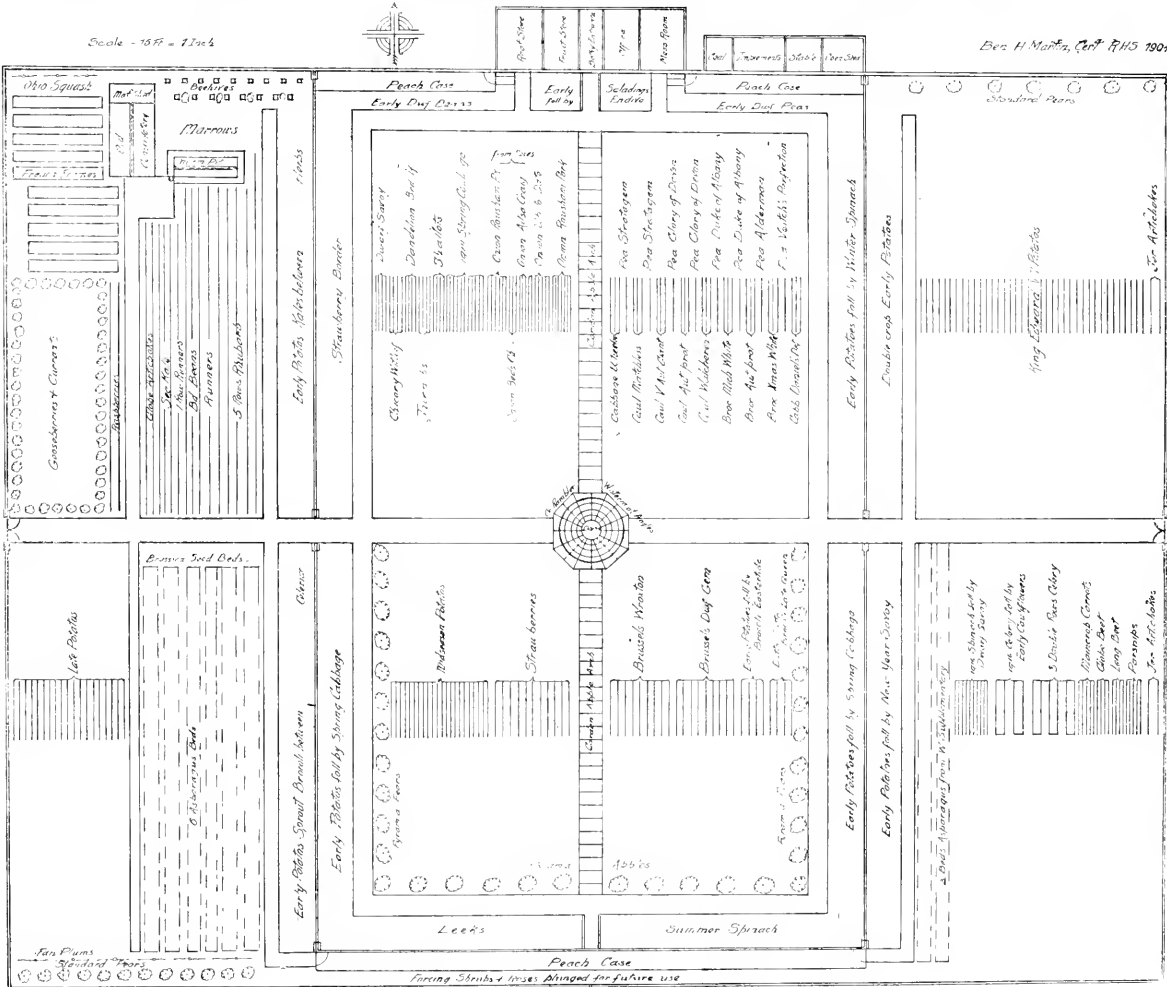

FIG. 40.—PLAN OF THE KITCHEN GARDEN CROPS AT MORETON PADDOX, WARWICK.

tended to be hung in the men's mess room for daily reference. It is not claimed that the cropping is perfect, particularly with regard to the rotation of the crops, the Brassicas being too scattered. Mr. Martin was requested by his employer early last year to crop only with Potatos, but in May it was decided to produce all the varieties of vegetables possible. The change resulted in confusion, which it has not been possible wholly to correct this season. On one border the North-country practice of cropping twice with Potatos in the same season will be followed, care being taken to plant the second crop on the site of

and give a complete change of ground to the different kinds of vegetables.

PLANTING FOR THE MAIN CROP OF POTATOS.

GIVEN prepared seed and well-tilled land, then comes the operation of planting Potatos. With regard to the time of planting, the main crop much depends upon the locality, but mid-April, generally speaking, would be soon enough, planting the sets 15 inches asunder and setting the rows 2 feet to 3 feet apart. Much depends upon the habit of growth of the variety, a knowledge which is soon gained by an observant

July: (2) that vigorous seed must be used, preferably Scotch; (3) that the sets must be sprouted before planting; (4) that attention must be paid to spraying. The tubers intended for planting to produce this second crop must be kept in as cool a place as possible, provided frost is excluded. In May or early June they should be placed in the open air to complete their sprouting. Sturdy shoots, about 2 inches or less in length, will then be produced by July. These, if planted in rich soil, will quickly appear above the ground; this method is a most powerful factor in securing this second crop.

As soon as the growths are a few inches high, draw up to the young tops some soil on both sides, even to covering them, when frost threatens. The Potato is a plant very susceptible to frost, but immunity from harm may be gained at the cost of a little labour. Subsequent stirring of the soil between the drills for the purpose of aerating and loosening the ground will be necessary, together with hand weeding, and followed by a final moulding before the haulms have attained an inconvenient size for working, will complete the treatment till the time for spraying. Healthy growth above ground should be encouraged to the utmost. Should the growths be at all weak, a dressing of one of the special concentrated manures is of value if sown between the rows when rain is expected.

Spraying, now looked upon as an essential part of successful Potato culture, should be commenced before signs of disease appear, in dry weather, usually about the middle of June. One or two sprayings later on, at intervals of a foot, right, should also be given. A popular mixture for spraying consists of 2 lb. sulphate of copper, 2½ lb. washing soda, and 10 gallons of clean water. The sulphate of copper is powdered and dissolved, and also the washing soda; the solutions are then mixed with the proper amount of water, stirred continuously. The mixture is applied to the haulms in a fine spray by a machine. In dull, dry weather is the best for spraying, and should heavy rain fall before the spray has dried on the foliage it is advisable to give a further dressing. It is largely the grower's fault if his Potatoes rot in the field. Spraying is no longer an experiment, it is a necessity, and those who recognise this fact will reap their reward.

Finally, lift the Potatoes as soon as they are matured, as I am quite sure many are thus saved from disease. Some growers believe that unless the tubers are thoroughly ripe they do not keep so well, but in my opinion that is quite a mistake. I have, when fearing a spell of wet weather, had them all lifted by the second week of September, and the sprouts were of the size I prefer storing the crop in a cool shed. *James E. Pater, Aldenham.*

SULPHUR FOR DAMPING OFF OF SEEDLINGS.

When raising Cauliflower, Cabbage, and Brussels Sprouts under glass last spring, when I was forced to do owing to the heavy rains, I found that they were much affected by mildew and covered with the white mould. I sprinkled the boxes lightly with flowers of sulphur, with the best results. The fungus disappeared in a few hours, and these seedlings dressed with the sulphur grew much more sturdily and rapidly than the others.

POTATOS AND GREEN MANURING.

The finest crop of Potatoes here last year was obtained from a patch of "rogues," the tubers being large, handsome, and clear-skinned, averaging 5½ ozs. per root. The original crop (Up to Date) had been lifted the year before, and the ground subsequently used for burying all the green rubbish from the house, dead flowers, and green-stuff of no use to the farm, for which trenches were opened up as required, and it is curious that the small Potatoes left in the ground were not discovered. In the spring there was such a good show of young shoots covering the patch that they were left untouched, and, of course, could be neither hoed nor earthed up. In spite of which, this excellent crop was obtained and showed no sign of disease.

The cottagers in the New Forest often grow a crop of Trifolium and clover in preparatory to a Potato crop, and in these days of shortage of farmyard manure it may be well to practise green manuring for Potatoes more frequently.

Some small tests of sulphate of ammonia and superphosphate for Potatoes were made here last summer with the object of getting the small holder and cottager to use artificials. It was found that a sprinkling of the two manures after earthing up gave an increase of 5 lbs. of tubers to the square yard, at the cost of under 4d. The ground had been dressed with farmyard manure in the usual way for both samples.

Without artificials we got 14 lbs. to the square yard, and with them 19 lbs. *A. M. Martineau*

SELECT VEGETABLES.

It may interest *J.*, page 71, to know that Messrs. Sutton offer seeds of the Haricot Bean Green Gem, the original of which was, and probably is, still very popular in the French markets. The pods are beautiful in shape and colour, retaining the latter when cooked. The ripe seed is also pale green and retains this colour when cooked. In pre-war days they offered White Haricot as well. Any Dwarf Bean can be used as Haricots Verts, when gathered in the young state, but Green Gem and White Haricot are best in the dried state. Messrs. Barr and Sons offer Green Haricot, Messrs. Dobbie and Co. offer Dwarf Bean Golden Butter. Last year Messrs. H. Cannell and Sons offered Mont d'Or Dwarf and Mont d'Or Runner, both Wax Pod and Golden Butter Beans; probably they still offer them. I was interested in the statement that Asparagus Kale was more productive and lasting than either South or Cottagers' Kale. This is not quite my experience. Asparagus Kale is valued chiefly for the succulent young flower-stems that shoot up in the spring of the second year. Young sprouts of Cottagers' Kale are used much in the same way in spring. The thirty South housekeeper beans gathering the young leaves of Curled Kale as soon as they are large enough for use, and of times to do so all the summer, while the leaves remain tender. After the advent of frost every green leaf becomes tender and available. In spring the young flower-stems and leaves are very tender. An all round bed for complaint to me last November, that the leaves were tough. I advised him to wait until the frost was past, and he now agrees that it was all right. *J. E.*

BLACK ROT OF CABBAGES.

The bacterial disease of Cabbage and other Brassicas due to *Bacterium campestris* has recently made its appearance in South Africa, near Pretoria, where it has been investigated* by Dr. E. M. Dodge. This author has made the interesting discovery that the disease was introduced in seeds from England. It had previously been suggested that the disease is distributed in this manner, and the accuracy of the suggestion has now been verified. For disinfection of the seed a solution of formalin, 1 in 240 of water, or mercuric chloride, 1 in 1,000, for 15 minutes, is recommended.

TIPS ON THE SOWING OF SEEDS.

Having too much importance can be placed on the sowing of the various vegetable seeds which will require to be sown during the next six weeks, or two months in the open ground. More especially is care needed where the land is of a tenacious and unkindly nature.

A serious mistake many cultivators make is that of getting in the seed on a certain date, no matter whether the soil is in a proper condition or not, the result being imperfect germination and unsatisfactory results. It is better to wait for several days, or even weeks, than risk sowing when the land is unsuitable, but my advice is never miss an opportunity of fine weather to rake the soil to a fine tilth.

Another mistake often made is that of sowing too thickly, resulting in a waste of seed, and entailing much labour in thinning. If there is a doubt as to their germinating properties, seeds

should always be tested; a good rule is to sow just about as thick again as the plants are finally to grow, and thin to the proper distance apart. I have for many years practised the system of sowing the majority of vegetables in shallow boxes, raising the seedlings under glass, and planting them out later when the weather is genial. This system has many advantages over that of sowing in the open, as the seedlings can be cultivated in more favourable conditions, the plants consequently being much stronger, and benefiting rather than otherwise by being transplanted. I refer to Peas, Beans of all kinds, Onions, Leeks, Lettuces, Cauliflowers, Cabbage, Brussels Sprouts, Broccolis, Parsley, and others. But this plan is not suited to the majority of root crops.

The seeds should always be buried to about their own depth, whether sown in the open, in pots, or in boxes.

Wherever possible, sowing in drills, in the open, should be adopted in preference to the slovenly method of broadcasting. This remark applies more especially to permanent beds.

After sowing, shallow alleys should be thrown out between the beds, and the surface of the latter finally and properly raked level. All the rows should be neatly labelled and the date of sowing recorded. *Edwin Borkett.*

SPINACH BEET.

More attention has been directed to this exceedingly useful vegetable within the last few years than was formerly the case. Even now, however, its merits are often overlooked, yet there are few, if any, vegetables that possess the "cut and come again" quality in so marked a manner as this. In small gardens the Spinach Beet is particularly valuable, as it gives such liberal returns for the small amount of space occupied. In my suburban garden, which is in a hot and dry position, the common Spinach runs to seed quickly, while the Spinach Beet is very satisfactory. The first sowing is made at the end of March or early in April, and picking commences in about six weeks or a little more from that date. This crop will keep by a succession till autumn is well advanced, and, in fact, given mild weather, leaves may be gathered in the winter. The best yield at that season is, however, furnished by a second sowing, made towards the end of July, at which time if well watered when necessary the plant grows rapidly. Those from both sowings will, however, if allowed to stand over the winter yield frequent pickings again in the spring. At present they present a very unlovely appearance, owing to the severe weather, but are quite safe and ready to start into growth again. A good plan is before this takes place to cut off all the old and partially decayed leaves, then run a hose between the rows, and give a dressing with some stimulant, or a soaking with liquid manure. A good plan is to sow the seeds in drills 13 inches apart, though sometimes a less distance is recommended. The plants may be thinned out to 6 inches or thereabout from each other, the thinnings supplying the first cooking. Rich, well-drained soil is necessary for the best results. The New Zealand Spinach is also suitable for dry soils, but it is killed by the first frost. While I much prefer the flavour of the Spinach Beet, there are, of course, on this point differences of opinion. *W. T.*

THE BULB GARDEN.

LATE SNOWDROPS.

Snowdrops are very late everywhere, and here there are hardly any in bloom. In the higher parts of Dumfriesshire I saw a clump in the drooping stage in the garden of Mr. J. A. Mather, Hastings Hall, Moniaive, early in February. The garden is about 390 feet above sea level. The Snowdrops were in the grass and in a sheltered place. *S. Arnott.*

* *S. African Journal of Science*, Vol. XII, No. 10.

BRITISH WHOLESALE FLORISTS' FEDERATION.

The first general meeting of this society was held on Tuesday, the 13th inst., at Essex Hall, Strand, London, at 3 p.m. Nearly one hundred members of the wholesale trade attended, and Mr. George Monro, jun., was elected to the chair. It was decided that the title of the federation should be as given above, and the objects were stated to be to enrol as members all wholesale florists, whether growers or salesmen, in the British Isles; to protect and further the interests of members and of the wholesale florists' trade generally; to anticipate and promote legislation, and influence contemplated legislation affecting the trade; to disseminate information concerning improved methods of production and business organisation; to encourage a spirit of goodwill and mutual helpfulness between employers and employees; and to facilitate social intercourse and encourage the spirit of friendly regard among the members.

The chairman referred to the advantage it would be to the trade in general, especially in influencing the Government on the question of proposed restrictions, to be represented by an organisation which covered the whole, instead of a section only, of the wholesale florists of this country.

The provisional committee formed on January 15 had met on several occasions, and had co-opted other members for dealing with specific subjects. For instance, the Government had issued an order to commandeer all stocks of raffia amounting to over 2 cwt. each, and the committee had approached the Board of Trade, with the result that the order was made to apply only to raffia at the docks, the stock in the hands of dealers and the trade being untouched. The clerical work of the Federation had already assumed such large proportions that offices had been taken at 35, Wellington Street, and the services of Mr. C. H. Curtis engaged as secretary. The committee had considered the question of the importation of foreign cut flowers, and had approached the Board of Trade with a view to obtaining a promise that the prohibition of importation of cut flowers should be applied in the case of Dutch bulbous flowers. At that time, it was the opinion of the authorities that the trade was so small as not to be worth troubling about, but since the committee's visit the trade had been stopped. He then referred to the new railway regulations, to come into force on April 1, by which all freights by passenger train were payable in advance, and goods were sent at consignee's risk. This would be a serious hardship for growers, and would be certain to involve heavy losses. In regard to national service, it was a relief to find that it was not the intention of the Government immediately to close down all so-called non-essential trades, as these trades would be needed again immediately after the war, and complete cessation would involve disorganisation. Referring to the serious shortage of food, he urged the members of the Federation to do all they could to increase supplies, and expressed disagreement with the view that the lack of Potatoes was due to their being held up by owners of stocks. He stated that the committee had considered the future of the British bulb-growing industry. It was proposed by the committee from time to time to co-opt members, if necessary from outside the membership of the Federation, to deal with special subjects such as market credit, railways, rating, and land tenure, thus obtaining the best expert opinion on all matters in which the trade would be interested. The chairman concluded by an appeal for funds to carry on the immediately necessary work.

Arising out of the chairman's statement, Mr. Philip Ladds moved: "That the members of the British Wholesale Florists' Federation pledge themselves to devote at least 50 per cent. of their open ground to food production, and to grow only sufficient flowers and plants to keep the florists' trade alive and preserve the stocks which will be necessary for immediate development at the close of the war." This was seconded by Mr. Harry Mount, and carried unanimously.

The rules drawn up by the provisional committee were adopted, with one slight alteration. Mr. Geo. Monro, jun., was elected president of the Federation, and the members of the provisional committee, including those co-opted, were elected *en bloc*, together with nine others, to constitute the committee of the Federation.

PINES AND OAKS IN NEW ZEALAND.

Mr. T. W. Adams, the well-known arboriculturist, has lately published, in *Trans. N. Z. Zealand Institute*, 1916, pp. 216-228, lists of the Pines and Oaks that have been introduced into New Zealand. He enumerates 55 species of Pine. *Pinus insignis* makes astounding growth; trees planted in 1875 at Greendale, in the South Island, have now attained 128 feet in height, and are still growing vigorously. No other species yet planted in New Zealand can compare in rate of growth with this tree. The Corsican Pine is, perhaps, the best species for timber production. The Scots Pine, introduced by seed in quantity in 1864, was attacked by an aphid, and only a few specimens survive. The Maritime Pine is the best for seaside planting, while *Pinus muricata* makes a valuable shelter tree. *Pinus yunnanensis*, introduced in 1909, is a beautiful species, which is much admired for its rapid growth and fine form.

About 65 kinds of Oak are now growing in New Zealand, but most of them are represented only by young specimens. *Quercus pedunculata* grows well, a tree planted at Greendale in 1869 being 59 feet high and 6 feet 4 inches in girth. The American *Q. alba* does not seem to thrive much better in New Zealand than in England, where it is a complete failure. *Q. Mirbeckii*, the representative of our common Oak in Algeria, succeeds well. The red Oaks, *Q. coccinea*, *Q. rubra*, and *Q. palustris*, have done fairly well, and are of ornamental value on account of their beautiful autumn colouring. *Q. dentata* has the finest foliage. Although not so large as those of *Q. macrocarpa*, the leaves resist the wind much better, and are retained on the tree till spring. The Evergreen Oak (*Q. Ilex*) was early introduced, and grows well throughout New Zealand. *J. Henry*.

FRUIT REGISTER.

AMERICAN APPLES.

Knowing how difficult it is to obtain desirable English dessert Apples after Cox's Orange Pippin is over, I planted last autumn a few trees of American varieties obtained from an English nursery. One variety I am testing is Grimes' Golden Pippin, an Apple of high quality and of good appearance when grown in the States. American cultivators consider that the variety makes its best growth on well-drained, fertile, moist soil. Stayman Winesap is a standard variety of Virginia, where it does best on good loam, not too rich in organic material. Delicious is thought highly of by those who have grown it; it is said to be vigorous, free in bearing, and with fine-grained, juicy, melting flesh. *E. M.*

THE FLOWER GARDEN.

By W. J. GUISE, Gardener to Mrs. DEMPSTER, Keele Hall, Staffordshire.

TIGRIDIA (FERRARIA).—In cold, wet districts Tigridia are usually lifted, stored in sand, and placed in a frost-proof shed. Replanting may now commence, selecting a sunny position and light, sandy soil.

HERBACEOUS BORDERS.—As soon as the soil is in a workable condition planting should be concluded with all speed. Where the soil is light and warm autumn is much the best time to renovate the hardy flower border, but in heavy retentive soil, similar to what we have to deal with here, better results are obtained by spring planting. It may be necessary to divide and replant certain strong-growing plants that have outgrown their space, such as perennial Asters, Helianthus, Achillea, Astrantia, Campanula, Chrysanthemum, and Solidago. Surplus plants put in the reserve garden will provide blooms for cutting, or they may be utilised to fill spaces in shrubberies. When planting is finished fork the surface and apply a mulching of manure and decayed leaves in equal proportions. In planting new borders careful consideration must be given to provide a progression of colour rather than a contrast. For example light and dark blues grouped, with shades of yellow and white, followed by pink shades, then rose, crimson, scarlet, and orange, concluding with rich yellow, make a pleasing floral scene.

SPRING FLOWERS.—Failures in beds or borders caused by the severe weather should be made good forthwith. Stir the soil lightly between Wallflowers, Polyanthus and similar plants with the hoe or a small hand fork. Trim the grass verges and roll them; paths should be thoroughly scarified with an iron rake to dislodge moss, and the scarifying should be followed by rolling.

THE KITCHEN GARDEN.

By J. DENN, Foreman, Royal Gardens, Windsor.

GLOBE ARTICHOKE.—The protecting litter may be removed from Globe Artichokes and the ground between the rows forked. If new plantations are to be made, prepare the ground, but defer the planting for another month.

CELERY.—Sow Celery seed in gentle warmth, covering the seeds lightly with fine soil. Keep a watch for slugs when the seedlings are showing through the surface. Prick off the plants as soon as they are large enough and never allow them to suffer from want of moisture at the roots. Sow the seeds thinly, and always allow sufficient space between the plants to ensure a stocky growth.

RADISHES.—Frequent small sowings of Radishes should be made in a slightly heated pit. Water the crop liberally to promote a quick growth. When ventilation is necessary, before the plants are well through the soil, guard against birds destroying the crop.

FRENCH BEANS.—Sow seeds of French Beans in 8-inch pots, or boxes having a depth of 7 inches, to produce a supply of pods in May. The receptacles should be filled to within 2 inches of the top with rich soil, thus leaving sufficient space for top-dressings as growth proceeds. Plants from which pods are being gathered should receive frequent applications of liquid manure and the pods gathered as they become large enough, whether required for immediate use or not. A light position and plenty of atmospheric moisture are necessary, or the plants may soon become infested with red spider. Later batches of plants should be top-dressed as it becomes necessary, and a number of twigs placed in the pots to keep the plants upright.

TOMATOS.—The earliest plants of Tomatos are swelling their fruits, and will be benefited by a top-dressing of fine loam and concentrated

manure, which should be applied carefully and made firm on the surface, so that it may not be disturbed in watering. Remove all side-shoots as they appear and thin the foliage as it becomes necessary, with a view to increasing the size of the fruit. Plants raised early in the year will soon be ready for their final potting, and for this purpose a compost of two-thirds turfy loam and one-third decayed manure, with a good sprinkling of old lime rubble, should be prepared in advance. Crock the pots carefully and pot the plants moderately firm, taking care not to break the roots. If the plants are well watered a few hours before they are potted, so that the soil is in a moderately moist condition when they are shifted, watering will not be necessary for a few days. A strong stick should be placed by each plant after it is potted to keep the shoot upright. Grow the plants in a house with a temperature of 60°, and admit air on all favourable occasions. Make another sowing for succession, and pot all young Tomatoes as it becomes necessary.

FRUITS UNDER GLASS.

By JAS. HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton, W.

LATE VINES.—Earlier in the season I recommended that no great haste should be made in starting the vines in late houses, but the vineries must now be closed in order that there may be time to obtain perfect ripening of the berries by the autumn, and especially varieties of the Muscat of Alexandria type. Certain black Grapes, including Lady Downe's and Gros Colman, need a fairly long season to bring them to perfection. It will be well, therefore, to close the houses by the end of the present month at the latest. It is surprising how soon the vine responds to a little extra warmth at this season with regular syringings. There is no need to start the Black Hamburg house, even if it contains a few vines of Madresfield Court variety, but rather let the rods break naturally. There are no black Grapes that equal these whilst they are in season, and during September and October they are invaluable. In closing the houses containing the varieties mentioned earlier a slight turn of the hot water valves is recommended, seeing that there are almost continuous morning frosts. If the thermometers register 55° at the time the fires are banked it will suffice for the first few weeks. Young rods that have been allowed a considerable extension should be watched to see that they break regularly, and should a bud remain dormant just where a shoot is needed it will be well to bind a little Sphagnum moss around but not right over it.

VINES NOW IN ACTIVE GROWTH.—Vines that are now growing freely, and with bunches approaching the flowering stage, should receive every encouragement by closing the ventilators early on sunny days and damping freely. Give almost daily attention to stopping the young growths. My practice is to stop them at two joints beyond the bunch and the lateral shoots at the first leaf. Aim at a regular distribution of the shoots, and never allow sub-laterals to extend to the detriment of others and the crowding of the foliage. I never tie the shoots permanently until the bunches are thinned. Keep a watchful eye for insect pests; red spider soon spreads on shoots near the water-pipes. Thrips that may have been brought into the vinery on other plants must be guarded against, but mealy bug is the worst pest.

STRAWBERRIES.—The berries on plants that were started early in January are showing indications of colouring. At that stage watering must be done with extreme care, and plenty of light is necessary. At no time during the forcing of Strawberries should liquid manure from the farmyard be used. Soot-water is a good stimulant, and perhaps the best of all. When the berries become too heavy for the stem to support it is a common practice to place a forked stick under them, but I prefer wire supports, made by Messrs. Timby and Sandwith. Do not keep plants that have been forced early for planting out, as it does not pay, but some of

the later, or mid-season, batches may be used for the purpose.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcote, Eastwell Park, Kent.

MARGUERITES.—The white varieties of Marguerite are especially useful for church decoration at Easter. Plants potted last autumn and kept gently growing actively through the winter have filled their pots with roots, and care must be taken, as the sun gains power, to give ample supplies of water and stimulants such as soot or weak manure-water, varied with an occasional pinch of a safe fertiliser. Plants for later blooming should be pinched again, and potted into larger pots. Use a rich compost and leave plenty of space in the pot for watering. Cuttings inserted now will quickly make roots and develop into useful specimens. The double white variety Mrs. F. Sander is excellent for pot cultivation.

BULBS.—Spring-flowering bulbs will grow very fast now, and fresh batches should be removed to cool frames under a north wall, regulating the supply according to requirements. Most bulbs require plenty of water when in full growth, and they must be sheltered from cold draughts. If the flowers are required late in the season shade the house or pit heavily, and admit plenty of ventilation. As the early batches pass out of bloom remove them from the flowering house to a cold frame, and continue to water the roots until the foliage dies down.

COLEUS THYRSODEUS.—The house in which Coleus thyrsoides is grown should not be kept too cool when in bloom; the spikes last splendidly under the treatment usually given to winter-flowering Begonias. Well-rooted plants can be forced into bloom early in the year, and a later batch will carry the flowering period over three months. As the plants get shabby, cut off the flower spikes, but not too low down, and place them in a warm, light house. Keep the roots somewhat dry, but spray the plants lightly overhead. After they have rested they will freely produce shoots suitable for making cuttings. Take these off when sufficiently strong, and strike them in a warm propagating frame.

HUMEA ELEGANS.—The pleasantly scented Humea elegans winters best if the pots are stood on, or plunged in ashes in a cool frame. In these conditions the roots require very little water in winter. The plants should never be allowed to become pot-bound in their early stages, or they will receive a check, and the leaves will turn yellow. They should therefore be potted into their final pots in late autumn. An abundance of air should be given in genial weather, and the plants stand on a cool, damp bottom as long as possible, before removing them to the conservatory. Care in watering is necessary at all stages of growth; for Humea, if kept too damp, are apt to collapse suddenly, when an examination of the plant will reveal decay in the stem at a point just above the soil.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. F. DAVEY, Abbot's Wood, Godalming, Surrey.

PLANTING.—There is just time for further planting, provided the trees are at hand or can be secured locally, so that the roots will not be long enough out of the soil to get dry. Late planting is often worth the risk, as a season may be gained thereby. All newly-planted trees should be securely staked, and those in the open or on walls trained in position. The soil about the roots should be trodden firm.

EARLY PEARS.—When the blossom on early Pears in showing colour get ready some light protective material for use when the flowers expand, or before they show signs of opening. Spray the trees with a very weak, fine spray of soluble petroleum to check the Pear fly, which appears at this date. The female deposits her eggs in the ovary, and appears later in the fruit in the form of a maggot, causing the embryo to sicken and drop. The Pear midge is a dreadful scourge, and I do not hesitate, on a warm, fine

day, when the flowers are open, to give a soft, gentle spray that will not harm the pistil or ovary. The same spray may also be applied to Apricot trees, just before the flowers actually expand, and Peaches, to keep aphid in check.

AMERICAN BLIGHT.—This troublesome pest must be watched for, as any insects that have escaped destruction in the winter dressings of the trees will soon be on the move. At the first sign of the insect use strong measures to arrest its progress, such as Kerosene Emulsion applied with a hand-brush, by syringing, or, in the case of large trees, a strong sprayer. The pest spreads rapidly and soon infects clean trees; every means should be directed to check its progress and eradicate it.

BIG-BUD IN BLACK CURRANTS. The bushes of Black Currant should be examined for the big-bud mite, and, if any doubt exists, investigate with a powerful magnifying glass. If the mite appears to be present cut away the affected branches and burn them. Dress or spray the remaining branches with lime and sulphur, mixing the sulphur in milk. A good dressing of fine lime mixed with a little petroleum should be applied under the bushes. Ants are a great trouble to fruit trees in blossom, and especially those growing in light, dry soils.

THE PROPAGATION OF FRUIT BUSHES.—Cuttings of bush fruits inserted in the ground earlier in the season have probably been loosened by the action of frost, and should be made quite firm again in the soil. Bushes raised from cuttings inserted in 1915 that have not been transplanted should be given more room.

THE ORCHID HOUSE.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Godalming Park, Reigate.

CATTLEYA.—Plants which have been resting since passing out of flower are now developing new roots. Any necessary repotting may be attended to at this period. Vigorous plants which have outgrown their pots should be shifted into larger ones. Specimens in sour soil should be taken out of their pots, all the old compost shaken out, the dead roots cut off, and useless pseudo-bulbs removed. Where the rooting material is still in good condition and there is room in the pot for the plant to develop, some of the old soil may be picked from between the roots with a pointed stick, and replaced by new material. Vigorous plants should be afforded more root space than those of weaker habit.

MEXICAN HOUSE.—The numerous varieties of *Laelia auripus* will by now have passed out of bloom, and as soon as young roots are developed to be emerging from the base of the last developed pseudo-bulb, any necessary repotting or top-dressing should be done at once. Specimen plants growing in receptacles sufficiently large for the next season's growth should not be disturbed, unless the old compost has become loose and decayed. It should in such cases be carefully removed with a pointed stick, washing out all small particles from the drainage, and replacing it with new material. Plants that have outgrown their space and become open in the centre should be taken out of their receptacles, cutting away all decayed roots and useless pseudo-bulbs, and leaving three or four behind each leaf. If large specimens are desired, place several growths in the same receptacle, distributing the leads equally over the surface; or to increase the stock of any particular variety the portions may be potted up separately. Medium-depth pans with out-side holes are suitable to their requirements. Keep the rhizomes on a level with the rim of the pan, which should be about half filled with drainage. A suitable compost consists of equal parts of manure and F. Fibre cut up rather roughly, with the small particles removed, pressed rather firmly around the rhizomes, with some pieces of crocks inserted at intervals to ensure a free passage of water. After repotting, water should be applied with discretion, merely pouring it around the outside edges of the compost, to induce root action. If too much moisture is applied at this stage the old roots will decay. As the season advances, the amount of water should be increased, together with atmospheric moisture and frequent sprayings overhead.

EDITORIAL NOTICE.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHERS; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and such unnecessary delay and confusion arise when letters are misdirected.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years as Greenwich, 41.9°.

ACTUAL TEMPERATURE.—*Gardeners' Chronicle* Office, 41, Wellington Street, Covent Garden, London. Thursday, March 15 (10 a.m.) Bar. 30.2; temp. 44.5°. Weather—Sunshine.

SALES FOR THE ENSUING WEEK.

MONDAY.—Nursery Stock, Sheds, &c., at Russell's Nursery, Shaftesbury Lane, Harrow, at 2 p.m.; at Protheroe and Morris's Rooms.

WEDNESDAY.—Fruit Trees, Roses, Herbaceous Plants, &c., at 12 noon. Japanese Lilies at 3, at Protheroe and Morris's Rooms, 67, Cheapside, E.C.

THURSDAY.—Roses, at 67, Cheapside, at 1 p.m.; at Protheroe and Morris's Rooms.

FRIDAY.—Orchids, at Protheroe and Morris's Rooms, at 1 p.m.

The Restriction of Paper and the *Gardeners' Chronicle*.

It is a matter of common knowledge that imports of all objects other than those immediately essential to the prosecution of the war are being restricted. Among those objects is paper. It is, therefore, obligatory on every journal and newspaper to take its full share in reducing the amount of paper it has been accustomed to use. There are two methods by which this reduction can be effected. The indirect method consists of increasing the price, and so bringing about a reduction in circulation; the direct method is to decrease the size of the paper. The publishers and editors of the *Gardeners' Chronicle* have decided to adopt the latter method. A journal which is devoted to horticulture, and able to give assistance and advice with respect to food production, ought not to reduce its potentialities for usefulness, particularly at a time when so many are offering suggestions and urging measures which are remarkable rather as evidence of patriotism than of practical knowledge. It is the duty of horticultural journals to play the part of guide and helpful critic.

In accordance with this view, the *Gardeners' Chronicle* will devote an increasing amount of its space to the essential subject of food production. Those of our readers who have been accustomed week by week to find some moments of quiet distraction in reading of the manifold floral subjects with which for so many years we have been wont to deal in detail will, we feel sure, recognise with us that public need should come before private interest. Like the many cultivators who, for lack of labour and for other reasons, are compelled to reduce the stocks of their plants to the bare minimum, but who endeavour to preserve them from destruction, so we shall endeavour to keep alive the stores of horticultural knowledge already

gained in order that when the present crisis is over normal life and progress may be resumed. As heretofore, our columns will be open to all gardeners who can offer contributions towards the solution of the difficult problems in Food Production which beset alike the nation and (in a particular degree) horticulturists of all classes. We invite such contributions, and the only proviso we attach to them is that they be succinct as well as practical.

We would take this opportunity of asking our readers to inform us of any difficulty they may experience in obtaining copies of the *Gardeners' Chronicle*, and of urging them to make sure of securing their copies by placing their orders with newsgagents or railway book-stalls. The system of "returns" whereby unsold copies are sent back to the publishers entails a considerable amount of waste—waste of paper and of energy. It is likely that this system will be discontinued in the near future, and if so, only copies of journals and newspapers "ordered in advance" will be printed. We, therefore, strongly recommend such of our readers who have been in the habit of purchasing the *Gardeners' Chronicle* at any convenient book-stall to place their orders for regular delivery without delay.

Glass Houses and Food Production.

We have already pointed out on more than one occasion the help which owners of glasshouses can give to small gardeners and allotment holders, and we shall return to the subject again. But for the moment we wish to urge the extreme importance of utilising glass to prevent so far as may be the shortage of green vegetables which threatens during the coming summer. The severe weather has caused widespread damage to Cabbage plants which were set out in gardens in autumn. According to reports which we have received, injury and loss of this crop are widespread. Although this loss cannot be wholly compensated for, it may in part be mitigated. If early-maturing varieties of Cabbage are sown under glass even now, and the seedlings pricked out, grown on and hardened off, there is good prospect of the plants turning in and making good hearts before the autumn. The Royal Horticultural Society's trials at Wisley indicate that the following varieties are among the most suitable for this purpose:—Best of All (Barr), Barbinger (Nutting), Express (Nutting), Earliest (Sutton), First Crop (Johnson), First (Cooper, Taber). We hope that owners of gardens and gardeners in charge of glass will at once sow one or other of these varieties, and will let it be known in their several neighbourhoods that the plants will be at the disposal of holders of small gardens and allotments. We are well aware that the course which we recommend is bound to entail a certain measure of waste; for in the absence of any local organisation it will not be easy for gardeners to ascertain the extent of the demand which is likely

to be made upon them. We understand that steps are being taken to institute local organisations to ascertain and provide for the horticultural needs of each district. But any general organisation on these lines must take time. On the other hand, some districts are already well organised, and we hope that those who are willing to help in this direction will at once make sowings of the varieties of Cabbage mentioned above, and will then take steps to ascertain the requirements of their neighbours, in order to ensure that a sufficient number of seedlings may be pricked out to meet those demands so far as possible.

NEW SECRETARY TO THE BOARD OF AGRICULTURE.—SIR SYDNEY OLIVER will shortly vacate the office of Permanent Secretary of the Board of Agriculture and Fisheries, and will be succeeded by Mr. A. D. HALL, F.R.S., member of the Development Commission and technical and expert adviser to the Board. Mr. HALL was formerly Director of the Rothamsted Experimental Station, and first Principal of the South-Eastern Agricultural College, Wye. His appointment will give general satisfaction.

BRACKEN AS A VEGETABLE.—The well-known surgeon, SIR JAMES CRICHTON-BROWNE, in a communication to *The Observer*, states that the young shoots of Bracken are used as food in Japan, and considered to be a delicacy. The tender parts of the Bracken shoots are picked and carefully washed in fresh water. They are then plunged in boiling water, and remain there for two minutes, after which they are removed and placed in cold water, where they are left for two hours. After this preliminary preparation, they can be cooked in a variety of ways, notably as a *puree*, like Spinach, and with melted butter, like Asparagus heads.

THINNING OUT THE PHEASANTS.—The Destruction of Pheasants Order made by the Board of Agriculture and Fisheries extends to March 31 the season for killing pheasants, and authorises the War Agricultural Executive Committee of each county to take such action as is necessary to reduce the stock of pheasants on any land where there is a risk of substantial injury therefrom to crops. For this purpose the Committee may authorise the occupier to kill pheasants subject to certain limitations to be inserted in the authority, which will include those applicable to the killing of ground game under the Ground Game Act.

SCOTCH SEED POTATOS.—The Director General of Food Production has issued an appeal to Scottish farmers for the supply of Scottish-grown seed Potatos for use in England, and states that he is prepared to purchase the whole of the available stocks of the chief varieties of Potatos grown in the North. He has also appointed a representative committee of Scottish Potato merchants to act on his behalf, the chairman being Mr. ROBERT PATON.

ORCHID SALE AT WALTON GRANGE.—The catalogue of the collection of Orchids of the late Mr. WILLIAM THOMPSON, which will be sold by Messrs. PROTHEROE AND MORRIS on the premises at Walton Grange, Stone, Staffordshire, on Tuesday, April 24 and two following days, is a list of rare and beautiful Orchids, some of them being unique.

CROWN GALL.—Investigations carried out by Prof. CLAYTON SMITH show that certain species and varieties of Prunus possessed a considerable power of resistance to artificial inoculation with the bacterium responsible for the disease known as crown gall. A variety of *P. hortulanum*, Golden Beauty, is very resistant, and has, as well, other qualities which recom-

mend it for use as a stock; and *P. pumilus* is entirely resistant.

THE WARATAH (see fig. 41)—This rare Australian shrub, *Telopea speciosissima*, is flowering in the Cape House at Kew Gardens. The plant is sometimes called *Embotrium speciosissimum*, but is familiarly known in New South Wales, of which it is a native, as the Waratah, or Native Tulip. The shrub is an evergreen, from 6 to 8 feet high, with beautiful spikes of crimson blooms. It can be grown in a cool stove; it requires a good deal of water when making growth, but in winter it should be rested and kept very dry.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

GRASS ORCHARDS AND INSECTS.—*Southern Grower* on p. 106 asks if grass in orchards fosters injurious insects; my experience is quite contrary to that suggestion. One remarkable case occurred at Belvoir some five or six years ago. A double row of bush Apple trees in the kitchen garden suffered from a very bad attack of winter moth, which almost stripped them of leaves in the spring; in spite of repeated syringing, but trees close by in grass orchards escaped the attack, and the bush trees were cleared afterwards by gnaw landing in the autumn. Plums also, as standards on grass, escaped the aphid which sometimes attacked the trees on the walls. As a general rule, syringing with soft soap and carbolic acid just as the buds were bursting would prevent any trouble from aphid on Plums, but last year that did not prove effectual, possibly owing to lack of skill in application. Grass orchards are recommended for strong soils where the trees naturally grow vigorously, but not for poor, light or thin soils, where very little growth is made by the trees. Every effort should be made to encourage growth during the first ten years after planting, under all conditions of soil, as standard Apples take such a long time to produce a remunerative crop. There is not the least doubt about grass checking the growth of the trees, but if kept fed off by sheep or cattle it does not encourage insects. *W. H. Divers, "Wetdean," Hook, Sarbiton.*

THE HULL PUBLIC PARKS.—I had the pleasure of spending the greater part of Friday, the 2nd inst., in the company of Mr. Witty, the superintendent of the Hull Parks. In the afternoon we visited East Park, which is 76 acres in extent, and a most beautiful place. I was astonished on entering the large conservatory situated in the centre of the park to see a most lovely show of bloom, including well grown batches of *Cypripediums*, *Azaleas*, *Cyclamens*, *Cinerarias*, *Lilies*, *Begonias*, *Freesias*, *Carnations*, and *Lilacs*. Another park which must be a delightful place in the summer months is Pearson's Park. I am eagerly looking forward to being able, in the near future, to visit some of the other parks. One thing I would like to mention, namely, the fine avenues of street trees, with wide lawns running on either side of the roadway, each one being a mile in length. This idea might with advantage be carried out in other large towns, as the effect in summer must be delightful. At the present time Mr. Witty is busy with a food production scheme, and is preparing many acres of land with motor ploughs, etc. *Gunner Arthur James Ward.*

SUGAR BEET FOR PRESERVES.—My experience of boiling Sugar Beet is that, after seven hours, it shows no sign of pulping. By that time it becomes as soft as ordinary garden Beet after 1½ hour boiling. The Sugar Beet in this state has a distinct "mawkish" taste. I certainly should not like to spoil good fruit of any kind by adding Sugar Beet with the object of adding to the stocks of preserves. The water in which the Sugar Beet is boiled becomes quite sweet. Whether that would be of value in bottling fruit I cannot say. Some of the liquid is being tested in air-tight vessels to ascertain the length of time it can be preserved in its present condition. *E. Molgynce*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

FEBRUARY 27.—*Present:* Mr. E. A. Bowles (in the chair), Dr. A. B. Rendley, Messrs. W. Hales, E. J. Allard, W. G. Worsdell, Col. H. E. Rawson, J. Fraser, E. M. Holmes, Sir Everard in Thurn, and F. J. Chittenden (hon. sec.). *The late Mr. George Masson.*—The chairman referred to the great loss the committee had sus-

prised this is possible in every organ down to the finest filament, and in the case of even minutely serrated edges of leaves. In considering changes in the colour of light at different altitudes of the sun such modification should not be overlooked. The importance of this observation will be evident to those who believe that changes in the Tropæolum which Col. Rawson has exhibited from time to time are the result of a response to changes in light intensity. *Scale on Ixora coccinea.*—Mr. W. Hales exhibited scales of a curious filamentous shape occur-

FIG. 41. *TELOPEA SPECIOSISSIMA*. FLOWERS ORN. RED, BRACTS CRIMSON.

tained in the death of Mr. George Masson, F.M.H., who had for many years been a valued member of the Scientific Committee, and the committee unanimously desired that its expression of sympathy should be sent to his family.

The Action of Light in Inducing Variation.—Col. H. E. Rawson stated that by the method of selective screening which he adopts with plants the coloured diffraction bands due to interference at any opaque edge are entirely transformed or their saturation modified. With the aid of a

ring on the foliage of *Ixora coccinea* at the Chelsea Physic Garden, and remarked upon the difficulty of removing them by ordinary sponging. The scale appeared to be *Tachnaspis filiformis* (figured in the *Monograph Brit. Coccolp. I.*, p. 20, pl. xxxvii).

Anthoxanthum Puelii.—Mr. Fraser exhibited dried specimens of *Anthoxanthum Puelii* and of *A. odoratum*. The former he had found growing in the grounds at Holland House. It is an annual of tufted growth, and regarded as a pas-

turf or lawn grass quite useless—contrasting remarkably in its habit and growth with the more valuable *A. odoratum*.

MARCH 13.—The fortnightly meeting of the R.H.S. was held on Tuesday last in the Drill Hall, Buckingham Gate, Westminster. The exhibition was the largest since the New Year, and there were good exhibits in all sections.

The Floral Committee awarded ten Medals to groups.

The exhibits before the Narcissus Committee included one of the best groups in the hall; this was composed of Daffodils and Tulips in bowls of fibre.

The Orchid Committee awarded one First-class Certificate, one Award of Merit, one Preliminary Commendation to a novelty, and three Medals to groups.

The principal exhibit in the Fruit and Vegetable section was a collection of Apples from Messrs. SEABROOK AND SONS.

At the 3 o'clock meeting of the Fellows Mr. Edwin Bokett gave an address on "The Cultivation of Vegetables."

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), William Bolton, C. J. Lucas, R. Brooman-White, Walter Cobb, W. H. White, T. Armstrong, J. Charlesworth, Frederick J. Hanbury, H. G. Alexander, Stuart Low, and R. A. Rolfe.

FIRST-CLASS CERTIFICATE.

Laelio-Cattleya General Munde (*L. C. Rubens Lambanum* × *C. Hardyana*), from Messrs. CHARLESWORTH AND CO. A magnificent Laelio-Cattleya with extraordinarily large and finely coloured flowers, and of dwarf, compact growth. The flower, which is more than 7 inches across, has broadly ovate sepals and broader petals, both bright rosy-mauve colour, veined with a darker tint. The showy lip, with front lobe almost circular in outline, is deep ruby-purple. The tube is rose-colour with a yellow tinge, and the disc has yellow lines from the base to the centre.

AWARD OF MERIT.

Laelio-Cattleya Sirhan var. The President (*L. C. St. Gothard* × *C. Enid*), from Messrs. CHARLESWORTH AND CO. This is the finest hybrid of a very numerous batch raised by Messrs. Charlesworth and Co., and it gives an instance of the advantages to be obtained from good parents, no matter how remote. In the fine flower of the plant shown, C. Warner obtained through L. C. St. Gothard, was the prevailing feature both in size and colour. The broad sepals and petals are bright rose colour, the lips ruby-crimson with a bright yellow disc and yellow lines from the base.

PRELIMINARY COMMENDATION.

Odontoglossum cultans var. *Valcan* (*oreellens* × *Ossulstonii*), from Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells. A grand flower, and the second of the batch to receive the award accorded to noteworthy seedlings. The plant bore one large flower of fine substance and with very broad sepals and petals of a dark chocolate-red with pale yellow tips and margin. The lip is white, with red-brown blotches in front of the yellow crest.

(To be concluded.)

LECTURE ON VEGETABLES.

Before a crowded audience at the R.H.S. meeting on Tuesday last, Mr. BECKETT gave an address on "The Cultivation of Vegetables." The chair was taken by the Rev. Joseph Jacob. Mr. BECKETT stated that there were 17,000,000 acres of waste land in England which might be employed in producing food. He advocated thorough trenching of the soil, and gave the best methods of manuring, a system of rotating the crops, and other cultural details, including mulching. Early thinning of the crops was advised, and a selection of the most useful vegetables was enumerated, the lecturer drawing special attention to the great value of Potatoes. As a green winter vegetable the value of the Brussels Sprout was emphasised. At the close of his address Mr. BECKETT showed lantern pictures of vegetables growing at Aldenham, together with pictures of Leeks, Potatoes, Celery, Onions, and collections of vegetables.

CROPS AND STOCK ON THE HOME FARM.

CARROTS.

I do not know a root crop that will produce a greater yield per acre of food value than Carrots. Horses most appreciate the roots, which impart lustre to their coats. Pigs, too, relish them. Carrots can be lifted and stored in the autumn, and are thus always available, and unaffected by the weather. Carrots require special soil if they are to yield the fullest return for labour. From shallow, stony ground it is useless to expect a heavy crop. Deep, sandy soil, free from stones, is the most suitable, although good results may be obtained from soil of a heavy character, if well prepared in the autumn by deep ploughing and by thorough working in dry weather in February, to obtain a good tilth. Eight pounds of seed per acre should be drilled in March, in rows 14 inches apart, for the smaller growing red-skinned varieties. The Belgian White Carrot, which grows more vigorously, should have 18 inches of space between the rows. A fine surface tilth is an advantage, as the seed should not be drilled deeply. Belgian White is the best variety for cattle.

POTATOS ON GRASS.

Appropos of my remarks in this column, a correspondent from Halifax asks for advice on the ploughing of $\frac{1}{2}$ acre of pasture for Potatoes and other vegetables, how to till the soil afterwards by hand, and the quantity of "seed" tubers required for planting one acre.

I have already advised that Potatoes should not be grown on newly ploughed grass land, but as there appears to be a desire on the part of some to do so, and I will state the best manner of procedure. I may first state that my objections to growing Potatoes in this way are as follows:—(1) The risk of wireworm attacking the seed tubers; (2) the plough not burying the grass sufficiently deep, and the too-brief time for the grass to decay to be of manurial value to the crop; (3) the difficulty of earthing-up the plants owing to the scarcity of soil above the turf, except by hand; and (4) the still greater difficulty of digging the crop among the unrotted turf.

The most effective method of ploughing such land would be to adjust the skim coultter that it strips the turf line at least $\frac{1}{2}$ inch deep. This will enable the plough to turn the turf effectively into the furrows, especially if these are narrow. The ploughing should be at least 6 inches deep, and a greater depth would be an advantage. After the soil has settled down somewhat, make the drills with a hoe for the Potatoes in each third furrow at least 5 inches deep. Strew along the furrow superphosphate and sulphate of ammonia, 5 cwt. of the former to 1½ cwt. of the latter per acre. Cover the tubers by means of the hoe, and in due course level the soil from the furrows when hoeing the plot, for this will facilitate the work of earthing up the plants later by hand, as the unrotted turf would prevent the use of the plough. An alternative method of planting would be to dig over every third furrow, burying the turf deeper; this would entail much labour, but would be effective in better planting.

To plant one acre, 13 cwt. of tubers averaging 14 ounce, or 14 cwt. at 2 ounces, will suffice. My correspondent also asks as to basic slag as a manure for Potatoes. I do not think that this fertiliser will act quickly enough to benefit the Potatoes this season.

He also asks what other vegetables I would recommend. If the soil had been cultivated for some years I should advise Carrots and Parsnips to be grown freely, but in the present conditions I would advise various green crops, such as Brussels Sprouts, Cauld, Cottage's and Asparagus Kale, and varieties of Cabbage. I look upon Brussels Sprouts as the best of all green winter vegetables. They are ready for use in October and last continuously until April. Can this be said of any other green vegetable?

Onions and Turnips are useful. For late summer and autumn cropping, Scarlet Runner Beans will produce huge crops of food when highly cultivated, and of a superior, large-podded variety such as A1 or Emperor. The surplus pods can be preserved in salt for use in winter. *E. Molynax*

ACACIA DEALBATA: *Ignaramus*. *Acacia dealbata*, the Silver Wattle, is the most robust of all Acacias. It is therefore not adapted for growing as a pot plant, but when planted out in the border of a large greenhouse or conservatory it seldom fails to thrive and flower freely. The plant requires a light, rich compost, consisting of turfy loam and leaf-mould, freely intermixed with sand. During the spring and summer months Acacias need liberal supplies of water, both at the roots and overhead, to keep down attacks of red spider. Drought at the roots may have been the reason of your plant shedding its leaves. In the vicinity of large towns fog will often cause both leaves and flower-buds to drop. Acacias should be pruned immediately after flowering; the stronger growths should be cut hard back. A moist, close atmosphere is necessary to encourage the plants to break freely; afterwards a free admission of air, with full exposure to sunshine, is essential for the development of flowers. Plants growing in pots will be benefited greatly by plunging them out-of-doors from June to September. A temperature of 45° is suitable in winter.

MARKET WEIGHTS AND MEASURES: *G. B.* The following are the approximate weights of the various measures you mention: Broad Beans, pod, 14lbs.; Brussels Sprouts, bushel, 30lbs.; bag, 28lbs.; Cabbages and Cauliflowers, tally, five dozen; Parsnips, bushel, 1 cwt. The Leeks are quoted at per dozen bundles, not bunches.

NAMES OF FRUIT: *G. B. N.* 1, Newtown Pippin; 2, Gloseberry Pippin; 3, Tower of Glammis.

PEACH SHOOTS DISEASED: *A. L. Hooly*. The shoots sent are attacked by disease caused by the fungus Botrytis. Cut out the affected growth and spray the trees with permanganate of potash, using sufficient of the crystals to make a rose-colored solution. It is probable, as you suggest, that contact with the wire trellis during the severe frost may have contributed to the trouble.

POTTING PLANTS, &c.: *J. H. H., Siam*. Over potting is generally very harmful to plants, and it is not wise to shift them direct from very small pots into the largest-sized receptacles in which they are expected to flower. The root system is not at first able to make use of a large mass of soil, which becomes sour through being constantly saturated in watering the plants and is, in consequence, insufficiently aerated. Moreover, this dead, inert soil prevents the air from reaching the roots and thus predisposes them to decay. Manure rubbish is one of the best forms of lime to apply to garden soils, and you would be wise to use it freely on your clay land. You are not likely to cause harm to the plants by its freest use, but an excess might have the effect of liberating more plant food than the crops could assimilate, and this would result in a loss of fertility. Plants of the Ericaceae, including *Ericas* and *Rhododendrons*, are intolerant of lime in the soil, and it must not be used in their case. It is quite true that *Encharis grandiflora* flowers throughout the greater part of the year, but at indeterminate periods. You will find your plants give better results if they are partially rested for a period than if kept always in active growth. The seeds you mention are not to be found in the general nursery lists; you would doubtless be able to obtain them from a botanic garden.

MARKETS.

COVENT GARDEN, March 17.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that the quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—Eds.

REMARKS.—Home-grown Daffodils are more plentiful, and Pheasant Eye Narcissus, which advanced considerably in price last week, owing to the short supply, are now daily increasing in quantity and prices becoming lower. There is a good supply of Carnations, Snowdrops, Violets, Darwin Tulips and red Roses. Pink Roses are not arriving in any considerable quantity. Larger consignments of flowers are being sent from the Channel Islands, chiefly white Narcissus, Violets, Allium (Star of Bethlehem), and Anemone fulgens, and considerable quantities of yellow Narcissus and Daffodils are being received from the Scilly Islands. Small consignments continue to arrive from France, consisting of double and single Anemones, white Stocks, yellow Marguerites, Freesia, Acazia, and Parma Violets. The arrivals, however, are very irregular. Next Saturday, the 17th inst., is Shrove-tide Day, but there will not be the usual quantity of fruit from Ireland this year, on account of the difficulties of transit.

	— Tangerines, per box .. 20 0-26 0
	Walnuts, per per cwt. .. 56 0-85 0

REMARKS.—There is a fairly plentiful supply of Apples. Grapes are limited in quantity, but there are a good number of the Almeria kind. The first consignment of the new season's Brazil Nuts has reached Covent Garden. Forced Strawberries are commencing to arrive. Seakale, Cucumbers, Mushrooms, French Beans, New Potatoes, Asparagus and Salads are all available in fairly large quantities. The supplies of Mint are increasing. The only Bananas obtainable are the West Indian varieties. E. H. R., Covent Garden Market, March 17, 1917.

Potatoes.

REMARKS.—There is no fresh development in the Potato trade; supplies are still scarce and not sufficient to satisfy demands. Edward J. Newburn, Covent Garden and St. Pancras, March 17, 1917.

DEBATING SOCIETIES.

WARGRAVE AND DISTRICT GARDENERS'.—At the meeting of this Association, held on the 28th ult., Mr. J. F. Massord, Gardener to Mr. H. C. Bond, Wargrave Court, read a paper on "A Few Plants for Greenhouse and Conservatory Decoration." He described various bulbous flowering and foliage plants which succeeded one another from the commencement to the end of the year, giving short cultural directions. An exhibit of hardy flowering plants was staged by Messrs. Waterer, Sons, and Crisp, Ltd.

BATH GARDENERS'.—At the monthly meeting of the Bath Gardeners' Society, held on the 12th inst., Mr. F. Folwell, Gardener to Mr. C. Morley, of Stockerwick, read a paper on "The Vine."

GARDENING APPOINTMENT.

Mr. M. L. Sargeant, for nearly 8 years Gardener at Rockshaw, Merstham, as Gardener to D. STONER CROWTHER, Esq., Hay Green, Kingston Hill, Surrey.

SELECT VARIETIES OF ROSES.*

THE National Rose Society has recently issued to its members a small volume of 124 pp. which is in effect a combination in one volume of the Society's Official Catalogue of Roses and its Pruning Book, the latter perhaps the most popular of all the Society's publications. The new volume begins with selections of Roses for various purposes arranged in fifteen groups, of which we may hope to say something on another occasion. This is followed by the catalogue or descriptive list of Roses arranged first in alphabetical order and then in their several groups, while the last half of the volume is devoted to pruning instructions.

In the Descriptive List of Roses a somewhat drastic excision of the older varieties has been adopted, for, notwithstanding the introduction of eighty or ninety new names, the 623 Roses recommended in the 1914 edition of the Catalogue have been reduced to 453. This is no doubt an advantage in many ways and has on the whole been carefully done, but many will think that some older Roses of tried merit and good constitution have been taken out to make room for new varieties of poor constitution and doubtful longevity. For instance, Arish, with its fine growth and beautiful foliage, Lina, 'L'Ami-Michel, still the best pillar Rose we have, Andre Gimon, Clara Watson, Cramoisie Superieure, Mme. Bonnet-Duchier, Marquise Litta, L'Idéal and Paul Trauson no longer appear, though few who grow them are likely to be willing to discard them just yet, or to find more useful, or even equally good Roses among the new arrivals, while Killarney, Leuchtstern and Mrs. Edward

Mawley, though no doubt they have their defects, will not be banished from our gardens for many a year to come.

Speaking generally, the slaughter of the innocents has taken place on the lines that have become familiar of recent years. Thus we find the Bourbons have disappeared, and Zéphirene Prouhin is the only Hybrid Bourbon remaining. The Hybrid Perpetuals, notwithstanding two new-comers, are reduced to a very small body. A K. Williams is gone, its faultless shape has not saved it, nor has the fine growth of Charles-Lobvie, which Dean Hole thought, "when at its best, the best." Some may sigh over the loss of Gustave Piganeau and the fragrance of Sénateur Vaisse, hardly compensated for by the huge size of the new Candeur Lyonnaise, but the lack of continuity of flowering in the Hybrid Perpetual, the large proportion of inferior flowers it produces, together with the trouble and attention in the matter of feeding and disbudding required to obtain flowers of perfect character, make it certain that the reign of the H.P. is drawing to a close and its end only awaits some deepening in colour and fragrance and refinement of shape in the H.T. section.

The Tea Roses seem rather out of fashion just now, in spite of their great delicacy of tint and beauty of form and foliage, and only one Rose, Lady Plymouth, appears as a new-comer to this group, while there are many exclusions. Harry Kirk, with the doubtful exception of Killarney, the most be-mildewed Rose in the garden, has rightly gone (how can the R.H.S. have described this in their recent pamphlet as mildew-free?), but Little Dorrit and Mme. Henri Berger, which have also gone, ought to have been retained. The former, though not free from black spot, has great beauty as a decorative flower, and Mme. Henri Berger, though not large, is so uniformly good in form and its clear pink is so distinct in this group, that neither can be well replaced by any more modern Rose.

The arrangement of varieties under their different groups will doubtless be a subject of controversy, but it is a little difficult to understand why Pemberton's White Rambler should be placed by itself as a Hybrid Multiflora while Adrian Riverehon and Carmine Pillar, which are clearly also hybrids, should appear under the heading "Multiflora Rambler." Again, some Hybrid Teas, Mrs. F. W. Vander Velt and Mrs. C. E. Pearson, have been transferred from their true group to the unfortunate heading Pernetiana. The N.R.S. seems to have been peculiarly unhappy with regard to this name. Having made a mistake, as we think, in adopting it, they apparently try to justify the use of the term by describing it as R. lutea. There is no evidence of this. The Roses so described are not direct hybrids of R. lutea, but derived sometimes by a series of hybrids from Sabail d'Or, itself a descendant of Persian Yellow, the origin of which is unknown.

The last half of the volume is devoted to the pruning instructions, which follow very much the lines of the old Pruning Book, with a few simplifications and improvements. An alteration has, however, been made in the case of the illustrations. In the old book these consisted of line drawings showing how the pruning should be carried out, and they have now been replaced by photographs depicting the plants before and after the operation. These are doubtless more accurate than the old line drawings, but require rather more careful examination to find the position of the buds, to which regard must be had in carrying out the operation. It will be interesting to hear by which form of plate the novice finds it most easy to work. The book has no date, which is inconvenient.

In a year like the present, when the pruning of Rose bushes must in many, if not in most, cases, of necessity be trusted to inexperienced hands, the issue of this little volume should be very helpful.

ORCHID NOTES AND GLEANINGS.

DENDROCHILUM LATIFOLIUM LINDE.

AN inflorescence of this rare and elegant species taken from a plant collected in Borneo is sent by Mr. W. H. Bacon, gardener to Sir Marcus Samuel, Bart., The Mote, Maidstone. The slender, arching spike, 1 foot in length, bears thirty-five flowers, each about 1/2 inch across. The acuminate sepals are whitish, tinged with red, the narrower petals cream colour. The base of the lip is pale yellow, the narrow side lobes and blade of the front lobe, which is recurved at the apex, being coloured light chocolate. The pseudo-bulbs and broad dark green leaves resemble those of Coelogyne laevis, and the flowers are freely produced. The plant is also known as Platyclinis latifolia.

BRASSO-LAELIO CATTLEYA DIANA

A flower of this pretty new hybrid, between Brasso Cattleya Mrs. J. Leeman and Laelio Cattleya Dominicana, is sent by Messrs. Stuart Low and Co., Jarvisbrook, Sussex, with whom it has just flowered for the first time. The derivation gives Cattleya Dowiana aurea twice, and Laelia purpurata and Brassavola Digbyana once each. As might be expected, C. Dowiana shows more in this than in most other Brasso-Cattleyas, so far as the shape of the flower is concerned, but, on the contrary, its dark tints are eliminated, the colour of the hybrid reverting to a lighter tint than B. C. Mrs. J. Leeman. The sepals and petals are cream white, the lip pale lilac with greenish-sulphur disc and fringed margin. The sepals are spotted with purple on the reverse side and the flower is delicately fragrant.

NOTES FROM A GARDEN IN EAST HAMPSHIRE.

WE could see exactly how deep the frost—16°—went here under the grass, because we chanced to be trenching for a new Potato patch, and the men had to work with picks. Each day it had crept down and down until at last, at its deepest, it reached a depth of exactly 12 inches. That is bad for the roots of many plants; and let us trust we may not again in our time have such frost without the protection of snow.

As usual, there are contradictions. Adenocarpus anagyris has changed its brilliant ever-green dress for one of rusty red (it seems past recovery), while Euclyphia pinnatifolia, about equally soft, one would have supposed, is quite unaffected; and both are in the same situation. In climbers, too, Fortune's Yellow, a Rose generally reckoned about as delicate as, say, Maréchal Niel, beyond curling up a tip or two, has simply laughed at the frost; and the same is true of Jasminum primulinum on an east wall. Myrtus communis proved indifferent, M. Lina curled up its leaves (quite correctly), but now has uncurled them again. Not one of the above was protected except at the roots. Crinodendron Hookeri, which was unfortunately forgotten at matting-time, is apparently gone for good, and, though Grevillea sulphurea seems all right, G. rosmarinifolia looks ominously dark. Phylgelus capensis (an African plant?) only lost its extreme tips, while at its base it nursed a young shoot, which it started to lengthen at the first chance. A Silver Wattle Acacia dealbata 10 feet high, growing in the ground in a walled corner, shows so far no signs of failure. It is not actually matted up, but our matting is stretched straight across the angle to break the wind, and as both sides are wide open one can look in and see it in its cave. We shall not know about the matted-up things till later; and, of course, it is early to be sure of the others. They may go yet; one can but hope, and hope is the main-spring of gardening.

Speaking of our matting, I hope everybody knows of this excellent thing. It is so much better than Archangel mat, which, by the way,

* National Rose Society's Select List of Roses and Instructions for Pruning. Price 5s.

one cannot buy now. The old matting was all very well for hard, woolly things—an old Pomegranate, *Magnolia grandiflora*, or "Scented Verbena" but not really perfect for soft things, because it was too airless; it imprisoned the damp. (I am sure it killed my *Sollya* last year.) Coir matting is perfect, and lasts much longer.

Is it worth while growing those hardy plants? Some people say, "Grow what you know you can grow, and know you can keep; the rest is weariness." I am not certain; this may be true of, say, *Kalmia* in limestone or *Rhododendron* in chalk, but even if one has to replace one's treasures every few years, I am sure it is worth it, for the sake of the pleasure they give one in between.

Ten to twelve degrees of frost seems to be about

affected. Only where the waterfalls formed great masses of ice are the Hart's-tongues now all black.

Sir Herbert Maxwell referred (see *Gard. Chron.*, p. 105) to the evergreen *Berberis Knightii* as unaffected by frost. It is so here, and another *Berberis* that has been absolutely indifferent, though in a most exposed and wind-swept place, is *B. Gagnepainii* (see fig. 42). Another extraordinarily hard shrub is *Raphiolepis japonica*. It is here growing on an east wall, and seems to rejoice in a temperature which has considerably affected *Choisya ternata*, its next neighbour in the same position. Ours, it may be well to say, is by no means a "New Forest" climate. We are nearly 400 feet above sea-level, but the force of the wind is a good deal tempered by trees and buildings.

Of course, we might summer-fallow the ground, but to do that is to make a brand-new garden, which is exactly what one does not want.

In an ill moment we decided to leave out this winter (of all winters!) most of our Oleanders, as they were planted in a walled-in place that seemed quite sheltered from wind. To begin with, beyond heeling up the roots, we did nothing; but when the leaves began to curl we swathed the plants up in tiffany. It remains to be seen how they will pull through; at present they look like a lot of ghosts. The same thing was true of our beautiful *Crimums* of various sorts (like so many things in this garden, one of Mr. Elves' generous gifts). I planted them deep enough, as I thought, to be safe from frost, and protected them with litter, but have an uncomfortable feeling that the frost may possibly have caught the crown of the bulbs.

Sir Herbert Maxwell's remarks upon *Cyclamen* are interesting. Yet, which is "*Europaeum*"? If the leaves are already out when the flowers appear (they are out now), I call it *hederaefolium*, but when the flowers arrive on a bare plant, or flowers and leaves come up together, then, for me, it is *europaeum*. My *C. europaeum* (which I cannot even find at this moment) I obtained a good many years ago at Yzouvona (3,000 feet), in Corsica. While waiting for the train, I pulled the corms with my fingers out of the loose, gritty forest leaf-mould by the station entry. I suppose it is pretty generally known that *Cyclamen hederaefolium* possesses the power of killing, or, at any rate, of dominating, Ivy? Sir Herbert Maxwell's remark that he is planting it under a Pine tree reminds me that a few years ago in a Cornish garden I was shown some large patches of this plant under a Conifer, and that its owner, a very honest man, assured me that the whole thing had been a mass of Ivy, such as one so often sees under Conifers. He said that the Ivy had not been dug up but that the *Cyclamen* had been planted in the Ivy, with the result that it had entirely subdued or dominated it. In the garden here, where there are patches of *C. hederaefolium* which were planted some fifty or sixty years ago, you may see the same thing. They are growing in beds of Ivy; that is to say, there is Ivy all round them, while the *Cyclamen* patches remain clear. I have been examining this more carefully, and I find that occasionally long strands of Ivy do grow from one side to the other through the *Cyclamen* patch, but that, though there are leaves on either side, the growth where it runs through the *Cyclamen* is merely a bare stalk. It would be interesting to know wherein lies this property by which Ivy, so vigorous and masterful, can be checked. Even if *Cyclamen* were poisonous, this would not explain it, for poisonous plants, so far as I know, do not poison other plants. (We may except the case of certain trees, for here a different principle seems to be involved.) *Cyclamen* is certainly not poisonous to animals, for in some country—I think, perhaps, in Spain—I have seen pigs feeding on it. This reminds me that in the present difficulty, when people are so hard up for food for their pigs, they might do worse than raise *Asphodel* for this purpose. *Asphodelus ramosus* is easily raised, and its tuberous roots are a favourite food with wild swine. *Aubyn Trevor-Battye, Ashford Chase.*

FOREIGN CORRESPONDENCE.

A RARE POMOLOGICAL WORK.

I have read with much interest the note by Mr. E. A. Bunyard, in *Gardeners' Chronicle*, January 20, concerning the rare publication, *Pomologia Batava*, by Mathieu van Noort. It may be worthy of note that a copy of this work is in the library of the Massachusetts Horticultural Society, which agrees in all details with the description given by Mr. Bunyard. *William P. Rich, Secretary and Librarian, Massachusetts Horticultural Society.*

FIG. 42. BERBERIS GAGNEPAINII.

the limit which a good many things can stand without showing signs of failing. Certain of the Veronics, for instance, hold out quite well to about that point, and then collapse; *Hypericum Mosirianum* also, and Hedge-Fuchsia (*F. Coralina*). But this refers to simple frost; they will not stand so much as that where there is wind or things were wet. Wind will shrivel up even so strong a native plant as Hart's-tongue Fern. Along the stream that runs through this garden Hart's-tongue grows very luxuriantly; those plants which live on the top of the banks are all laid flat, their fronds look dried up and "chippy"; but the plants which grow low down under the protection of the bank are quite un-

About sixty years ago a "wild garden" was made here (they probably did not know it by that name, but that is what it was). In the neglect of many years it had practically reverted to woodland again, and we have lately been clearing it. The process has revealed various surviving remnants of plants, originally brought from abroad; now, after years of waiting, they again see the light. But they will hardly have time to flower before the evil fate will overtake them that now lies in wait. All over that ground are peeping out little pointed growths which visitors take to be Snowdrops; but I know better—they are the folded leaves of Garlic. This and Dog's Mercury are among our great enemies. What can we do?

VEGETABLES.

PLANTING FOR THE MAIN CROP OF POTATOS.

MR. PAICE gives sound advice on p. 114 in recommending the lifting of Potato tubers as soon as they are matured. It is too commonly considered that Potatos will not keep well unless they remain in the ground until their skins are perfectly set. We often raise our crop before it reaches that stage, and have, I consider, saved many from becoming diseased, without in the least impairing the quality or keeping powers. I commenced this practice in order to stop the "growing out" of the tubers, and, on finding its advantages, have continued to lift early. In giving a farmer friend, some years ago, advice relative to this subject, he was found to be sceptical, but after giving it a trial, he has since adopted it with success. This method is particularly beneficial where the land, as in our case, is heavy. It is advisable, however, not to store the unripe Potatos in large quantities at the time they are lifted. *Thos Coomber, The Hendon Gardens, Monmouth.*

FRUIT AND BRASSICAS

I FIRMLY believe in the under-cropping of fruit plantations, especially in private establishments, where the kitchen garden is none too large to meet the requirements of a large, well-staffed house.

Whilst working in a garden in Hertfordshire a few years ago, I was much impressed by the fine quality of the vegetables of the whole Brassica tribe, all being grown under mixed fruit trees, comprising standard Apples, Pears, Plums, and Damsons. I have rarely seen trees to heat them for cleanliness and healthiness. The trees were never sprayed, but every season washed with a mixture of lime and flowers of sulphur, half a pint of paraffin being added to every 3 gallons of the wash. The trunks and larger branches were treated thoroughly by means of a stiff brush.

Groove bands were applied to the Apple and Pear trees, and these were regreased occasionally. The soil consisted of a very heavy lay, and the digging and manuring of the ground kept the soil in a sound state of fertility, which, had it been laid down to grass, would most likely have been too heavy and waterlogged.

Organic manures were used in large quantities, and these too helped to improve the soil.

French Beans are a profitable crop to grow between the trees of a young fruit plantation.

During these times of food production and the ploughing of all available ground for Potatos, would it not be advisable to turn over the orchard land and plant it with winter greens, which might be expected to give a fair return, whilst Potatos on such land would be a very uncertain crop? *M. S. Ashford B.E.P.*

RIDGE CUCUMBER

In small gardens, where there is little or no glass, Ridge Cucumbers are very acceptable. Raise the plants singly in 3 inch pots in heat and harden them gradually. The position chosen for planting out of Jocos should be fully exposed to sunshine. Prepare a bed of leaves and litter, and on this place a layer one foot deep of rich soil in the form of a ridge, but with a flat top. The end of May is early enough to put the plants out. Cucumbers in the open are often a failure through lack of moisture at the roots. Spraying the plants morning and night is beneficial to hasten their development. Remove the points of the leading growths when the latter have attained a reasonable length, and peg the shoots to the soil to hold them in position against high winds. When the fruits have set, feed the roots with liquid manure at every fourth watering. In wet, sunless weather shield the plants from rain as much as possible, and if pro-

tected with something that is not transparent, remove it as soon as the rain ceases. *C. Davis, Holy Wells Park gardens, Ipswich.*

THE RELATIVE FOOD VALUES OF DIFFERENT VEGETABLE CROPS

At a time like the present, when due recognition of the food value of the various vegetable crops is of vital importance, more could be done to increase the food supply in "food units," or calories, if the information now being disseminated so freely were the product of careful thought. Much is being written that is true only so far as it goes, but is not calculated on a "stable basis."

For instance, as to the relative value of "food units" contained in 1 lb. Parsnips as against 1 lb. Potatos, the fallacy of which you so clearly point out on p. 86., the value of food units per lb. must be taken in conjunction with the number of lbs. of crop produced per unit of area. To this I should add the unit of time, or period required to mature the crop.

On this basis the Parsnip compares even more unfavourably with the Potato (than $\frac{1}{3}$ to 1).

Taking the time period of the Parsnip as 100, March to November, the period from date of sowing to the harvesting of the matured crop—against the time period of the Potato first or second earlies, i.e., April to August, it can be calculated thus, taking Parsnip as $\frac{1}{3}$, Potato as 1, and on the basis of 8 and 12 tons per acre respectively:

Parsnip,	Units Period, 100 months	Units Area, 1 Acre	Units Crop, 12 Tons	Units Food, 16
Potato	3	1	8	14

It will thus be seen that 1 unit of Potatos has double the food value of 1 rod of Parsnips, and that to this must be added the important fact that, whilst the Parsnip crop occupies the land for the whole growing season, the Potato crop can be lifted, and the land sown or planted with other Beans or Carrot, Turnip, Kohl Rabi, Sutton's Earliest, or Christmas Drumhead Cabbage, early in August, and again produce a crop of economic value. *D. W. Siggins*

EARLY VEGETABLES INDOORS

When glass is available, much can be done to obtain early crops of vegetables. Where portable frames can be spared, a sowing of Spinach should be made at once in rows drawn one foot apart in rich soil. The plants will supply an abundance of fibrous, fleshy leaves, far in advance of the outside crop, especially if the frames be placed on a good bed of leaves. Keep the lights closed until the seeds germinate; after, admit air on all favourable occasions. Dump the crop overhead, and close the frame fairly early in the afternoon of bright days, to husband the warmth. When the plants are well advanced, more air may be given, and the plants must not be allowed to suffer from want of moisture. An occasional sprinkling with sea water is beneficial, and stirring between the rows with the hoe. Thin the plants to about 8 inches apart in the rows. The Carter is a reliable variety.

French Climbing Beans are more remunerative than the Dwarf sorts after this date, and where a house with very slight heat is available, I would advise that they should be grown trained on the back wall of vineries, or on any available space, up strings or wires. I know of few things that give such a good return, and for such a length of time as these Climbing Beans. Sow the seeds in small pots in a temperature of 60°, and grow them as near the glass as possible until well established when they may be planted at 9 in. in the ground, kept watered and syringed. After the first flowers have set, give occasional waterings with liquid manure, and the plants will continue to crop until well into the summer. I find Princess of Wales an excellent variety.

Vegetable Marrows, if sown in heat, grown on in pots, and planted out in frames over a hot-bed at the beginning of April, will give valuable

early crops. Pollinate the flowers as they develop, and keep the growths well thinned. After a few fruits have set, water the roots liberally with liquid manure water. The lights may be left off entirely as the weather gets warmer and danger from frost is over. Moore's Cream, Table Dainty, and Improved Custard are all good varieties.

The more forward plants of the autumn sown Cauliflowers should be picked out, planted in houses, on borders, or in frames, kept well watered, syringed in bright weather, and fed liberally after they are well established. The heads will be ready by about the middle of May. First Crop and Mignon Bonum are suitable varieties for a succession. *H. E. Kemp, Priory Gardens, Blythe.*

GROW GARDEN BEET.

THE scarcity of Potatos has so impressed itself on the people's minds that everyone is insisting on growing Potatos. Nor would we for our part say a word to discourage them. But many who have come late into the market are finding a difficulty in obtaining "seed." To them particularly, and to all gardeners, we would point out the virtues of the Garden Beet. It yields well, and, as is well known, contains a high percentage of sugar. It is specially useful for late summer sowing. Sown in the South of England in the end of July, it stands even such severe frosts as those we have experienced during the past winter, and may be left in the ground and pulled when required. Furthermore, the seedlings transplant easily, and the thinnings may be planted in any piece of vacant ground and will produce fair roots.

Whether any simple means can be made use of to extract the sugar is extremely doubtful, but it is probable that it would be more economical to let one's own digestive organs do the extraction. Not the least that can be said in favour of the Beet is that as an article of diet it improves upon acquaintance. Not so long ago, the present writer turned up his nose at it except as an occasional ingredient in salads; but during the present winter he has made continuous use of it, now cooked, now raw, and by its aid he has been able to keep well within the sugar limits imposed by the Food Controller. Furthermore, it is well to remember that, although starch, so wide-spread in vegetables, gets itself changed into sugar by the digestion it undergoes when taken as food, sugar is, as it were, a ready-made (or almost ready-made) food, and is therefore among the best of energy-producing foods.

THE CULTIVATION OF KITCHEN GARDEN SOIL.

AMONGST the many pamphlets issued recently for the guidance of inexperienced cultivators this one will specially appeal to those who do not understand the many points that make soils suitable or unsuitable media for the roots of plants. It does not concern itself with particular crops, but it explains what the plants look for in the soil, how soil is improved by digging, trenching and hoeing. Next is explained the objects of manuring, how sour soils may be sweetened by slaked lime or chalk, and cases where one or other is the more appropriate for use. These things lead up to the consideration of special manures, organic and inorganic, and the particular uses of each are described in language which will be understood even by those "piano-funers" who are supposed to have turned their thoughts to agricultural work.

SUGAR BEET

MESSES BAKER AND SON, LTD., send us seeds of a variety of Sugar Beet known as Saccharina. They advise sowing in April or May in drills 18 inches apart and 1 1/2 inch deep. The seedlings must be thinned. The roots should be ready to lift at about the end of August.

* The Cultivation and Manuring of the Kitchen Garden, by E. Kothe, F.R.S., and F. J. Chittenden, (Royal Horticultural Society, Price 3d.)

CONFESSIONS OF A NOVICE.—XIV.

ADVICE TO ADVISORS

So many gardeners are now being called on to help inexperienced cultivators that a few hints on the art of advising may, perhaps, be of use. Inasmuch as "we are more of us infallible, not even the youngest," men more experienced than this present novice will forgive the presumption of one who, knowing so little, makes suggestions to those who know so much. But the times are urgent, and in the difficult condition in which the farmers—the wholesale suppliers of food—find themselves, a heavy duty is imposed on the small cultivators, the retailers, as it were—to supplement supplies from gardens and allotments.

Fortunately, the gardeners whose advice is sought have the first essential for advisors—knowledge—and therefore they will not make the fatal mistake of only talking about things; they will show them. Patient they are also, and hence they will not expect that once showing is enough. Reiteration, the recently discovered secret of advertisement, is the secret of teaching, and the great teacher is he who reiterates without tediousness.

Next to knowledge, good humour, a virtue not prized nearly so highly as it should be, is the quality of greatest worth to a teacher. It is the bouquet of the wine of character, just as knowledge is its body. It is because of their lack of good-nature that so many clever people fail to be good teachers, and remain only superior persons.

Descending from these remote heights of generalities to the lower level of actual pressing things, the advisor who can get his pupils on the ground actually to be cultivated can do more in half an hour than in twice that time spent in merely talking about cultivation. A handful of soil squeezed in the fist of each pupil may be made the basis of a whole story of garden lore: why clays must not be worked in wet weather, and why trampling over ground is bad. A hole dug in the ground reveals "form at a glance"—whether the sub-soil is near the surface, and whether it should be broken or left alone, and whether it will hold water like a pond or lose it like a sieve. I suppose it may be taken as a maxim of universal truth that, whilst the unskilled gardener has a passion for the watering-can, the skilled gardener loves the hoe, and therefore, although love is not always easy to explain, the advisor will do well to explain why he holds the hoe in such regard. But the good teacher does not explain over-much, for that is going out to meet trouble.

I like to think that in this new time the older gardeners are becoming the missionaries of the countryside, giving their knowledge in a great national war loan raised for the purpose of freeing the land from the heavy mortgage of indifference which town-bird men have laid upon it.

If to the qualities I have enumerated the body of knowledge and the bouquet of good humour, the advisor brings the spirit of enthusiasm, the wine of his advice will prove of such fine vintage as surely to rejoice the hearts of those who receive it.

I know, alas! that in many cases, though men of garden experience are willing enough to assist others, they lack the labour in their own gardens to give them much liberty to help others; but I also know that since the war gardeners have, if they ever pursued it—and I have heard it whispered that they did—lost the art of grumbling; and so, in spite of the difficulties which surround and confront them, this sincere friend of theirs, who is and will always be a novice, wishing to do the one little thing which he is able to do, ventures, admonitory proceeds notwithstanding, to offer advice to advisors. A. N.

TREES AND SHRUBS.

EFFECTS OF FROST ON SHRUBS AT ALDENHAM

Not since the year 1895 have we experienced anything like such severe weather as we have just gone through, and its effect on many of the shrubs is most marked.

Although the thermometer here registered a degree and a half below zero in '95, the most frost we have experienced this year is 29°, and yet in many cases things have suffered more severely. It is interesting to note how the many hundreds of new plants recently introduced from China have come through this ordeal of frost; and it is gratifying to be able to state that, so far as we are able to tell at the present moment, they have vindicated their reputation for hardiness.

Among the many beautiful Berberis introduced by Mr. Wilson nearly all have proved to be hardy. There are one or two exceptions, *Berberis lavis*, for instance, has suffered very badly indeed, and *B. subauliflata* is cut. Some few others have been "browned," but not, so far as we can tell, severely injured. Such species as *B. Sargentii* and *B. Julianeae* appear to be more hardy here than *B. Wallichiana* or *B. Knightii*.

The degree to which many plants have suffered appears to some extent to be due to the positions in which they are placed. Where one plant has been exposed to the cutting wind it has often been damaged, whereas another specimen of exactly the same species or variety has been untouched in a more sheltered position, only, perhaps, a few yards away. For instance, *Rhamnus Alaternus variegatus* in a sheltered position is quite sound, while other specimens more exposed are badly damaged.

Pyracantha Gibbii bears no severe marks of the frost, but the numbered *Pyracantha* collected by Forrest have appreciably suffered. Many *Veronias* which have been standing for some years have been injured, but many of the *V. Traversii* type, *V. Darwini*, and *V. decumbens*, have come through very well. The following species and varieties have suffered most.

E. Beckettii, Aldenham House, Gardens, Elstree, H. H. Woodhatch

Aristida Macqui and *A. M. variegata*
Azara integrifolia—very badly cut
Azara microphylla
Berberis lavis—almost killed
Berberis subauliflata
Berberis medeolensis
Ceanothus azureus and *varieties*—slightly cut
Ceanothus luteus
Colletia erucifolia—slightly cut
Cornus pumila—badly cut
Cotoneaster angustifolia } both practically killed
Cotoneaster panicosa }
Crocodendron Hookeri
Drumys Winteri
Escallonia floribunda—very badly cut
Escallonia longylevis }
Escallonia macrantha } cut according to position
Escallonia argentea }
Escallonia perfoliata
Leucantheum Bonsteanum
Leucantheum officinale
Laportea heterophylla
Langens sigillata
Ligustrum Henryi—apparently the only Chinese variety which has suffered severely. *L. Quilom*, only very slightly injured.
Mexica californica
Nesaea subfolia
Olonia Gummii
Osagei Traversii—very badly cut
Paeonia gracilis
Philomus cashmerianus
Philomus Davidsonii
Platanus palmifolia
Pectaneta attenuata—killed
Pyrus bursifolia
Pyrus betulaefolia
Quercus longifolia bambusaefolia
Rhamnus alaternus
Spiraea glauca
Veronica glauca obovata—badly cut
Veronica Li Solisiana (type)
Yonquera ternstroemii
Yucca Awabaki (var. *obovatisissima*)—killed.
Yucca cylindrica
Viburnum betulina (this species is of little value)
 Very badly cut in many cases.
Viburnum betulina reticulatum—not badly cut.
Viburnum lobophyllum
Viburnum Henryi
Viburnum propinquum.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcott, Eastwell Park, Kent.

FREESIA.—The flowers of late batches of *Freesia* should be neatly staked and tied whilst they are still upright. Increase the supply of water, and let healthy plants have a little stimulant to assist them to develop their flower spikes. Plants of the earlier batches that have bloomed should be returned to a frame, and watered until the growths show signs of ripening off, when the amount of water should be reduced gradually. When the foliage is quite dead, no more water should be given, and the bulbs should be exposed to full sunshine to ripen.

BOUVARDIA.—Plants of *Bouvardia* that were cut down after blooming are breaking into growth. Turn them out of the pots, shake most of the old soil from the roots, and repot them in much smaller pots, using a light compost. Grow the plants in a warm house, and as the shoots develop pinch out the points of the stouter ones, to ensure a bushy habit.

MAY-FLOWERING TULIPS.—May-flowering and Darwin Tulips are easy to cultivate and quick in flowering, being suitable for growing in pots or ornamental bowls. If the blooms are cut when fully grown, but before they have expanded, they will last fresh a long time in water. These late Tulips are not good subjects for hard forcing, and are much more satisfactory if allowed to flower without the use of fire-heat. Forcing results in inferior blooms that soon fade. For stakes use thin, neat Bamboo "points" or Hazel shoots.

PERPETUAL-FLOWERING CARNATIONS.—Even from plants that have been kept quite cool during the winter plenty of good cuttings are now available. Insert the shoots in shallow boxes filled with sand, and root them in a moderately warm house, shading the cuttings from strong sunshine. Keep them uniformly moist, and let the temperature range from 55° to 60°.

NERINE.—Plants of *Nerine* should be well supplied with water, whilst the foliage remains green. Grow the plants in a position exposed to full sunshine. When the leaves show signs of ripening, gradually decrease the amount of water, and when they have passed, withhold water entirely. The bulbs should be placed on a shelf for the summer and exposed to full sunshine and fresh air to ensure thorough ripening.

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor.

CUCUMBERS IN BOX FRAMES.—The present is a suitable time to make preparation for growing Cucumbers in frames. If horse-droppings and leaves are available they should be collected and placed together in equal parts to ferment. After the material has been thoroughly mixed and turned several times the bed should be made 18 inches wider than the frame all round to permit of fresh hot-bed material being placed around the frame when, later, the heat begins to decline. The soil should consist of turfy loam and leaf-mould in equal parts, and it should be placed in the frame several days before the plants are put out. When the plants have made two rough leaves the points of the shoots should be removed, and the plants stopped again at the second or third joint. Syringe the plants lightly in the early part of the day in fine weather, but see that the foliage becomes dry again before night.

CAULIFLOWER.—Plants in cold pits should be hardened gradually by removing the lights on mild, sunny days. If suitably hardened they should be ready for planting out-of-doors about April 10. Seeding Cauliflowers raised this spring should be pricked into a cold frame before they become drawn. They should be ready to plant out by the end of April.

LETTUCE.—A sowing of Lettuce seed may be made on a warm, south border in order to pro-

duce supplies in June. Seedlings raised from sowings made in October and wintered in cold pits should be planted at the earliest opportunity. A warm border should be selected for the purpose, and a space of 1 foot allowed between the plants each way. Keep a sharp look out for slugs, and protect the crop from birds if this is necessary.

ONIONS.—Young Onion plants should be pricked off before they become drawn. Grow them in a cool, light frame and ventilate carefully until the plants become established, after which they should be hardened gradually so that they will be ready for planting out about the end of April.

POTATOES.—Early and second early Potatoes should be planted in quantity as soon as the state of the soil permits. Potatoes are a most important crop, and special efforts should be made to have the soil thoroughly prepared, digging it deeply, and breaking the surface fine as the work proceeds. Allow a space of at least 30 inches between the rows and 15 inches from plant to plant in the row. A sprinkling of decayed leaves or spent manure from a Mushroom or Cucumber bed placed in the trenches before planting will do much to promote quick, healthy growth. The soil rulers of main crop and late varieties should receive attention at once.

MUSHROOMS. Mushroom beds sown in January are developing quantities of small button kinds. Mushrooms, which require very careful treatment. Do not use fresh-laid but endeavour to keep the temperature of the house as near 55° as possible by closing the ventilators and matting up the door so that cold draughts are excluded. When water is necessary, use rain-water very sparingly applying it through a fine rose. A covering of clean straw placed lightly over the surface will serve to keep the bed damp. Damp the walls and floor of the house as it becomes necessary to keep a moist atmosphere. Continue to collect and preserve material for successional beds, which should afford a supply in six weeks from the date of spawning.

VEGETABLE MARROW.—To obtain early Marrows sow the seeds singly in 4 inch pots and germinate them in gentle warmth. As soon as the plants have made two rough leaves they may be planted in a slightly heated pit, where plenty of ventilation can be applied in favourable weather.

CARROTS IN PITS. Carrots in pits should be ventilated freely and thinned as soon as they become large enough. Water the bed freely through a fine rose, and if necessary, cover the rows of Carrots with fine soil to keep them from turning green. A large sowing of Carrots may be made in the open as soon as the soil is in a suitable condition.

LETTUCE. Frames in which Lettices are growing should be ventilated freely in favourable weather and the soil between the plants stirred lightly with a small hoe. Dust the plants frequently with soot as a deterrent to slugs. Plants raised under glass should be hardened gradually and planted on a warm border as soon as they are large enough for shifting.

LEeks. The principal sowing of Leeks should be made with as little delay as possible. Young plants raised from early sowings should be carefully pricked into boxes of rich soil and grown in a cool pit until the time for planting.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

COELOGYNE. Plants of *CoeLOGYNE pandurata* are commencing to make new growths and will soon be developing roots. Any plants that have overgrown their receptacles may be repotted at this stage. The plants are best grown in shallow pans or teak wood baskets, and suspended from the rafters in the warmest house. In the process of repotting remove some of the old pseudo-bulbs, leaving only two behind the leading shoots. Plenty of room is necessary in the receptacle, as the rhizomes extend some inches each year after being potted. Plants that have sufficient room for the development of

their present season's growth, but with sour soil, should have as much as possible of the old rooting material picked from between the roots by means of a pointed stick. The drainage should be examined and fresh compost applied. This should consist of three parts Osmunda or Al fibre and one part fibrous loam from which all the small particles have been removed, and sphagnum moss, the whole chopped small and mixed together, adding sufficient crushed crocks to keep the soil porous. *CoeLOGYNE Massingiana*, *C. Dayana*, *C. Lowii*, *C. Mooreana* and *C. bipitata* are also becoming active at the roots, and any repotting necessary may be attended to. A suitable compost is formed of equal parts Osmunda fibre and Al fibre, with a small quantity of chopped sphagnum moss. The plants are best grown in shallow pans and suspended in the warmer end of the Cattleya house. After repotting, water should be applied very sparingly until the plants have rooted freely in the new compost, when they should receive liberal supplies of moisture until growth is completed.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. F. DAVY, Ashurst Wood, Guildford, Surrey.

PLANTING STRAWBERRIES.—The present is a good and opportune time for making an extra Strawberry bed. The plants will become established this year and make a good bed for 1918. It sometimes happens that spring planting is necessary because ground could not be spared in the autumn, or could not be got in a suitable condition. It is not to be expected that the crop this season will be large, but there will be sufficient for dessert purposes, especially if the variety Royal Sovereign is chosen, thinning the flowers, as they open, and assisting the development of the berries by dipping with liquid manure. Such plants could serve in their usual position, for if the flowers were removed they would produce early runners and stock plants. The ground should have been well prepared by double digging or trenching. In planting, tread the ground, make the surface firm, and afterwards rake the surface even. Turn the plants out of their pots carefully, preserving the roots and crown from injury, and set them at 12 inches apart in rows 2 feet asunder. I invariably secure my earliest fruits from these late plantings.

LABELLING FRUIT TREES. Examine the plants on fruit trees and remove any that have become undesirable. The Aime and the Ideal are two good labels, when dirty or disfigured they may be cleaned easily by washing with paraffin.

PREPARATIONS FOR GRAFTING. Suitable shoots for a vine, having been inserted in the soil under a north wall to have them a fortnight later in development than the stock, it is time to prepare the grafting mixture. Clay, free from stones or other rough material, should be mixed with cow manure in the form of a stiff paste. If preferred, soft泥 may be purchased from the horticultural supplier. Success in grafting depends chiefly on getting a joint union between stock and scion, which needs much practice.

FRUITS UNDER GLASS.

By JAS. HENSON, Gardener to Lordship House, Richmond, Esq., C.V.D. Gomersbury House, Ascot, W.

PEACHES AND NECTARINES. The earlier Peach and Nectarine trees are passing out of flower and will soon be making young growth; those in favour of local trees are probably more forward. Disbudding should be done gradually, removing a few shoots here and a few there, but I have seen crops spoiled by the sudden removal of the surplus growth. Disbudding gradually encourages the formation of small fruiting spurs, and I have a method that these short shoots frequently have many fruit buds forming on them, whilst long, elongated shoots have but few. We have at Gomersbury a trained tree of Royal George Peach in full flower with numbers of these short fruiting spurs. The same remark applies also to pit trees, which

frequently give a full crop on spur growths. Again, in dealing with a trained tree that is over- vigorous in growth, its goodness may be checked at the start if it is not disbudded too early. Trees that were lifted in the autumn to check exuberant growth are developing their wood buds slowly, and this is as it should be.

MELONS.—The earliest Melon plants are sufficiently advanced for planting permanently. A large border is not necessary; I have been successful with Melons grown in a narrow trough, so to speak, in a three-quarter span Pine-stove. No fermenting material was provided, only a layer of drainage material, and the space for the soil was about 10 inches deep and the same in width, with about 2 feet up to the wire support. The plants were easy to attend to in every respect. Two fruits were allowed to each plant, and the plants were set about 18 inches apart. A Pine-stove is not essential; any low house with a suitable temperature would be suitable. I have already stated that I favour the cultivation of early Melons, and even with nets it is not essential to provide fermenting material at any stage. I have used a hotbed and I have done without it, and I could not find any real advantage in its use. Pots of 12 inches diameter (8's) are a suitable size for Melons. Inverted Sealable pots are also excellent for the same purpose. These I have used from strong shelves near the roof glass with distinct success. In every instance, whether planted out or not, see that the soil is made firm, and make it firm whilst it is in a fairly dry condition. Good, friable, turfy loam needs no manure, but crushed mortar or rubble may be necessary. A small quantity of good soil goes further than double the quantity of inferior compost, and a heap of good loam will always repay its cost in fruit culture. Sow more seed for a succession.

THE FLOWER GARDEN.

By W. J. GRICE, Gardener to Mrs. DUMFRIES, Keele Hall, Staffordshire.

THE ROSE GARDEN.—The protecting material should be removed from Roses and in warm, sheltered districts some of the hardiest varieties may be pruned. The frost has injured the tips of the Rambler varieties, which should be thinned, retaining the strongest growths of last season. Certain varieties may be cut back closely, to cause them to break strongly. In all cases cut back to a bud pointing outward. The pruning of the more tender sorts is best left for another fortnight. Planting should be concluded without delay. Roses of the dwarf Polyantha section are very effective planted in the foreground of shrubberies, or on banks. They require very little pruning, and continue to bloom for a long period. Mrs. Cutbush, Orleans, Annie Muller, Dr. Ricard, Katherine Zeimet and Jessie are all good varieties. Jessie has flowers of a bright cherry crimson, and is very effective in masses.

THE ROCK GARDEN. Remove dead foliage and superfluous growths from Alpines and rock garden plants. With a small hand fork loosen the soil between the plants, exercising care not to disturb the roots in the process. In preparing composts for top-dressing the plants do not use animal manures. A gritty compost, consisting of loam, leaf-mould and coarse sand, with the addition of sandstone or limestone chippings, is suitable for many Alpines, but others need a mixture of loam, peat, and leaf-mould.

THE WALL GARDEN. Dry walls in which no mortar has been used may be covered with plants of a scrambling nature. The pockets should be made deep enough to hold sufficient soil for the roots. For growing in crevices select plants of a close growing nature such as *Alyssum*, *Arabis*, *Sium*, *Antennaria*, *Saxifraga*, *Hypericum*, *Moschata*, *Trollius*, *Veronica repens*, *Cypripedium*, and *Eidweiden*. On the top of the wall may be planted *Cerastium tomentosum*, *Androsace lanuginosa*, *Campanula fragilis*, *Androsace*, *Primula*, *Polygonum affine*, *Helianthemum*, *Lithospermum prostratum*, and *Saxifraga* in variety. Some of the smaller, close-growing varieties may be planted in the crevices of paved paths. Frequent waterings will be necessary until the plants are established.

EDITORIAL NOTICE.

Editors and Publisher.—Our correspondents should oblige by delaying in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, March 27.—Roy. Hort. Soc., Comms. meet. at Drill Hall, Buckingham Gate, Westminster.

WEDNESDAY, March 28.—Ann. meet. of The Nursery and Seed Trade Assoc., at 28, Gresham Street, London, at 3.30 p.m.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 43.1°.

ACTUAL TEMPERATURE:—*Gardeners' Chronicle* Office, 41, Wellington Street, Covent Garden, London. *Thursday, March 22* (10 a.m.) Bar, 29.4; temp., 39.5°. Weather—Sunshine.

SALES FOR THE ENSUING WEEK.

WEDNESDAY.—Sale of Fruit Trees, Rhododendrons, Roses, Gladioli and Lilies, at 67 and 68, Cheapside, by Protheroe and Morris, at 12 o'clock. Japanese Lilies in cases at 3.

THURSDAY.—Roses, at 67 and 68, Cheapside, by Protheroe and Morris, at 1 o'clock.

Research in Market Gardening.

The second report* of the recently established research station at Chesham is interesting, not only because of the summary which it contains of the investigations carried on during the past year, but also because it indicates the large scope of enquiry which is open to research into the cultivation of plants under glass.

As the director points out, the grower of market crops under glass possesses to a degree not met with in open-air cultivation the power to control the conditions under which his plants are grown. He is able to control, within wide limits, the soil, the temperature, and the water supply, and he can, if he chooses, supplement the light which the heavens afford him. It is true that so far no systematic attempts have been made to use artificial light to eke out the meagre ration of sunshine which falls to our lot during many months of the year, and it is likewise true that it is not yet known whether the cost of artificial light would be returned in the increased yield of produce. Only thorough investigation can determine

this, but with the advent of new and powerful half-watt lamps, it may prove that electricity has been brought within the reach of the market gardener.

Turning, however, from the purely speculative side of market garden research to the severely practical, it is interesting to observe that the Chesham research station is engaged in investigating the different types of "soft" growth known to practical growers. Softness of growth, which is inimical to fruitfulness, may be induced by more than one set of conditions—for example, by excess of moisture or by over-manning. Whether the softness induced by the one agency is identical with that called forth by the other remains to be determined. In addition to the larger problems, the solution of which will require a long period of investigation, the Research Station is engaged in working out what may be called special problems of immediate practical value. Among these is the question whether the addition of lime to fresh loam used for Tomatos is or is not beneficial. The series of experiments made to determine this point lead to the conclusion that the Tomato has no particular partiality for lime, and that the addition of either lime or chalk to fresh loam deficient in calcium compounds leads to no increase in the crop.

Tests with humogen led, both in 1916 and in the previous year, to negative results, and the experimental use of this substance at the Research Station has been abandoned.

There is so much ignorance in administrative circles of the importance of the market gardening industry that we hope that steps will be taken by the Research Station to correct this unfortunate state of affairs. A short statement of yield obtained from a given area of glass throughout the year as compared with agricultural yields might, we think, be prepared and included in the report. It should prove illuminating, and might lead to a healthy change of view on the subject of the importance to the nation of this great industry.

The Best Time to Spray.

Experiments carried out by Mr. A. H. Lees,* of the National Fruit and Cider Institute, lead to the conclusion that there is but little risk of damage from lime-spraying up to the time at which the buds begin to burst. April 10 may be taken as a safe date, though, of course, seasonal variations must be taken into consideration. In this connection we may recall Mr. Molyneux's statement in *Gard. Chron.*, April 1, 1916, p. 188, that lime spraying when the trees were in full blossom caused no injury, and that the fruits carried fine in the eye until the time of ripening. In the case of the Apple, the four chief pests against which lime-spraying is directed are the Apple sucker, the rosy Apple aphid, the blossom and stem Apple aphid, and the permanent Apple aphid. Of these pests the

Apple sucker begins to hatch, in normal years, during the beginning of April, and hatching goes on for about three weeks.

Since the rosy Apple aphid begins to hatch about the middle of April, a compromise with respect to the date of spraying must be effected.

Mr. Lees recommends the use of Jump lime of 98 per cent. purity, derived, if possible, from carboniferous limestone, and that common agricultural lime should not be used. The lime should be allowed to slake for six hours at least, and must be kept covered with water. The strength to be employed is 20lb. to 10 gallons of water, and the mixture of that strength should be strained through a metal sieve with sixteen meshes to the inch.

Contrary to expectations, the late spraying in a series of experiments, begun on March 17 and ended on April 28, had very little injurious effect. Until as late as April 25 no serious damage was observed in any of the many varieties which were sprayed, but on that date Lord Derby and Cox's Orange Pippin showed signs of injury, although the damage was not considerable.

Since, however, in Mr. Lee's experiment damage was occasionally sustained as a result of late spraying, he fixes the date already mentioned, April 10, as one on which risk of damage is so slight as to be negligible.

FORCING BY ACETYLENE.—The *Berke Horticult.* describes a new method of forcing by means of acetylene gas. The results are apparently similar to those obtained by etherification. An ordinary calcium carbide lamp is used, but not lighted, the gas being allowed to escape freely. Most plants remain in the forcing-house for 48 hours none more than this time—but in the case of Lilac 24 hours is sufficient after the middle of November. In order that the flow of gas may be as even as possible, it is well, if practicable, to renew the carbide two or three times. As to the quantity of gas to be used, roughly, for every cubic metre of air, 6 grammes a day are necessary. It is unnecessary to protect the roots, as the acetylene is not injurious to them. The forcing should be done in a warm house.

BRACKEN FOR FOOD.—MR. SHIPLEY, the gifted Master of Christ's College, Cambridge, has been entertaining the readers of the *Times* by descending on the hidden treasure, in the form of starch, which exists in the rhizomes of the Bracken. How this source of supply is to be made use of is not clear. To turn undergraduates, or even conscientious objectors to the digging of the rhizomes would result in the expenditure of more energy than the starch won from the soil would return to the diggers. To serve Bracken as Asparagus—if the opinion of those who have tried it is to be believed—would, we fear, not be acceptable, say, to the High Table at Christ's. For our part we would suggest that the best use to be made of Bracken is to use it for fire-litter. Cut in August, the fronds are still rich in nitrogen and have a fair amount of potash in them, and a stack of Bracken used as litter during autumn and winter will return in the manure a large proportion of these plant-foods.

GARDEN ALLOTMENTS IN SCOTLAND.—Glasgow Corporation has received applications for four thousand allotments, and nearly three thousand plots have been allotted. There is a surplus of ground in a few districts, but a great shortage in others.

* Experimental and Research Station, Turner's Hill, Chesham, 1916.

* *Journal of the Board of Agric.*, Feb., 1917.

SUNDAY LABOUR ON ALLOTMENTS.—The Glasgow Parks Committee, at a meeting on March 7, unanimously agreed to advise the Corporation to withdraw the regulation prohibiting Sunday labour on allotments. Maxwelltown Parks Committee has also had the same question under consideration, and has agreed to the suspension during the war of the prohibition of Sunday labour on the allotments under its management.

BOSTON FLOWER SHOW.—The Massachusetts Horticultural Society proposes to hold a flower show in the first two weeks of June, on the lines of the R.H.S. Chelsea exhibitions. The site selected for the show is in front of the Wentworth Institute in Huntington Avenue, and the principal exhibits will be staged in tents. Professor SARGENT, of the Arnold Arboretum, will exhibit *Azaleas*. An important exhibit from this country will be MESSRS. WATERER, SON AND CRISP's group of Rhododendrons. A guarantee fund of about \$10,000 has been formed.

ALLOTMENT GARDENS IN FRANCE.—We learn from our contemporary *Le Jardin* that the movement towards the cultivation of waste land and the formation of cottage gardens is proceeding apace in France, and already assumes important proportions. The War Minister has placed at the disposal of the Minister for Agriculture more than seventy professional horticulturists, many of them old pupils of Versailles, who are lecturing and directing operations in the gardens near the front. Monsieur LAUREN CHAVRE, who is now over military age, has left the Army, and undertaken the work of co-ordinating the activities in each commune, forming for each district a separate committee, which will in its turn superintend the work of allotment-holders and assign the required plots. In Paris the well-known "workmen's gardens" society, founded by the Abbé LEMIRE, has undertaken to cultivate the ground around the fortifications, of which there is much still uncultivated, and for which volunteers are being invited to apply. Monsieur M. DEBROCK, the director of allotment gardens to the Minister of Agriculture, is devoting much energy to the task of bringing into cultivation all the waste land in the suburbs of Paris. All over the country the allotment gardens are increasing in number, and men (civilians over military age, and soldiers on leave), women and children are all taking up the work with enthusiasm. The work of children of school age is being organised very thoroughly, and an appeal to all school authorities has been sent out from the Ministry of Agriculture with a view to utilising the help of the scholars in the best way. The Minister of Public Instruction has arranged for the closing of the primary, secondary, and normal schools for a period of from 15 to 20 days at Easter, beginning with the last week in March, to allow the school children of France to help with the spring farmwork, especially the planting of Potatoes. It is expected that by this means four million young workers will be set free. There will also be 29,000 boys and 25,000 girls from 15 to 18 available from the secondary schools, and 50,000 boys and 50,000 girls from the lycées and colleges to speed up the harvest.

GARDENER CENTENARIAN. We have pleasure in reproducing the portrait of Mr. T. PYPER, 52, Red Lion Lane, Hemmer-smith, who celebrated his 100th birthday on February 5 last. He was born in Bess-shire, and whilst still a child was taken to Edinburgh, where his father was engaged in laying out the gardens in Prince's Street. Later on he was apprenticed to Mr. MCXAR, who was superintending this work. His first appointment in England was at Lord VERNON'S, at St. Hilary Hall, Derby. About 1840 he went to Chatsworth, and was employed for a time under Sir JOSEPH PAXTON, the Duke of that day showing marked appreciation of his work. Leaving Chatsworth,

he went to Lord LECONFIELD'S, at Petworth, and to Mrs. RAE'S, in Gloucestershire. Mrs. RAE appears to have been one of the first to take up Orchid growing, and under her instruction Mr. PYPER became a skilful grower. This experience with Orchids led to an engagement with Lord DICBY at Minterno, which lasted for twenty years. On leaving Minterno, Mr. PYPER went to Melton Constable, where he remained for ten years, only leaving on the death of Lord HASTINGS, and with the approval of the executors of the estate. After a short interval, he was appointed gardener to Colonel PENNY and his sister, Lady SMITH, at Somerton Esleigh, in Somersetshire. Here he remained for over twenty years, this engagement practically ending his active career at the age of 78. Very shortly after this, having been a regular subscriber to the Gardeners' Royal Benevolent Institution for many years, and having been unfortunate enough to lose what little money he had saved, he was elected to the benefits of the Institution. Mr. PYPER enjoys good health, but it is only just possible for him to sign his name owing to impaired eyesight.

WAR ITEMS.—Captain PHILIPPE RIVOIRI, secretary of the French Chrysanthemum Society, after doing military duty as a reserve officer

M. LÉONARD LILLÉ, WHO RECENTLY CELEBRATED HIS 100TH BIRTHDAY.

since the beginning of the war, has been released from service, and is back in Lyons. He hopes in the near future to revive the publication of the society's official journal, *Le Chrysanthème*. The nursery of Messrs. RIVOIRI, PERE ET FILS has been closed since the beginning of the war, but their seed business is being carried on. Similar information reaches us in regard to M. LÉONARD LILLÉ'S nursery.

We learn with regret that Mr. WILLIAM EDWARD DOR, son of Mr. Dor, gardener at Parkwood, Henley-on-Thames, has been killed in Mesopotamia. The deceased soldier was a member of the garden staff at Rangemore. Mr. Dor, *senr.*, has three sons in the Forces; the eldest, Sergt. E. Dor, is at Salonika, wounded.

PUBLICATIONS RECEIVED.—*Lawn Tennis Almanac*, 1917. (London: F. H. Ayres, Ltd., 111, Abchurch Lane.) Price 1s. 6d.—*Rational Fruit Culture*. By H. C. Davidson. (London: Garden Life Press, Hatton House, Great Queen Street.) Price 2s. 6d.—*The Commercial Absorption of Ex-Naval and Military Men*. By Lionel Vexley. (London: The Fleet, Ltd., 11, Henrietta Street, Covent Garden.) Price 2d.—*Plantae Wilsonianae*. Vol. III., Part III. By C. S. Sargent. (Cambridge: The University Press.)—*Herb Collecting for Boys and Girls*. By Mrs. T. Chamberlain and Miss E. C. Wheelwright. (London: National Herb Growing Association, 44, Queen Anne's Chambers, S.W. 1.) Price 3d. Second edition.

HOME CORRESPONDENCE.

POTATO DIFFICULTIES.—Of the recent Potato regulations, one rule is still in force which will do great mischief if not relaxed. I refer to the regulation that all seed Potatoes not sold by April 1 will have to be sold as for eating, or at the price fixed for eating. Owing to the abnormal season and scarcity of labour, a large quantity of land intended for Potatoes is still untilled, and probably a large proportion will not be ready for planting until May is well advanced. Are all the small growers who have not much storage room to be deprived of the chance of obtaining seed tubers unless they are ready to plant by April 1? The seedsmen are approaching the authorities through their Association to obtain a relaxation of this regulation, as the matter affects almost all gardeners and next season's food supply. *Charles E. Pearson, Secretary to the Horticultural Trades' Association.* [Since this letter was written the Ministry of Food Control has announced that it is prepared to grant licenses to seedsmen to sell hand-picked seed Potatoes of any variety up to 56 lbs. of one kind, at the prices advertised in catalogues that were already in circulation, the sale under these conditions being permitted up to May 31. Licenses to be applied for by individual firms, accompanied by a copy of their catalogues, to the Secretary, Ministry of Food Control, Grosvenor House, Park Lane, London. Eds.]

THE FROST AND THE GARDEN.—Sir Herbert Maxwell is to be congratulated not only on his delightful pictures of his Galloway garden, but on the charmed life of the plants he tends and knows so well. Here in the South of England the frost has played havoc, and has destroyed or crippled not only rare, but many of the common things. The tree Laurus look woebegone dry sticks. The leaves of Portugal Laurels are dirty coloured, the distal halves dead and brown, the stalks green. *Olearia macrodonta* has cast off most of its leaves. Wallflowers are crippled and Stocks look as though they had been trampled on. *Lithospermum* are burned as with fire, and *Helianthemum scosus* to have disappeared. This is not a complaint, but an attestation, and no doubt things are by no means as bad as they seem. For instance, although autumn-sown Cabbage has gone the way of the Stocks, Peas sown in the autumn, which were showing through the ground when the frost and cold winds came, have survived the ordeal, and are beginning to grow vigorously. To one can have any ground when the Grasses have come, but now all traces of them in the Grasses show when the Earth like the tips of the Grasses show their green, when the exquisite first young leaf of the *Strawberries* appear, and the fruit buds of the *Prunus* begin to show like mosaics of mother of pearl. Of the more tender things, which have suffered I will not speak, lest I should disprove my contention that I am only recording, and not lamenting. J. V.

RHS AND THE PURCHASE OF BOOKS.—The one who read the report of the annual meeting of the Royal Horticultural Society in your issue of last month may remember that I suggested that the time had come for the committee to have some real power. The following incident, which has taken place since the meeting, shows (noted as it is typical of the conduct of the Council, and I think abundantly justifies my suggestion.) Acting on what was said by the above, that on that occasion, I reported a rare French work by Rivoiri to the chairman of the Library Committee as a suitable purchase. The book was sent by the dealer on approval, and it was refused. But by whom? By the Library Committee, which presumably exists for the purpose of advising about book buying, and whose members are believed by the public to be experts? No. No meeting of this body was called. The Council evidently did not think it was worth while to summon it, although in the case of an expensive work, and a very rare one, a committee would naturally think they would have done so. No; they sat on it themselves. First, Who does the Library Committee come in? and Why have a committee at all if this is how it is to be treated? Some members of the R.H.S. think the Council's ways want mending. Verbum sat sapienti. *Joseph Jacob, Whitwell, Salop.*

SOCIETIES.

ROYAL HORTICULTURAL.

(Concluded from p. 120.)

Floral Committee.

Present—Messrs. H. B. May (chairman), Chas. E. Shea, W. P. Thomson, C. Dixon, W. Cuthbertson, J. Dickson, A. Turner, John Heal, G. Reuthe, Geo. Harrow, W. J. Bean, John Green, J. F. McLeod, A. G. Jackson, E. F. Hazleton, Chas. E. Pearson, H. Cowley, E. H. Jenkins, John Jennings, R. C. Nottcutt, W. B. Cranfield, Jas. E. Hudson, J. W. Barr and George Paul.

The following medals were awarded to groups—

Silver Flora Medals to Messrs. R. and G. CUMBER, Southgate, for *Lachenalia Nelsonii*. The plants were remarkably well flowered and model specimens in every respect. Messrs. W. CRIBBS and SON, Highgate, for forced shrubs.

Silver Banksian Medals to Messrs. STRAIGHT LOW and CO., Enfield, for *Carnations* and *Cyclamens*. Their new *Cyclamen Cherry Ripe* (see fig. 45), was conspicuous amongst other varieties by reason of its brilliantly-coloured flowers, which are a glowing carmine; Messrs. H. B. MAY and SONS, Edmonton, for *Ferns* and *greenhouse flowering plants*; and Mr. J. JENNER, Liverpool Nurseries, Rayleigh, for *Perpetual-flowering Carnations*.

Bronze Flora Medals to Messrs. ALLWOOD BROS., Wivelsfield, Haywards Heath, for *Perpetual-flowering Carnations*; Messrs. BARR and SONS, King Street, Covent Garden, for trays of hardy bulbous flowers; Messrs. JAMES CARTER and CO., Raynes Park, for *Primula macleoides King Albert*, a very charming plant, with a profusion of rosy-mauve-coloured flowers; Messrs. J. CHEAL and SONS, Crawley, for a miscellaneous group of hardy flowers and shrubs; and Mr. G. REUTHE, Keston, Kent, for hardy flowers.

Fruit and Vegetable Committee.

Present: Rev. W. Wilks (in the chair), F. Perkins, W. H. DIVERS, G. P. Berry, E. Harries, J. C. Allgrove, A. R. Allan, H. Markham, J. G. Weston, A. Bullock, E. A. Bunyard, A. W. Metcalfe, and E. Beckett.

Messrs. W. SEABROOK and SONS, Chelmsford, showed seventy-four varieties of Apples, for which a Silver Knightian Medal was awarded.

Mr. EDWIN BECKETT, Aldenham House Gardens, Elstree, showed his new *Onion Autumn Triumph*.

Narcissus Committee.

Present: Mr. E. A. Bowles (in the chair), Miss E. Willmott, Messrs. W. Pount, G. Leak, G. Reuthe, F. H. Chapman, W. B. Cranfield, Joseph Jacob, G. Mouro, H. Smith, P. R. Barr, J. D. Pearson and C. H. Curtis.

Messrs. R. H. BATH, LTD., Wisbech, were awarded a Silver-gilt Flora Medal for a large exhibit of Daffodils and Tulips grown in bowls of fibre.

A Bronze Banksian Medal was awarded to Mr. G. W. MILLER, Wisbech, for an exhibit of hardy bulbous flowers.

Orchid Committee.

GROUPS

Sir JEREMIAH COLMAN, BART., Gatton Park, Surrey (gr. M. Collier), was awarded a Silver Flora Medal for a group of finely-grown and profusely-flowered *Dendrobiums* raised at Gatton. The new forms were *D. Gatton Jewel* (*Bartelsianum* × *melanolicum*), a pretty white flower with cream-yellow base to the lip; *D. Gatton Monarch* (*Lady Colman* × *nobile* Harefield Hall), white, tipped with rosy-lilac, the lip having a dark purple centre; *D. Helms Wigania* (*signatum aureum*), primrose-yellow with a slight rose tint on the petals; and *D. Lady South-walk* (*Lady Colman* × *Chessingtonense*), a fine white flower with a shade of yellow. The lip is dark purple in the centre, the apex being rose-colour.

Messrs. CHARLESWORTH and CO., Haywards Heath, were awarded a Silver Flora Medal for an effective group of fine *Odontoglossums*, *Odontiodas* and *Laelio-Cattleyas*.

Messrs. ARMSTRONG and BROWN, Orchidhurst,

Timbridge Wells, were awarded a Silver Flora Medal for a good group containing a fine selection of *Odontoglossums* and *Odontiodas* flowering for the first time. Large size, perfect form and fine substance characterises the whole strain, and some new departures in the disposal of the colours were noticeable, a special example being *Odontoglossum Baghdad*, which has wax like white flowers with concentric clusters of purple spots on the segments.

Messrs. SANDER and SONS, St. Albans, staged a group which included *Lycaste Sküeneri* G. Hamilton Smith, probably the largest form of the species and good in all respects; good white hybrids, including a *Laelio-Cattleya Trimyra* var. *Charm*, a clear, milk-white flower with orange centres; *Cattleya Mary Sander*, and *C. Snow Queen*, of fine quality.

Messrs. FLORY and BLACK, Orchid Nursery, Slough, showed a darkly blotched hybrid *Odontoglossum*, a finely-coloured seedling *O. crispum*, a good form of *Dendrobium nobile*, and the white *Cattleya Suzanne Hæ de Cron*.

PANTY RALL, Esq., Ashford Park, Surrey (Orchid grower Mr. W. H. White), sent *Cattleya Apelles* (White) × *Mendeli* var. *King George V*), a good flower with white sepals and petals tinged with bright purple.

FIG. 45.—CYCLAMEN CHERRY RIPE: COLOUR OF FLOWERS BRIGHT CARMINE (R.H.S. Award of Merit, February 27, 1917.)

TRIALS OF SAVOYS.

The further following awards have been made by the Council to Savoy Cabbages after trial at the Wisley gardens:

AWARDS OF MERIT.

Green Curled, sent by Messrs. Dobbie and Co., Edinburgh; *Late Drumhead*, sent by Messrs. Nutting, London; *New Year*, sent by Messrs. Sutton, Reading; *Ormskirk Late Green*, sent by Messrs. Sydenham, Birmingham; *Ormskirk Harlequin Selection*, sent by Messrs. A. Dickson, Newmarket; *Ormskirk*, sent by Messrs. Nutting, London.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

MARCH 1. *Committee present*: The Rev. J. Crombiedine (in the chair), Messrs. R. Ashworth, D. A. Cowan, J. C. Cowan, Dr. Craven Moore, J. Cypher, A. G. Ellwood, J. Evans, P. Foster, A. R. Handley, A. J. Keeling, D. McLeod, W. Shackleton, H. Thorns, and H. Arthur (secretary).

AWARDS

FIRST CLASS CERTIFICATES.

Laelio Cattleya Linda (*L. C. Trachin* × *C. aurea*), from R. ASHWORTH, Esq.
Odontioda Guitierrezii (*Od. seedling* and *Od. Rands-haerum Cookson's var.*), from S. GRAVIX, Esq.

AWARDS OF MERIT.

Cymbidium Sgill Congyglow var. (Pauwelsii × chinensis), and *Odontoglossum tauchristensis Congyglow var.*, both from Dr. CRAVEN MOORE, Esq.
Cypripedium Clarke var. compactum, and *Odontioda Dorothy*, both from P. SMITH, Esq.
Odontioda Madeline var. Evansae, from R. ASHWORTH, Esq.

Odontioda Hargyi, from Messrs. ARMSTRONG and BROWN, Esq.

Odontoglossum Mary (amabile × crispum Franz Maserdy), from S. GRATIAX, Esq.

Cymbidium Alexanderi × Yvonne, from J. WALKER, Esq.

Cypripedium Iowa Carter Place var., from T. WORSLEY, Esq.

AWARDS OF APPRECIATION.

Odontoglossum James O'Brien (Dunroverianum × Harringtonae)—1st class—and *Odontoglossum Distinctum*—2nd class—From R. ASHWORTH, Esq.

Odontioda crinum Papillon—1st class—From Dr. CRAVEN MOORE.

Odontoglossum Fabin (L. Aiglon × crinum), from Messrs. ARMSTRONG and BROWN.

SCOTTISH HORTICULTURAL.

MARCH 6.—The monthly meeting of this Association was held at Edinburgh on this date, Mr. John Phillips, the president, being in the chair.

Mr. J. W. M'Hattie, Superintendent of Parks and Gardens, Edinburgh, read a paper on "Garden Allotments." He dealt with the preparation and manuring of the soil, the best crops to grow, dividing them into summer and autumn, and winter and spring groups respectively, and he emphasised the necessity for growing vegetables of a substantial kind, thus making the most of the allotments, which numbered approximately twenty to the acre. He concluded by giving directions as to cultivation.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

ANNUAL MEETING.

MARCH 12.—The annual general meeting of the above Society was held at the Royal Horticultural Hall, Westminster, on the 12th inst. Mr. Chas. H. Curtis presided. The chairman presented the annual report of the committee, and drew attention to the fact that, owing to the Government regulation that all friendly societies must make up their accounts to December 31 in each year, the period under review consisted of eleven months only. He stated that a sum of £1,200 had been invested in War Loan. Thirty-eight members had died during the past year, including twenty-five engaged with the Forces.

The finances of both sections were stated to be in an eminently satisfactory condition.

The adoption of the report was moved and seconded and adopted unanimously.

The secretary, treasurer, and retiring members of the committee were all re-elected.

The meeting afterwards resolved itself into a special general meeting, to consider the proposed alterations of rules and the formation of a Juvenile Branch of the Society. The altered rules provide for a sliding scale of contributions from new members; allow certain insured members to again contribute to Scale A; and give "preferential treatment" to members who have joined H. M. Forces and have fallen into arrears.

It was unanimously decided to form a Juvenile Section of the Society, and subject to ratification by the Registrar, the section will consist of "males between the age of 12 years and 16 years who propose to follow the horticultural profession."

Obituary.

GEORGE BURT.—We learn with regret of the death, on the 11th inst. of Mr. George Burt, aged 75. Mr. Burt was appointed gardener at Broomfield Hall, Sunningdale, in 1862, to the late J. Rice, Esq., and served there for 27 years. On the death of Mr. Rice, he engaged in landscape gardening for 18 years, and had a good local patronage. A Dorsetshire man, he gained his experience in good private establishments.

DEBATING SOCIETIES.

WARGRAVE AND DISTRICT GARDENERS.

With commendable energy the members of this Association have undertaken to give as much assistance as possible to allotment holders and other cultivators. On Wednesday, the 14th inst., Mr. Thos. Hasket, Gardener to Mrs. Rhoads, Hennerton, gave a lecture on "Potato growing." About 100 were present. The hon. secretary, Mr. Coleby, showed several interesting and easily made experiments respecting the use of lime in the soil, and several gardeners spoke on certain points raised in the lecture.

READING AND DISTRICT GARDENERS.—At the meeting of this Association, held on the 5th inst., Mr. W. F. Giles, of Messrs. Sutton & Sons, gave a lecture on "Salad Plants." The lecturer enumerated and briefly described most of the cultivated salads, including Lettuce, Beet, Tomatoes, Cucumbers, Celery, Celeriac, Endive, Radish, Onions, Mustard, Cress, Watercress, Chervil, and Dandelion. Lantern slides, reproduced from photographs taken in England, France, Holland and Italy added greatly to the interest of the lecture. — On the 19th inst. before the members of this Association, Mr. T. Parrot, chairman of the Beth Gardeners' Debating Society, gave a paper on "The Growing of Large or Exhibition Fuchsias." A first-class coral certificate was awarded to Mr. A. H. Fuller, The Gardens, Elmhurst, for a large, excellent Fuchsia in cordons, and a similar award was made to Mr. D. Turner, The Gardens, Coker Park, for plants of Cyclamen, carrying large flowers and beautiful foliage.

ABERAMAN HORTICULTURAL.—At the meeting of this Society, held on the 7th inst., Mr. A. J. Cobb, of London Gardens, Cardiff, gave an address on "How to Grow a Ten-perch Plot."

GARDENING APPOINTMENT.

Mr W A Baldwin for 10 years Gardener to T J Lewis Bowen, Esq., Clifton, Bristol, Pembroke Square, is Gardener to the Lady BENNING, Melton in Goring, Berkshire.

CATALOGUES RECEIVED.

T H WEBSTER, Stock, Essex. Catalogue for 1917.

MARKETS.

CROWN GARDEN MARKET.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing market prices for various cut flowers and plants. Columns include item names (e.g., Anemone, Tulips, Carnations) and their prices per dozen or bunch. Prices range from 0.50 to 10.00.

French Flowers, &c.: Average Wholesale Prices.

Table listing market prices for French flowers and plants. Columns include item names (e.g., Allium, Anemone, Freesia) and their prices per dozen or bunch. Prices range from 0.50 to 6.00.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing market prices for cut foliage and plants. Columns include item names (e.g., Adiantum, Asparagus, Fern, Myrtle) and their prices per dozen or bunch. Prices range from 0.50 to 15.00.

Remarks.—Business in plants is improving. There may now be had various in variety, Boninas, Erica, Primula, E. White-veina, and Anemone. All French are improving in quality, but flowers are more plentiful than in former weeks past. Large quantities of blooms are arriving from the Channel Islands, consisting chiefly of Anem. in single and double Dutch, Bellis, Narcissus, Soliel-d'Or, Narcissus Grand Prince, and Pansy White. Coloured flowers are much in demand, and white flowers, although in smaller and a ready sale. Single Violets are more plentiful and the blooms are larger. R's'sials are more plentiful, the varieties include Madame A. Chateaux and Joseph Lowe. Sueda, a large variety of French flowers, consisting of Anemone, large double and single, Anem. (Mimosa), white and pink Stocks, Allium (see B. Bulletin), and Parma A. flowers arriving daily. Single Violets arrive from the Netherlands.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing market prices for plants in pots. Columns include item names (e.g., Aralia, Asparagus, Aspidistra, Cineraria) and their prices per dozen or per tray. Prices range from 0.50 to 12.00.

Vegetables: Average Wholesale Prices.

Table listing market prices for various vegetables. Columns include item names (e.g., Artichokes, Asparagus, Beans, Broccoli, Broad Beans) and their prices per dozen, per bag, or per bushel. Prices range from 0.50 to 15.00.

Remarks.—There are larger quantities of boxed Apples on offer this week, but none in barrels are offered. The supplies of Grapes (from Germany) are limited. A few forced Strawberries are now available and English Tomatoes are commencing to arrive. French Beans and New Potatoes are in short supply. Most of the Mushrooms, Sea-kale and Cauliflower in the market are from France. Broad Beans, Spinach and Parsnips are arriving from Broadbalk in some quantities. English Chervil and Hamburg Parsnips are in short supply. There are fewer Parsnips, but good quantities of Swedes.

CROPS AND STOCK ON THE HOME FARM.

POTATOS.

Tubers set up in boxes for sprouting require plenty of air to induce a stocky growth. Surplus sprouts may be removed during wet weather, and if such work be done now it will help things forward. When the "seed" is lying in bulk the tubers should be discouraged to grow by frequently turning them over, for when the sprouts grow in a mass they are useless, merely weakening the tubers. An extra ploughing of the land should be done to provide a finer tilth. The end of the month is a suitable time for planting.

POTATOS ON GRASS.

As my remarks on this subject on p. 120 may be misconstrued and deter some from planting this crop on grass land, I may state that I do not advise Potatoes to be planted on newly-ploughed grassland, for the reason that there would not be sufficient depth of soil to earth the plants well, and the planting would not be easily done except by hand.

Ordinary ploughing only disturbs the soil to a depth of 4 inches to 6 inches, but if a second plough were used in the same furrow and sufficient soil thrown on the turf to bury the grass deeply the circumstances would be considerably altered, and success could reasonably be expected. I was anxious not to recommend any method of culture that might end in disappointment.

Where a grass plot is to be planted with Potatoes by hand the circumstances are entirely altered, as the turf can be buried one foot deep, which is ample for all purposes of cultivation, and with animal or artificial manure added success would follow.

CHARLOCK.

In many counties on light soils Charlock (Brassica sinapis) is a terrible pest among spring-sown crops, such as Oats, Barley and roots. The seed of Charlock can lie dormant in the ground for many years, and directly deeper ploughing is practised a crop will appear. Autumn sown Wheat and Oats are not affected, as Charlock cannot withstand frost. The most efficient remedy is spraying annually with copper sulphate directly the first rough leaf has formed. No harm is done to the corn crops by spraying, though it may turn the leaves a little brown at the tips. This discoloration quickly passes off, but Turnips, Vetches, Mangolds, and any plants with a rough leaf surface must not be sprayed, as the solution adheres to the leaves as in the case of Charlock, and injures the plant. For corn land a 3 or 4 per cent. solution, or 30 or 40 lb. of copper sulphate to 100 gallons of water, is a safe quantity to use, with a sprayer which distributes the solution in the form of a fine mist. Fifty gallons per acre is sufficient.

JERUSALEM ARTICHOKE.

In view of the scarcity of seed Potatoes, tubers of Jerusalem Artichoke, if available, should be planted for a crop. In well manured, deeply ploughed land the tubers should be at once planted in every third furrow at 15 inches apart.

BRIEF REMINDERS.

OATS.—No time should be lost in sowing Oats provided the land is in a fit condition to receive the seed, remembering that early-sown plots give the best returns in corn and straw, and the crop ripens earlier, which means much at harvest time. GRASS FOR HAY.—"Lay up" the pasture from which hay is to be cut this season. If there is any doubt about the richness of the soil being sufficient to give adequate results, some assistance should be given in the shape of artificial manure. A dressing of 4 cwt. of superphosphate, 2 cwt. of sulphate of ammonia, or 1 cwt. of nitrate of soda per acre would give a fillip to the growth of the grass previous to harrowing, which is beneficial in scattering droppings and removing moss. Afterwards, firmly roll the surface, for this attention will prove of much value when cutting the grass. Apart from leveling such obstructions as mole hills, repeated harrowing and rolling favours the growth of the grass. Where obtainable, a compost of decayed manure, vegetable refuse, wood ash and quicklime would make a vast improvement on the growth of the turf, producing close, sweet herbage. E. Molyneux.

ANSWERS TO CORRESPONDENTS.

COLD STORAGE FOR LILiums: *O. H. L.* You do not state what acids are used to produce the temperature of 23°, nor whether you can maintain this temperature steadily throughout the period of storage. We cannot advise you without this information.

CULTIVATION FOR ALLOTMENTS: *W. J. M.* The Planet Junior combined cultivator and horse-hoe, with its fittings for various kinds of work, is a very useful implement for a small holding, market garden, or large allotment. It should not be a large-size implement if only one horse is to be used with it, to work it all day, or even more than a few hours at a time. There are ploughing attachments to a large-size cultivator, but the illustrations of them do not seem to show that any considerable depth of soil could be turned over by them. We have no experience with the Retro-force implement.

EXTRACTION OF SUGAR FROM BEET: *Nonon and Young Reader.* We are afraid that the extraction of sugar from Beetroots cannot be undertaken successfully in a small way with ordinary household utensils. It needs special plant. The roots are cut into slices and put into big communicating kettles. Water runs through these and extracts the sugar by diffusion. During the process the amount of sugar increases progressively, and the water forms a juice containing, besides sugar, mineral salts which have to be eliminated. Special plant is used to "lime" the juice, then a saccharate of lime is formed, which is separated from the other salts by other machinery again is required to eliminate the lime through "carbonation." Finally the solution of sugar has to be concentrated in order to come to crystallisation. The machinery is complicated and expensive, and a regular supply of roots from a large acreage is necessary before a factory can be started with any chance of success. Extracting sugar at home by macerating the root slices in water and evaporating would involve a large waste, both of sugar and of fuel. It is much more economical to eat the roots raw in salad and cooked as a vegetable. Then the digestive system does the extraction free of cost.

FANSEL WEED IN A POND: *G. W. B. G.* Skim off as much of the weed as possible and treat the water with copper sulphate, as you suggest. First ascertain the amount of water in the pond by multiplying together the average length, breadth and depth, and multiplying the number of feet thus obtained by 64, the approximate number of gallons in one cubic foot. Then, to every 100,000 gallons of water take 1 pound of copper sulphate, break it up, and enclose in a bag of loose texture. Draw the bag backwards and forwards through the pond in parallel lines 10 or 20 feet apart. The sulphate will dissolve and become diffused throughout the water, killing all the weeds. If used in the proportions given above the copper sulphate is not likely to injure fish, and may even benefit them by ridding them of parasites.

GARDENING ENGAGEMENT UNDER THE REGISTERED OCCUPATIONS ORDER: *M. S.* The Order was dated February 23, 1917, and directed that after that date men, between the ages of 16 and 60 inclusive, in the various scheduled trades (including domestic service, both indoor and outdoor) should not be freshly engaged. We understand from your letter that your engagement was entered into and finally completed on February 23 last. It would seem therefore that the Order does not apply to you, although it would have done so had you accepted the post on the following morning. If your engagement should fall through, and you find it impossible to make a livelihood except as a gardener, you should communicate with the Director-General of National Service, St. Ermin's, Victoria Street, Westminster.

GARDENER'S WAGES DURING ILLNESS: *H. M.* The fact of your being insured does not entitle your employer to refuse to pay your wages on account of illness. If your employer wishes to escape liability his proper course is to give you the usual notice to terminate your engagement.

GLASS SUBSTITUTE FOR FRAMES: *W. H.* The best material for your purpose is the special oiled paper sold by the Willsons Paper and Canvas Company, Willsons Junction, London, N.W.

HEPATESTRUM (AMARYLLIS) BULBS: *J. M., Ocean.* The red staining on the bulbs may have been caused by mites, and the remedy would be to spray them with an insecticide or dust with flowers of sulphur. To destroy the newly big sponge the plants occasionally with a weak insecticide. If the plants are in a bad condition, and do not promise to flower for some time, turn them out of their pots, cleanse the leaves and bulbs thoroughly, remove decayed portions of the roots, and dip them in weak insecticide. In re-potting, use rather smaller pots than the plants previously occupied.

LITTER FOR STRAWBERRIES: *Miss E.* It is the practice of many to use littery material instead of straw, which, you state, you cannot obtain. The litter should be applied before the flower-spikes develop in order that there may be time for the rains to wash the straw clean, and it will be bleached by the sun. Alternatives are to use peat litter or cocoa-tub fibre.

LYCASTE SKINNERS: *Bonchait.* Lycaste Skinner does not commonly bear two flowers on one inflorescence, but exceptionally well-grown plants sometimes produce twin flowers. We have seen a specimen with all the flowers in pairs. Examination of the spike above the bract will often disclose a rudimentary bud, which, failing excessive vigour, remains dormant. The same thing happens with *Cypripedium* insignis and other Orchids which usually bear but one flower, when they are well-grown. With regard to the spotting of the pseudo-bulbs in former years, it is very probable that the addition of lime to the compost has been the cause of the pseudo-bulbs being free from "spot" this season.

MANURES FOR POTATOS: *Constant Reader.* Dig the lime into the soil now, scatter the superphosphate at the time of making the rows, and use the sulphate of ammonia and wood-ash when disturbing the soil in earthing-up the plants.

NAMES OF PLANTS: *M. S., Altrincham.* Hoffmannia (Cheshboughtii, sometimes called Hegensia and Camphylotrys in gardens.—*Constant Reader.* Chlorophytum elatum variegatum (the green leaf with yellow edge); Ophiopogon japonicus variegatum (yellow with green markings). The others send when in flower, and number the specimens.—*P. J. W.* The leaf is of a *Criminum* of the *C. Moorei* and *C. Powellii* section. The plant should be grown in a greenhouse or conservatory, and watered in the usual way until the leaves fade in the end of the summer, when water should be withheld until growth commences again. If planted deeply in a sheltered situation on the open ground, at the foot of a wall, or a plant-house for preference, it would probably prove to be hardy in winter. We do not recognise the portion of root-stock. *Lilium auratum* should be kept in the frame until growth is well advanced, when the plant should be removed to a greenhouse.

NEWLY-PLANTED RASPBERRIES: *Constant Reader.* Cut the canes to within 1 foot of the ground.

OVERHANGING TREES: *J.* Your neighbour is entitled to cut off those portions of your trees which overhang his land, but it would be a very unneighborly act on his part if he did so without first discussing the matter with you in a friendly way. He cannot, however, enter upon your land for the purpose unless he first notifies you of his intention so to do. If he cuts off anything more than actually overhangs his land you can bring an action against him. The boughs which are cut off would still belong to you.

STRAWBERRY ST. ANTOINE DE PADOUÉ: *S. Jack-son.* To obtain a supply of good fruits of Strawberry St. Antoine de Padoue during the late summer and autumn, remove all but four or five of the earliest runners on each plant as soon as they develop. These runners should be encouraged to root where they grow, and they will come into bearing at the time stated above. The plants do best in a hold-

ing soil, liberally treated and well supplied with water. The present is a suitable time to make new beds, allowing a space of 2 feet between the rows and 18 inches between the plants. Make new plantations every third, fourth, or fifth year, or when the plants show signs of falling.

TIME FOR INTERVIEWS: *Landford.* You enquire whether you cannot claim time off to keep an appointment with a prospective employer. As we presume you mean time that would naturally be spent in work, we think the matter is one for arrangement between yourself and your present employer; but it, after being asked for permission, he refuses, we think it would be better for you to fix any future interviews at such hours as will enable you to keep them in your spare time.

TREATMENT OF CODIAEUMS (CROTONS) AND EUPHOBIA PULCHERRIMA (POINSETTIA): *Chick, Horsely.* The present is a suitable time to strike cuttings of Crotons. Place the cuttings singly in small pots and plunge them in a propagating case with a bottom heat of 80° to 85°, and keep the frame close until the cuttings are rooted, when they should be inured to more light and air gradually. Another method is to cut the stem nearly half through, and bind damp moss around the cut part. Crotons and Poinsettias should be potted in friable loam mixed with a little peat or leaf-mould and sharp sand. Put plenty of drainage material in the pots, for during their growing season the plants need plenty of water; shade them very lightly. If the atmosphere is kept well charged with moisture, Crotons will not suffer from an excess of heat, therefore frequently syringe the stages and floors morning and evening, but do not drench the plants overhead. Suitable temperatures during the winter months are 60° to 65° by night and 65° to 70° by day; in summer, 70° at night, rising to 85° or 90° after closing early, with sun heat and moisture. Ventilation should only be admitted at the top of the house, and regulated in accordance with the weather. Poinsettias should be dried off gradually and the pots placed on their sides under a greenhouse stage, where the temperature does not fall below 45°, about the middle of May, water the roots and place the plants in a light house to form suitable shoots for cuttings. Make the cuttings with a heel, when the shoots are about 5 inches long, and insert them in small pots filled with fine soil and sand. Their treatment should be the same as for Codiaeums (Crotons). The old plants may be cut back to within 3 inches of the current year's growth, the soil shaken from the roots, and repotted into pots a size larger than they occupied before. Shade the plants in the middle of hot summer days, and towards autumn, as they develop in growth, gradually increase the amount of ventilation. Grow both the Poinsettias and Crotons close to the roof-glass.

VINES SPLITTING: *B. W. B.* The splitting of your Vine rods was doubtless due to frost acting on immature growth. Probably the stopping of the shoots was not attended to at the right time, and the growth overlapped, thereby obstructing the light from where it was most required, and growth continued late in the season when the sunlight was feeble. The consequence was that the cells contained more water than they usually do in winter, when the canes have ripened properly, and the expansion of this water under the action of frost caused a rupture, and with the subsequent warmth the cracks opened wider. The wounds will heal in the course of the season, but in future you must remember that leaves situated where daylight cannot reach them are useless, and so are those made late in the season. If the protective outer bark was removed from your Vines (a practice which is not yet obsolete), the frost would be better able to freeze the sap. We doubt the accuracy your thermometer, which indicated 50° of frost, and yet tender plants in a cold house were not much injured.

NOW IS THE TIME TO PLANT

KELWAY'S Gladioli Bulbs (all British), if you wish to have a glorious display of flowers in the autumn when blooms are scarce.

Kelway's, the champion growers of Gladioli, are offering a wide selection of beautiful varieties in all colours at greatly reduced prices during the war.

Write at once for their illustrated catalogue, and make a selection that will enable you to send flowers to the Wounded Soldiers in Hospitals and Nursing Homes from July till the frosts come. Gladioli are invaluable for cutting, as every bud opens in water. They last for a fortnight, and are so bright and cheerful that they are particularly well suited to Involve. For decoration of all kinds the Gladioli Kelway is pre-eminent.

Carrriage paid and packing free for prepaid order.

THE BOOK OF THE MOMENT.

Root & Stem Vegetables

By ALEXANDER DEAN, V.M.H.

At the present crisis the food problem bulks largely. The question of which vegetables contain the most food is a pressing one, and it is found that root and stem vegetables, such as Potatoes, Carrots, Turnips and Parsnips, contain much higher percentages of food value than green vegetables, valuable though these are as adjuncts.

"ROOT AND STEM VEGETABLES"

is a book which treats *only* of those vegetables the root or stem of which is eaten, and is therefore especially valuable to all who are endeavouring to concentrate their attention on growing the most economical forms of food. It contains eight coloured plates reproduced from photographs.

To be obtained from—

PRICE 1/10 POST FREE.

MISCELLANEOUS.

THEY'RE NOT STICKY.

Beacon Oilskins are quite free from any stickiness, and, what is more important, they never fail to keep out the heaviest rain or sleet. Hundreds of farmers, gamekeepers, and other outdoor men, women and children wear them because they bring weather comfort. You ought to wear them if you want to keep dry in any drizzle. The Beacon Booklet will help you to choose the style you need. Children's Coats from 8/6. Men's from 9/5. Ladies' Smart Oilskins, 10/6. Long Leggings from 2/9. Soot-westers, from 1/5. Your money back if they don't satisfy you entirely. Send a postcard to-day for our Free Booklet of "Weather Comfort."—Send now—before you forget—to BARKER'S, LTD., 69, BEACON BUILDINGS, SOUTH SHIELDS.

GARDENER, as SECOND or SINGLE HANDED, experienced Inside and Out. Army discharge, married, 1 girl, 4 children, 12 and 14; wage 4/-, near E. London preferred. STAVELY, The Cottage, Pinner, Bar, Middlesex.

FOREMAN (INSIDE); life experience in good establishment; age 41, single, abstemious; Army discharge; old bodied; thoroughly practical; good Propagator, Decorator, Fruit, and Plantation, can put in large distances; no object; good refs., state wages.—FOX, The Gardens, Balm Lane, East Brompton.

GARDENER (age 29, intelligible) seeks situation as FOREMAN; general experience; good references. State particulars to BORNE, West Burton Corner, Norfolk.

JOURNEYMAN GARDENER seeks Situation in large Establishment, Fruit and Vegetable Garden preferred, discharged soldier, Apply, H. FOTHERGILL, 13, Rensell Place, Gloucester Road, Edinburgh.

LADY GARDENER seeks Post; Single-handed or under Head; chiefly Vegetables, Fruit, Poultry, see to any distance of London preferable. SYRETT, Four, Cottage, Borsham, Surrey.

SITUATION required by DECORATOR, and help in Glass; experienced private and trade; please state wages. MISS B. Box 22, 41, Wellington Street, Covent Garden, W.C.

TRADE.

FOOD PRODUCTION Advertiser desires responsible position, intensive crops, Pigs, Poultry, Fruit, Tomatoes, conserves in Lard products, also valuable table commodities, unique mail order paper (house "Stratford"), Llantarnwell, Angle-y.

WORKING FOREMAN; Grapes, Tomatoes, and Cucumbers, &c., life experience, reliable timekeeper and manager of men; above military age and used to Fruit growing on a large scale. H. SMITH, 67A, Deacon Road, Willesden Green, London, N.W.

MAN (42) seeks permanent Situation; ex-Army, married, 4 sons, Tomatoes, Chrysanthemums, &c., all over country. Kindly state wages.—WINGHAM, 51, Firth Road, Leytonstone, Essex.

WOMAN GARDENER wishes Situation with Market Gardener, Fruit and Vegetables; 15 months' experience Inside and Out, is also experienced clerk, shorthand typist; would assist part time if desired. 16, Kensington Place, W.

SWEET PEA PLANTS.

Autumn Sown. Cold Grown. PLANT NOW IN THE OPEN.

Send for our New List of 90 VARIETIES INCLUDING 20 NOVELTIES.

Table listing various Sweet Pea varieties with prices per doz. per Pink, Cream, Orange, Purple, Mauve, Blue, Lavender, etc.

Important.—We cannot too strongly emphasize the fact that these plants are Autumn Sown and Cold Grown. There is a vast difference between such plants and those raised in the Spring to Heat.

TOMATOES.

Table listing various Tomato varieties with prices per doz. Ailsa Craig, Comet, Pilibasket, Supreme, etc.

Early Cauliflower Plants 6d, 4, 10. TERMS: Cash on delivery. Please send extra for postage.

BUCKS, St. John's, IPSWICH.

MESOPOTAMIA IN JANUARY.

AS you go up the Persian Gulf, the barren, sun-dried, wind-eroded mountains of the Persian coast are sometimes visible to the east, and the equally bare and inhospitable Arabian coast to the west. Once in the Shatt-al-Arab, you soon realise what a desert Lower Mesopotamia is to-day, in spite of the proximity of the Garden of Eden. Both banks of the river are thickly clothed with Date Palms, but these extend no distance inland; here and there, and through gaps in the trees, you get glimpses of the desert, just a mud-coloured plain, as bare and flat as a billiard table.

We are camped on the edge of the desert in the neighbourhood of Basrah, about a mile from the river bank. Vegetation is almost entirely confined to the Palm groves which fringe the river and its numerous creeks. From the creeks shallow ditches are dug at right angles, and crossed in turn by other ditches at right angles—in fact, there is a ditch every few yards, and no tree is more than a dozen feet from water, though there is not now surface water in every ditch.

Compared with the sterility of the desert, the plantations are by contrast full of life, though from the outside these dust-smothered groves appear to offer few attractions other than a little shade, of which full advantage is taken by various transport units, many hundreds of mules being stabled beneath the Palms. Several small trees grow on the banks of the creeks, mostly belonging to the Leguminosae. Two are now in flower—one a Mimosa-like shrub or small tree, with fragrant orange flower balls, the other with sulphur-yellow Laburnum-like flowers. Two other trees of the same order, one of which is a fine shade tree, are not yet in flower. A fifth tree, also a good shade giver, is also without flowers, and there are a few Tamarisks. Several low-growing undershrubs, one Heath-like, another (popularly known as Camel Thorn) somewhat resembling Gorse, are met with, but none of them is in flower as yet. They grow scattered over the desert, especially on the lee side of old river banks, sheltered from the wind, as well as in the Palm groves, and all are very deep-rooted. At present all these desert plants are brown and shrivelled, in spite of the rain.

Curiously enough, one house in Basrah is festooned with Bougainvillea, whose purple

bracts, visible from afar, form the one bright spot in that dust-coloured city. Grape vines are not uncommon in the Palm groves, and a few are trained over pergolas in the city, but what the fruit is like I don't know; no fruit is to be had here till the spring. There are also a few miserable-looking Plantains, but not one of them looks as if it had ever produced a Banana.

In the mud of the ditches a semi-aquatic Ranunculus is flowering; some pools are actually covered with a species of Salvinia, and every ditch is as full of Convolvae as an East Anglian lode, for, though tidal, the water in the creeks sixty miles from the sea is not appreciably salt. The same cannot be said of the soil, however, for the desert is full of salt, and when the puddles dry up after rain, a glistening layer of salt, looking like hoar-frost, crystallises out. In the Basrah district this soil is at least three parts pure clay, a blazing white impalpable powder (on the surface) when dry, a sea of liquid grey mud when wet. The only place I have ever seen comparable to it is the Loess plain of Shensi, and that, of course, is fertile; but even in Shensi a white efflorescence of salt is to be seen on the Loess cliffs. When it rains here, which it does sometimes, the water stays on the surface, and our camp is turned into a mud bath. It takes a week's sun, with the chill *shamal* blowing all the time, to dry the desert after six hours' or no means heavy rain. On the other hand, after ten days' dry weather, the air is full of dust, which smothers everything.

However, our average rainfall, all of which is precipitated in the winter months, is six inches, and the ground beneath the surface is as hard as iron, and comes up in solid lumps of clay, though water is found almost everywhere six or eight feet down. If the rain fell in the vegetative season instead of in the winter, it is possible that the desert would be fertile, and one wonders whether, during the five thousand years or so which have elapsed since Biblical times, such a change in the seasonal distribution of the rainfall may not have taken place. But undoubtedly the main reasons for the change are to be attributed to neglect of the ancient irrigation systems and changes in the river beds.

That is certainly decidedly doubtful, and at Shahr, ten miles distant, whither I rode out one day to see the tombs of Hanu and the Queen of Sheba, there is a rise of twenty or thirty feet, and the clay of the Basrah district gives place to gravel and sand, where, amongst the Turkish trenches, I found about a dozen species of desert plants. They included a member of the *Salsola* group, an Umbellifer, and one of the *Cucurbit* family with globular fruits, and were all either thorny or possessed of fleshy leaves, with deep tap roots. Most of them formed compact rosettes or straggled prostrate across the sand. There is a grove of Tamarisks also, their glaucous green leafy shoots, swept by the wind, looking extremely graceful.

One day we walked over to Gurnat Ali, where the Tigre's and Euphrates unite to form the Shatt-al-Arab. Much of the desert about there is flooded when the rivers rise, and some of it is closely carpeted with waxy grass, brown and withered now, but turning green later. On the other hand, an island at the confluence is covered with green pasture—a welcome sight amidst the brown waste—where herds of sheep and cattle graze. Later, along the river banks and in the extensive marshes which occupy so much of the valley, tall *Phragmites* grow up and are cut in the winter to be used for fuel in the numerous brick kilns, or exported to India.

Another place I rode out to, ten miles across the desert, was Zabair, one of the most ancient cities in the world. There are no creeks in these desert cities, which depend for

their water entirely on wells, consequently there is no vegetation, and in the whole dust-coloured city of Zabair I did not see a single blade of grass or one green thing. On three sides there is limitless desert all round, but on the fourth side are gardens where Melons are grown, and also Date Palms and Tamarisks.

It is very cold at night, but warm in the middle of the day, except when the prevailing north-west wind—the *shamal*—blows; then it can be very bitter, and sometimes it is only a few degrees above freezing. Out in the desert ice forms on the puddles. Occasionally we have a thick mist in the morning, but that is exceptional.

It might reasonably be expected that in such a country there would be little animal life, yet birds of certain species are plentiful. Desert larks and kites, for example, are very common, and there are flocks of starlings, sparrows, and crows; kingfishers, doves, pelicans, and finches may be seen any day in the Palm groves, while hick and snipe are found in the marshes by the river. Every ditch is full of croaking frogs, and I have also seen a weasel, a bat, and a tortoise. Insect life is at present scarce, as is natural in such a flowerless land, but I have noticed a few small butterflies. One insect which requires no seeking is the common house-fly.

In the grey-green Palm groves are patches of cultivation which shine out like emeralds. Here Lucerne and Wheat are grown, and irrigated daily from ditches and wells. The water is scooped up in a basket attached to one end of a wooden lever supported between two mud pillars, which raises it the necessary four or five feet. By constant irrigation the salt is washed out of the soil, and no doubt this could be done everywhere, as water is always reached a few feet from the surface, which would bring the whole of the desert in the Basrah district, amounting to hundreds of thousands of acres, under garden cultivation.

Here and there Turnips, Cabbages, and Potatoes are grown, but only in small quantities. Melons can be obtained in season, and with the almost perpetual hot sunshine which prevails, it ought to be possible to ripen any fruit in the world here. Three things only seem requisite—firstly, to cleanse the soil of salt; secondly, to provide irrigation; and, thirdly, a proper system of manuring.

As to the first, it could be accomplished by irrigation on an adequate scale. The flooding of the Shatt-al-Arab in the spring, when the snow water comes down from Persia, converts vast areas into swamp and lake, and it ought to be feasible to hold up some of this surplus water, and irrigate the whole of the Basrah district with it. Something of the sort has, indeed, been done further north, the work being completed in 1914 in the teeth of Turkish sapineers. Further works had been projected, but never taken in hand by the Turkish Government. The great war here is freeword. There is practically none to be had locally, though just now the Arabs are cutting the woody bases of the fallen Palm leaves, and these are used for fuel. At Zabair, ten miles away, Tamarisk branches are used, and you see donkey-loads of white brushwood being sold in the market.

At present the Arabs are digging out the ditches, breaking up the clods in the patches set aside for vegetable cultivation, digging up new patches, and irrigating the old ones. This about sums up their agricultural activities preparatory to the hot weather.

Though here and there certain aspects of Lower Mesopotamia faintly recall scenes on the plains of China, on the whole it has an individuality so vastly different from that of any other country that one may be thankful to have seen it.

But one does miss the flowers! F. Kingston Ward, Indian Expeditionary Force, D.

NEW OR NOTEWORTHY PLANTS.

STAPELIA DUMMERI, N. E. Br.*

This is an interesting and very distinct species, which was discovered in Bukola, Uganda, in the

FIG. 44.—TREATMENT OF NEWLY PLANTED APPLE TREES. STANDARD TREE OF APPLE BRAMLEY'S SEEDLING, PRUNED IN FEBRUARY.

autumn of 1915 by Mr. R. A. Dummer, who sent dried material and living plants of it to me in July, 1916. Although of interest as being probably the only species from tropical Africa at present in cultivation (for tropical species of this group are but few, their headquarters being in South Africa), a further interest is added by the fact that at present its native habitat is unknown, for Mr. Dummer informs me that he has only seen it in the Plantain gardens of the natives, who have no idea of its origin, but cultivate it as a remedy for carache. Mr. Dummer writes that "The native name for it is Kaulira. The stems are broken and mixed with water, and the resultant liquid is then poured into the ear to relieve acute carache. The natives (Bacanda) affirm that it is efficacious. It is cultivated in their Plantain gardens occasionally, but is by no means common. I do not think that it is a native, as I have never seen a Stapelia growing wild here. It is very likely that it comes from the drier districts northwards, or possibly from some dry part of British East Africa."

The plant is also of interest on account of its structural peculiarities. In the habit and general appearance of its stems it is quite like the group to which the common *Stapelia variegata* belongs, and is also much like *S. Woodii* and *S. longidens*, whilst in its coronal structure it closely agrees with that of some species of *Caralluma*.

* *Stapelia Dummeri*, N. E. Brown. Caules decumbentes 6-9 cm. longi, 8-10 mm. crassi, cum dentibus acutissimis 8-14 mm. longis instructi glabri, cinereo-virescentes, papiraceo-vittati. Pedicelli 8-12 mm. longi, glabri. Sepala 4-5 mm. longa, 2 mm. lata, ovato-lanceolata, acuta, glabra. Corolla 3.5-4 cm. diametro, olivaceo-ochracea; tubus capsulariformis, 8 mm. longus; lobii patuli, 1.8-4 cm. longi, basi 4 mm. lati, dentibus attenuatis, acutis, dorso glabris, intra papillis cylindricis 1.15 mm. longis apicibus piligeris compressis. Corone lobii exte-riores papilloformis, 1 mm. longi, truncati, 4-dentati, dentibus lateribus curvato-divergentibus; lobii interiores super columnam staminum acute incumbentes, 2 mm. longi, re-ctangulares, apice 3-dentati.

and yet is not very dissimilar from that of *Stapelia longidens* and *S. Woodii*, so that it is intermediate between the two genera. The hairs on the inner surface of the corolla are quite unlike those of any *Stapelia* that I have seen, and more like those of certain species of *Uernia*, for instead of arising direct from the surface of the flower, each hair terminates a distinct cylindrical papilla that stands erect upon the surface. The following is a description of the plant:—

Stems decumbent at the base, 2½-3½ inches long and 4.5 lines thick, excluding the teeth, obscurely four-angled or subcylindric, toothed; teeth 4-7 lines long, about 1½ line thick at the base, spreading, rather slender, conical subulate, tapering to a very fine point; surface smooth, glabrous, light greyish-green, striped with purple. Flowers produced near the base of the young branches in clusters of 4-6, but developing singly. Pedicels 4-6 lines long, glabrous. Sepals 2-2½ lines long, 1 line broad, ovate-lanceolate, acute, glabrous. Corolla about 1½ inch in diameter, of an "olive-greenish-ochre colour," according to Mr. Dummer, with the united part forming a small cup about 2½ lines deep; lobes spreading, 6-7 lines long, 2 lines broad at the base, thence tapering to an acute point, smooth and glabrous on the back, studded with cylindrical papillae 1-1½ line long on the inner face, each papilla being tipped with a slender hair 1-1½ line long, producing a laxly hairy appearance, with the papillae and hairs standing erect from the surface. Outer coronal lobes arising 1-1½ line above the base of the stout staminal column, spreading, pocket-like, about ½ line long, and rectangular as viewed from above, 4-toothed at the truncate apex, with the lateral teeth diverging, curved, and the middle pair of teeth minute and contiguous, glabrous, apparently yellow. Inner coronal lobes closely bent inwards on the tops of the anthers and staminal column, with their tips crossing one another in a horizontal manner, not at all turned upwards, nearly or quite 1 line long and ¾ line broad, rectangular, 3-toothed at the apex, with the middle tooth usually much longer than the lateral teeth, acute, glabrous, apparently yellow. N. E. Brown

FIG. 45.—TREATMENT OF NEWLY PLANTED APPLE TREES. UNPRUNED STANDARD TREE OF APPLE BRAMLEY'S SEEDLING.

PRUNING NEWLY PLANTED APPLE TREES.

I AM distinctly in favour of pruning Apple trees the same season as planting, and for reasons which I will endeavour to show. The main consideration is how to obtain the greatest area of tree growth in the shortest time. The greater the area the better the prospect of fruit. Some argue that newly-planted trees should not receive two

FIG. 46.—TREATMENT OF NEWLY PLANTED APPLE TREES. RESULT OF PRUNING IN APRIL.

checks at the same time, and that the replanting of the tree does check the growth by interfering with its roots, while to prune the branches that season while the roots are in a crippled state is to give another check. "Let the tree alone," they continue, "until there is a balance between root and branch—that is to say, until the following year." Others suggest taking out the point of the shoots. This latter plan is, in my opinion, as bad as the first; along most of the shoots fruit buds form, and the removal of them hampers the progress of the tree.

It will be found very difficult afterwards to get them to make satisfactory growth, as many of the base eyes will have perished. Moreover, a newly-planted tree is often unable to make satisfactory progress, owing to the strain of supporting such a number of buds, extending often along the whole length of the shoot. When they are reduced in number by pruning, a much less arduous task is set before the tree.

In order to test the two methods, pruning and non-pruning, I planted in November, 1915, some standard trees of Bramley's Seedling. In February I pruned No. 1 tree as in fig. 44, cutting the seven 2-foot shoots back to within 6 inches of the base. The result in 1916 was ten long shoots and several small growths at the base of the tree, all giving promise of fruit. The shoots have been pruned to within 2 feet of their base. The diameter of the tree now is 2 feet 6 inches, a good foundation for future extension.

No. 2, fig. 45, unpruned, started with five main shoots and three smaller ones. The main shoots extended their length 9 inches with no added shoots, but many fruit buds have formed. Beyond the formation of fruit buds the tree shows no sign of progress or of extending its branch area beyond the 9-inch point at the apex.

No. 3, fig. 46, was pruned to within 6 inches of the base at the end of April. The resultant

growth consists of weakly shoots 8 inches long, showing that after the growth had started pruning was too late to be effective.

The fourth tree was unpurged. It has extended the main shoots to lengths of 5 inches and 6 inches, with no side growth whatever, but a plethora of flower buds. *E. Malpueur*

VEGETABLES.

PLANNING THE POTATO PATCH.

THE need for getting the largest possible yield from every patch is patent to all. Of course, much will depend upon the variety, but what are the most profitable distances for planting our Potatoes? For the last few years my patch has been laid out at the standard trial distances, 50 inches between rows and 18 inches between plants in the row for main crop; previously the distances were 26 inches and 15 inches respectively. Lately a correspondent has advocated these smaller distances, and claimed over 5 lb. per plant, and it seemed worth while to calculate the probable yields on a basis of a unit area. For simplicity, 100 square feet forms the basis of the following figures, which give the yield in pounds upon this area at different distances.

Yield per plant	26 in. by 15 in.	50 in. by 15 in.	50 in. by 18 in.
2 lb.	61.1		
2½ lb.	76.4		
3 lb.	91.7	79.5	
¾ lb.	110.0	92.8	76.0
4 lb.	122.5	106.1	86.9
4½ lb.	—	119.7	97.8
5 lb.	—	—	108.7

From this it appears that the shortest distances will give as much with an average of 2 lbs. per plant as the longest distances, give with an average of 3½ lbs. Mr. Curhisons in *Gard. Chron.*, March 10, 1917, p. 169, records a yield of Sharpe's Express at 15 inches per acre, and distances 76 inches x 18 inches; this works out at 4.2 lbs. per plant, and 77.1 lbs. per 100 square feet.

Last year, with crowded eulms (Early Adelaide) planted 24 inches x 9 inches, my crop was only 1.6 lb. per plant; whilst at 50 inches x 18 inches the maincrop gave an average per plant of 3.4 lbs. If the reader will compare these figures with the above table, he will see that the shorter distances are apparently more profitable up to a certain limit. But what is that limit? What is the minimum distance for any given variety at which it will yield, say, 3½ lbs. per plant?

In the past I have often endeavoured to get seedsmen to state what distances they would recommend for the planting of given varieties. It would appreciably enhance the value of a catalogue if information were given as to the smallest distances which would be profitable on given types of soil. It is always difficult to appreciate the records of Potato crops, because the results are so often given only in the yield of tons per acre, often, indeed, without any information as to the distances of planting. If the yield per plant were also given, the records would be much more intelligible and useful. In planning the planting of the Potato patch, we want to know the fair average produce per plant and the fair average number of plants per unit of area; and that unit of area should be a small one for the use of growers who have small gardens.

There would seem to be scope for trials on these lines in different parts of the country, and I rather think of having my planting done at different distances—viz., those given in the above table.

Another possibility is that alternate plants of different varieties might give a better yield than all of one sort. For instance, "calkies" might be interposed between "maincrops," when the ground would get both cultivation and clearance when the former were lifted.

Finally, I may point out the importance of actually weighing the crop, which can be done by those who do not possess a large weighing-machine or steelyard, if a series of plants are weighed separately by means of the ordinary kitchen scales. *H. E. Durham.*

Spacing trials with different vegetable crops are being carried out at Wisley. They were begun last year, and should lead to interesting results.—Eds.]

SCARLET RUNNER BEANS WITHOUT STICKS.

WHERE sticks for Runner Beans are difficult to obtain, and this is especially the case in some suburban districts, a good plan is to follow the advice given in a publication issued by the Royal Horticultural Society entitled *Economy in the Garden*. This is to grow Scarlet Runners on the field system, namely, without stakes. Thin to 18 inches apart and pinch out the top when it begins to run. Personally I prefer to put the rows 2 feet apart, with 1 foot between the plants. This system has been used by the market gardeners for years, as, when grown in quantity, the expenditure on sticks would form a considerable item even if they could be obtained. Under this field system one cannot count upon the fine, large, well-shaped pods that one sees at exhibitions, but as labour is so scarce this must be passed over, the object being to obtain good young Beans, and plenty of them. For this purpose the very large podded varieties are not the best, as they weigh down the branches, and, being thus brought so near the ground, are apt to get splashed by rains or attacked by slugs. *H. T.*

HOW TO PLANT POTATO SETS.

AN old and very wise gardener tells me that it is better to plant a Potato set not upright, but sloping to one side. He says that the shoots take longer to come through the soil and that when they do come they are sturdier and less easily broken when earthed up. Can any of your readers who have tried this method tell me if it has the advantages claimed for it? *J. N.*

SULPHATE OF AMMONIA FOR POTATOS.

THE interesting account of his experiments in manuring Potatos, on page 115 by Dr. H. E. Durham, the failure of sulphate of ammonia to give good results is probably to be ascribed to two causes—insufficiency of material used, and a wrong way of using it; 0 oz. oz. per yard is too little to be of any use. I take the writer's "yard" to be a lineal yard of the row, if it refers to a square yard, it is so much the worse. Anything less than 3 oz. per lineal yard of row would not repay the trouble of application.

Experiments made by me in 1915 showed me that it was of no use to apply sulphate of ammonia after the Potatos were covered in. It should be scattered along the top of the sets as soon as they are placed in the drill or trench, and be placed evenly throughout the whole length. Besides increasing the crop without damage to the sets, the good effects are also noticeable in the increased vigour of the seed Potatos.

Moreover, if sulphate of ammonia is used for early Potatos, and these are followed by a crop of Cabbages for autumn use, it will be seen that the Potatos have left part of the manure for the benefit of the succeeding crop. *H. H. Pierce, Westdown, Hook, Sarburyn.*

A DETAIL IN POTATO CULTURE.

AT the present time, when inexperienced people are for the first time taking up Potato cultivation, practical notes relating to unfavourable conditions may be useful. As to dates of planting, in warm light soils, placed in elevations free, or comparatively so, of late spring frosts, planting can be safely and advantageously carried out weeks earlier than it would be wise to do it in low situations. Here, for instance,

except in cases where extra precautionary measures are taken, planting is delayed as late in the season as is possible in order to escape injury from frosts. For this reason pains are taken to retard the sprouting of the "seed" by keeping it as cool throughout the winter as is consistent with safety. At the present time the "seeds" for main crops are placed on end upon shelves in a light, airy shed situated under a north wall; by these means it is possible to delay the planting season for a considerable time, but even after these precautions are taken the plants do not at all times escape damage from frost, and in order to counteract its effects they are sprayed with cold water early in the morning before the sun gains power. It is also better where the land is cold and heavy, even if the situation is not subjected to late frosts, to delay the planting season until the soil increases in warmth, as by so doing the plants at once start into vigorous growth, and by this means increase their productiveness. *Thos. Coulmer, The Hendre Gardens, Monmouth.*

THE MARKET FRUIT GARDEN.

LUCERNE ORCHARDS.

IN anticipation of shortness of labour and a great advance in wages, it is my intention to try the experiment of growing Lucerne in my mature Apple orchards, from which Currant bushes have been removed, provided that I can get the land cleared of weeds in April or May. The Lucerne would require to be cut twice in the season, and would be left to rot on the ground as manure, making another economy beside saving of wages. Further, damage to trees by horse cultivation would be avoided. Grass would grow among the Lucerne plants, no doubt; but it is hoped that the latter would preponderate. The chief doubt of success is as to whether the Lucerne will flourish under the shade of the trees. At any rate, there will be enough of it for a long time to afford a valuable mulch for the trees.

PRUNING SCABBY APPLE TREES.

IN pruning Apples showing scab on the young wood there is an important point to bear in mind. The scabby shoots must be either cut off entirely or below the diseased portions; but any young wood free from scab may with advantage be left entire if there is plenty of room for it. The reason for this suggestion is that scab attacks only wood of the first season's growth, so that a new shoot left entire will not be attacked next summer, though the leaves may show the disease. Of course, if it sends out extension growths, these may be attacked, but a shoot left entire is much less likely to branch out freely than a cut one, and often it forms fruit buds along nearly all its length, without branching at all. The work of cutting off scabby parts of shoots among my Cox's Orange Pippin trees is so tremendous, year after year, that any expedient for reducing it is important. By the way, I find that one variety of Apple other than Cox's Orange Pippin, among the sorts that are in my orchards, has scab on the wood, though it has more canker. This is Warner's King. Besides these two varieties, Mr. E. S. Salmon, in a leaflet upon the disease, names Lord Suffield, Ecklinville Seedling, Yellow Ingestre, Dumelow's Seedling, Cox's Pomona, Councillor, White Transparent, and Keswick Codling, as subject to scab on the wood; but not one of these varieties is included in my orchards. To my astonishment he also includes Mr. Gladstone, which with me is, of all varieties, the most free from scab, canker, or any other fungous disease. So far as my observation is to be trusted, scab alone never kills

a shoot; but canker spores very frequently gain access through the wounds made by scab, and then the shoots are often killed. But scabby shoots must be cut off below the infested parts nevertheless, as they would infect the leaves and the fruit if left on the trees. Where, in pruning at the present time, a shoot that was scabby a year ago, is found to have been missed, the scab marks have callused over, and the disease on this two-year-old wood seems to have died out. Mr. W. F. Emptage informs me that he has recently seen a piece of Devonshire Quarrendens, which show that they were badly attacked by scab in 1915, the diseased shoots having been left on the trees. The scab scars had healed, and, astonishing though it seems, the extension growths of 1916 are free from the disease. This, by the by, adds another to Mr. Salmon's list of varieties which he has found subject to scab on the wood. Mr. Emptage agrees with me in concluding that scab alone does not kill a shoot. It can hardly fail, however, to impair vigour.

PRUNING AGAINST BROWN ROT.

On November 25, 1916 (p. 251), the importance of cutting off every twig, spur, or blossom affected by brown rot as soon as an attack is noticed, was urged. The best time is when, or shortly before, the blossoms show. That importance is strikingly noticeable when pruning during the winter, for it is found that the malady in diseased spurs which were missed at the time named, when women were employed to cut them off the trees, has extended into the wood of the branches forming brown rot cankers. These (*Sclerotinia frutigena*) cankers are quite different in appearance from the ordinary (*Nectria ditissima*) cankers. Instead of forming bulging swellings, as the latter do, the former are depressed, the bark attacked being dead, and the wood under it brown, and at least partially dead. The rotten bark may be pared off as far as it extends, and a little of the sound bark, if any, around it, dressing the place with Stockholm tar. Such treatment does not always prevent the disease from extending all round a branch, killing all the portion above the wound; but it frequently preserves a fruiting branch for a few years. Nearly, if not quite all, the brown rot cankers are caused by the fungus extending from diseased spurs into the branches. A search for half an hour among trees particularly subject to brown rot failed to disclose one instance of a canker having been caused otherwise than by means of a diseased spur, and large numbers were examined in that time. Subsequently the question has been borne in mind while pruning, with the same result. It has occurred to me that spores of brown rot may possibly find entry into a scab scar; but no evidence to that effect has yet come to my notice. Apparently all, or nearly all, the brown rot cankers noticed in pruning recently might have been prevented by the prompt cutting off of attacked fruit spurs, mostly when in blossom. The tops of young shoots of Apples and Plums, as well as spurs, are often attacked by brown rot. These die off entirely, as far down as the disease extends. A mummified fruit pressing against a branch may produce a canker, as it softens the bark, and thus lets spores into the wood; but, as I have all such fruits removed from the trees, cankers rarely arise from that cause in my orchards.

COB NUTS

At present circumstances are favourable to the prospects of a fair crop of Cob Nuts after last year's failure. There is an abundance of catkins, and only a few female blossoms here and there were to be found at the end of February. This lateness is a safeguard, as the female blossoms so often run grave risks of injury from late frosts. *Southern Crooner*

TREES AND SHRUBS.

BAMBOOS GROWN IN SHADE.

As an ardent admirer of Bamboos for ornamental gardening, I was very interested in Mr. Levett's remarks on p. 83. I first grow Bamboos in the South-east of Ireland about twenty years since, and about eleven years ago planted a collection here (Eastwell Park, Kent), which now embraces most of the hardier varieties in cultivation. On the subject of shade, I have always had the impression that Bamboos really did best in moderate shade, and that the beauty of the plants was seen to the best advantage when associated with the relief given by the shadows of tall trees. In my visits to several very fine gardens in Ireland, famous for beautiful specimens of the Bamboo, I saw many fine clumps growing in shady places. I have not planted them myself in such dense shade as that described by Mr. Levett, but we certainly have fine groups growing in semi-shaded positions. The Queen of Arundunarias, *A. nitida*, seems to be especially suitable for damp and shady positions; also *A. spatuliflora*. Both these species show distinct signs of distress when exposed to the full glare of the mid-day sun during continued hot weather. Mr. Levett's success with *A. insignis* interested me most, as I have not ventured to plant that species outside. When Messrs. Gauntlett introduced the plant some years ago, they laid particular stress on its tenderness. Having some very tall, bare pillars in a large winter garden, and having tried several climbers without success, I procured two plants of *A. insignis* when it was first offered. These grew so well that I divided them, and have now four nice specimens, which clothe the pillars beautifully. I can fully bear out your correspondent's remarks as to its remarkably quick growth. A year or two back, a shoot had grown with extraordinary vigour, and, being curious to know its exact height, it was measured with a tape, and proved to be 27 feet 4 inches from the ground to the tip. I had not met with anyone who had grown this plant out of doors, but shall certainly give it a trial. This winter will test the hardiness of Bamboos as well as other plants, as we registered 20° and 23° of frost during February, but the Bamboos look like standing it very well. My experience proves that planting in wind-swept situations is responsible for many failures with these choice plants; shelter from strong winds is essential. *J. G. Weston, Eastwell Park Gardens, Kent*

PLANT NOTES.

TELOPEA SPECIOSISSIMA.

This Australian member of the Proteaceae flowers but rarely in this country, therefore a note of its being in bloom at Kew, as recorded in the *Gardener's Chronicle* for March 17 (see p. 119), was of especial interest, whilst the illustration of a head of blossoms well showed the character of the inflorescence. The first time it was my privilege to see it in flower under cultivation was in the gardens at Pendell Court, then in the occupation of the late Sir George MacLeay. This was in the spring of 1882, and the flower-head was exhibited at the meeting of the Royal Horticultural Society on April 11 of that year. It was then given the award of a Botanical Certificate, and was the most-talked-of exhibit at the meeting. More than 30 years afterwards, namely, at the Chelsea Show of 1914, a fine head was shown from the Cornish garden of the Rev. A. T. Boscawen. It was then by many looked upon as a novelty, the fact of its having flowered so many years previously being unknown to many of the present generation. On this, its second appearance before the Floral Committee of the Royal Horticultural Society, it was awarded a Cultural Commendation. *H. T.*

THE "HARDY" FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. F. DAVEY, Abbots Wood, Godalming, Surrey.

GRAFTING.—It is time to make a start with the grafting of fruit trees, the stocks having been previously headed back. Make an examination of the bark to see if it will lift freely, and if it does, the grafting may be commenced. Healthy old trees of worthless varieties can soon be made into profitable trees of good varieties by re-grafting. In the case of these old trees crown grafting is best, and three or four scions should be put on each branch. The branches intended to be grafted should be cut back to within 2 feet of the main stem. Make the surface smooth with a sharp knife, then make a cut through the bark downwards 2 or 3 inches long. Afterwards prepare the scion, which should be from 4 to 7 inches long, and cut it in an oblique manner, the same length as the cut in the stock. Take great care to see that the bark of the stock forms a perfect union with the bark of the scion. Tie with raffia or soft string at once, then smear the junction with the preparation of clay made as advised on p. 125. I always tie a little damp moss on the clay, to keep it from cracking in dry weather. Seedling stocks should be whip or cleft grafted, this being the most suitable method for small trees, such as cordons, bush or pyramids. Cut the stock evenly in an oblique manner, then take the scion and cut it in precisely the same way for about 1½ to 2 inches in length. Make a small tongue upwards in the scion about half an inch from the top, and make a cut in the stock to correspond with it. As soon as the graft is fixed, bind it at once, and cover the junction with the clay mixture or grafting wax. In very dry weather spray the graft with water to keep it moist.

GENERAL REMARKS.—Finish the work of cleaning, pruning and tying all kinds of fruit trees. See that all stakes supporting fruit trees are in perfect order and able to withstand the strain of gales and support heavy crops of fruit. Most trees are very backward, but promise well for good crops. Have light material in readiness to protect the blossom from frost, but do not use it unless it is absolutely necessary. If rains have washed off the specific recommended on p. 97 to protect the buds from birds spray again with the solution. Ventilate the fruit-room daily to keep the air sweet and fresh. Remove all fruits that are at all spotted to prevent the sound fruits becoming affected.

THE KITCHEN GARDEN.

By J. DUNN, Foreman Royal Gardens, Windsor.

PEAS.—Plants which are being grown under glass for planting out of doors should be ventilated freely and hardened gradually, so that they may be planted as soon as the weather is favourable. In planting, preserve the roots from injury, and, as soon as the work is accomplished, dust soil along the rows and place short sticks for support. Protection should also be afforded from winds, and plants just showing through the ground should be protected from birds. Nets may be stretched over the border at once, and a few Spruce or other evergreen branches placed in a position to obstruct the winds. Successional sowings should be made as they become necessary to maintain an unbroken supply of pods, selecting rich ground which has been trenched and manured in winter.

HOEING.—When the soil is sufficiently dry, hoe the surface freely amongst young crops. Winter Spinach, Parsley, and seedling Cabbages will be benefited by hoeing the soil and cleansing the ground.

SEAKALE.—Owing to the scarcity of green vegetables Seakale has become an important crop, and those with a good stock of roots for

forcing indoors and in the open may be able to produce this vegetable in quantity throughout the winter and spring without a break. The present is the best time to make preparation for next season's crop, selecting rich ground for planting. For forcing in the open the thongs should be planted in clumps of 5 or 6 to permit of covering the crowns with Saksale pots the following spring, for it is a distinct gain to cover as many crowns as possible with one pot without overcrowding the plants during the growing season. Sufficient space should be allowed between the clumps for the fermenting material which is necessary to produce the required warmth next spring. The very best Saksale is obtained from these outdoor plantations, and they prolong the supply. Roots lifted from the open late in the spring seldom furnish produce of first quality. As soon as the thongs are sufficiently advanced the planting of the main crop should be done. If the ground has been dug and manured in winter, fork over the surface, and when the ground is sufficiently dry, make drills 2 feet apart and set the roots with an ordinary dibber at 14 inches apart in the rows. Fill the holes by drawing the crumbling soil over them with a hoe. Nothing further will be necessary until the young growth is 2 inches high, at which stage the crowns should be thinned carefully, leaving only the strongest growth on each plant.

SEED-SOWING.—Make the final sowing of Brussels Sprouts on an open border. The best and hardiest plants may be expected from this batch, for plants raised under glass and pricked out frequently become drawn before they are ready for planting in the open. Sow the seeds thinly in shallow drills, and allow sufficient space between the rows for a free use of the Dutch hoe, and keep the bed free from weeds. Cabbage also may be sown now for supplies in July and August. Cauliflower seed should be sown in rather poor soil; plants raised in this way will be hardy, and make steady growth. Magnum Bonum, Early London, Autumn Giant, and Halloween Giant provide a good succession. Seedlings of these varieties should be planted as soon as they are of sufficient size in ground which has been prepared for them. Cauliflowers require rich soil, and the plants must never be allowed to become stunted for want of water at the roots. Net the seed-beds as soon as the seeds are sown, and guard against slugs, which are easily destroyed by hot lime.

CELERY.—As soon as Celery seedlings are large enough to handle, transplant them either in boxes or shallow frames filled with fine, rich soil. Allow plenty of space between the plants. The principal sowing of Celery should be made at once in a bed of fine, rich soil, placed within 1 foot of the roof glass. Sow the seeds thinly. The light should be kept closed until the seeds have germinated, after which air should be admitted whenever the weather is favourable. As time advances the lights may be removed entirely during mild days. Celeries may be sown now and treated in the same manner as Celery.

RHUBARB.—The present is a good time to make new plantations of Rhubarb. The soil should be trenched or dug deeply, and enriched with a heavy dressing of farmyard manure. Make the rows 5 feet apart and set the roots at least 4 feet apart in the rows. Apply a mulching of long manure to the crowns when the planting is finished. Rhubarb in the open should be protected from cold winds and frost by shaking a quantity of long litter over the bed, taking care to place the straw as lightly as possible over the plants. If the material is dry a covering of 9 inches may be applied. If the mulching material remains in position throughout the summer it will help to keep the bed free from weeds.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

SHADING AND VENTILATING.—With the lengthening days and the increased amount of sunshine, careful attention must be given to the question of shading and ventilating each division. The growths now developing are very tender, and may soon be scorched and disfigured

if unduly exposed to bright sunshine. It is advisable to be on the safe side, and not expose the plants to too much of the sun's influence. At the same time the blinds should not be allowed to remain down too long. Already the warmth from the sun has on several occasions had the effect of considerably raising the temperature of the house, but cold winds often accompany bright sunshine, and it is not advisable to admit cold air in too great quantity. On such occasions use the blinds, and when the outside temperature exceeds 45° the amount of ventilation may be increased and shade afforded with discretion. Admit the air through the ventilators under the stages, if possible on the side of the house that is most sheltered from the wind. These remarks apply more especially to the cooler houses containing such plants as *Odontoglossums*, *Masdevallias*, *Oncidiums* and the cooler *Cypripediums*. The Cattleya and intermediate houses will only require shading for an hour or so during the middle of the day. Any of the inmates of these houses that may require an extra amount of shade should be placed at one end, where they may be shaded independently. Many occupants of the East Indian or warm house, such as *Phalaenopsis*, *Bulbophyllum*, *Trichostelium*, *Angraecum* and the warmer *Cypripediums* will require protection from the sun. *Bollea*, *Pescatorea*, *Warszewiczella* and the small *Zygopetalums* should be shaded at all times.

WATERING.—Atmospheric moisture should be increased as the season advances. Each department will require damping down every morning and the operation should be repeated twice or thrice on bright days. Many plants will now require an increase of water at the roots, but in moderation, the quantity varying according to whether the plant is in active growth or dormant. On bright days *Cypripediums*, *Odontoglossums* and seedlings of all kinds will be benefited by occasional overhead sprays. The temperatures may now be slightly raised. As a guide the following table may be useful:—
East Indian House, day 70°, night 65°.
Cattleya and Intermediate House, day 65° night 60°.
Odontoglossum House, day 55° to 60°, night 52°.

Seedlings of both *Odontoglossum* and *Cattleyas* should be afforded slightly higher temperatures than those applied to established plants.

FRUITS UNDER GLASS.

By Jas. Henson, Gardener to LEOPOLD DE ROUSSILLE, Esq., C.V.O., Gunnersbury House, Acton, W.

FIGS IN POTS.—Fig trees in pots that were started in the autumn are ripening their earliest fruits. At this stage keep the atmosphere somewhat drier and discontinue syringing. Do not, however, allow the roots to suffer for want of water, as any undue stress put upon the foliage may cause root rot to spread. Shoots that show a tendency to grow too freely should be stunted rather than allowed to grow. The earliest trees may yield satisfactory crops, as a rule greater fertility may be expected from trees that were not started until the new year, and these should be growing freely. Possibly they may be developing an undue number of fruits, in which case they should be thinned in good time, removing those that are badly placed, crowded, or deformed. These later plants should now be top-dressed as advised on p. 96 for the early batch. Brown Turkey is a splendid variety for this second crop. The later batch of pot trees will soon start into growth, even if kept moderately cool. Negro Large and Bonjassette Grises are two of the best varieties for late cropping. It is not necessary when growth has started to hasten its development by the use of fire-heat. I noticed to-day that our late plants are breaking slowly, and, as room is limited, they will not be hastened. Give every possible attention to young trees in pots, including those struck from eyes this spring.

TRAINED FIG TREES.—The earliest trained Fig trees are in free growth, and showing fruits. Stop the side shoots at five or six leaves, but not the leaders. As soon as the fruits commence to swell stopping the shoots will assist

their development. Crowding of the new growth, a common error with some growers, must not be permitted. Where the leaves are too numerous for their proper development the removal of a long, straggling unfruitful shoot will help to correct matters. Ventilate the house somewhat freely, and see that the atmosphere is not excessively moist. Syringing once a day should suffice to keep down insect pests. Fig trees in cold houses will soon commence to grow, and should be syringed at least once a day. If there are no other plants in the house that will be affected, reduce the amount of ventilation. Guard against overcrowding of the shoots, removing surplus growths at once.

THE FLOWER GARDEN.

By W. J. CRISP, Gardener to Mrs DEMPSTER, Keele Hall, Staffordshire.

PRUNING ROSES.—The pruning of Hybrid Perpetual Roses should be commenced. Young plants should be cut hard back to obtain strong growths from the base. In the case of older, established plants, cut out all the old wood, weak growths, and superfluous shoots from the middle of the trees. In low-lying districts subject to late frosts delay the pruning for a week or two. The beginning of April will be soon enough to commence pruning Tea and Hybrid Tea Roses. These should be cut back to about 6 inches of the base, according to the strength of the shoots.

VIOLETS.—Select the strongest Violet runners from the old plants, with roots adhering if possible. Insert them in sandy soil in a close frame at 6 inches apart. Light sprays with tepid water will be beneficial. Directly the plants are rooted the amount of ventilation should be increased, gradually hardening them, preparatory to planting them in the open. Prepare beds in readiness for planting the runners outside next month.

GLADIOLUS.—In light, warm soil, it is not too early to plant autumn-flowering Gladioli where they are intended to flower. A liberal dressing of decayed manure or leaf-mould well worked into the soil will be beneficial. In the case of cold, heavy soils, it is better to place the corms in pots or boxes filled with a rich compost, and start them in a close frame for planting out of doors early in May. Halley, light salmon; Baron Hubot, deep blue; Albion, white; Princeps, scarlet; Golden West, orange-salmon; Debonair and Panama, pink, are all good varieties.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHWOT, Eastwell Park, Kent.

ASPARAGUS MEDIOLOIDES (MEOEOLA ASPARAGOIDES).—Plants of *Asparagus mediooides* raised from seed sown early in the year should be potted into 60 sized pots before they are far advanced. Grow the plants on a shelf in the propagating house or plant stove, and shift them into larger pots before they become potted, or they may be planted out if under a board, or they may be planted out of the back wall of a Vinery. A border at the foot of the back wall of a Vinery is a good place in which to grow this *Smilax*. Guard against the young shoots becoming antailed by training them singly on the special green thread sold for the purpose. Grow in this manner the long, graceful trails may be easily cut as required. When established and in full growth the plant requires an abundance of water, and should be syringed two or three times daily. Stimulants also are needed, soft water alternated with artificial being suitable. Fumigate the house to keep down green fly. Dense shade and plenty of heat and moisture are needed to develop the delicate shade of pale green which is so much admired in this delightful foliage plant.

BLINDS.—All kinds of blinds used for shading plant houses should be overhauled, and any that need repairing attended to. Roller blinds may be placed in position to be ready for use whenever required. The danger from insufficient ventilation is not so great when a moderate amount of shading is employed.

EDITORIAL NOTICE.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication.—As well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR APRIL.

THURSDAY, APRIL 5—
Manchester and N. of England Orchid Soc. meets.
MONDAY, APRIL 9—
B.G.A. Conference at Birmingham.
WEDNESDAY, APRIL 11—
Roy. Hort. Soc.'s Coms. meet.
THURSDAY, APRIL 12—
Roy. Hort. Soc.'s Daffodil Show (2 days)
THURSDAY, APRIL 19—
Manchester and N. of England Orchid Soc. meets.
THURSDAY, APRIL 26—
Roy. Hort. Soc.'s Coms. meet. Nat. Arctiella and Primula Soc.'s (Southern Section) Show with R.H.S.
THURSDAY, APRIL 26—
Midland Daffodil Soc.'s Show, Birmingham Bot. Gdns. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 45.6°.

ACTUAL TEMPERATURE—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, March 29 (10 a.m.): Bar, 29.0; temp, 47.5°. Weather, Cloudy.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—
Sale of Fruit Trees, Roses, Lilacs, Herbaceous Plants, &c. at 67, Chesham, by Protheroe and Morris, at 12 and 3 o'clock.

Vegetable Seeds.

It is important that gardeners should exercise every economy possible with respect to vegetable seeds. The need for this economy will be manifest to everybody. On the one hand, the disturbance and delay of transport make it more difficult than in normal times to obtain the supplies which come to us from different parts of the world; on the other hand, vegetable seeds are being sown on a vast scale, and many of those who are sowing them have no great experience of gardening. Many gardeners even are apt to sow more thickly than is necessary, and amateurs, though they may have learned from books the proper distance at which seeds should be sown, are apt to find that the operation of seed-sowing is not so simple as it might seem, and fail to put precepts as to thin sowing into practice. We advise all gardeners to use the remains of last year's seed packets before opening those of this year. In the case of many seeds the fact that the seed is a year older makes very little difference to its germinative power. The garden legumes,

for example, Peas and Beans of various sorts, lose their power of germination only very slowly, and seed of the 1916 or even 1915 harvest, if it has been kept under moderately fair conditions, will be found to germinate quite well.

Everyone who has old seed should test its germinating power, comparing it with that of this year's seed. Provided that the percentage of germination is not too low, the seed with the lower germinating power should be used, and that with the greater power of germination should be reserved for next year, when it is highly probable certain kinds of seed will be very scarce. For example, if anyone has the good fortune to find that Parsnip seed of this year gives a percentage of germination well over 40 per cent., and if the seed remaining from last year still germinate to the extent of 40 per cent.—which, we fear, is not very likely—last year's seed, fortified with some of this year's seed, should be used. It is true that Parsnip seed does not retain its power of germination very long, and that seed bought this year will be found by next year to have lost a considerable part of its power of germination; nevertheless, by adopting the course suggested the gardener will be making the best of a rather bad job.

He should, moreover, regulate the thickness or thinness of his sowing according to the results of his germination tests. As everyone knows, it is quite easy for anyone to ascertain the percentage of germination of a sample of any ordinary seed. Two saucers lined with moistened flannel or blotting-paper, one containing fifty or twenty-five seeds (according to size) the other inverted over it, serve perfectly as a germinator. If kept in a warm place and prevented from becoming dry, the seeds in the germinator push out their roots. As they do so they are counted and removed. The time which seeds of different kinds take to germinate varies very considerably; but the time is shortened if the seeds are first soaked in water.

Another way in which economy in seeds may be practised in the case of seedlings which stand transplanting is by sowing only a part of the quarter devoted to the crop and pricking out the thinnings over the rest of the quarter. Given care, and, above all, immediate transplanting, many seedlings may be treated in this manner. We would urge our readers to adopt every economy in the use of vegetable seeds consistent with cultivating all the land they can.

Furthermore, we advise those who have roots—Beet, Carrot, Parsnip—of last year's sowing, or plants of Leeks or Celeriac, still in the ground, to try the experiment of growing all of them that they can spare for seed purposes. It is true that some vegetables ripen their seeds only somewhat indifferently in this country, but, given a good season, a certain amount of seed may be obtained in this way. Lastly, we suggest that everyone should save a fair amount of seed of Peas, Broad Beans, Runner Beans, French Beans and Haricot Beans, for next year's planting.

HORTICULTURE IN HOLLAND.—Most of the Dutch market-garden produce has, until lately, sold at remunerative prices, but growers complain of the Government restrictions on their holdings. A part only of the vegetable crop may be sold in the open market for export (to Germany), the remaining produce has to be retained for home consumption, and sold at low prices. The production of luxuries and the less necessary vegetables is compulsorily curtailed, and only permitted to those growers who have always devoted part of their land to such cultures. Although, on the whole, Dutch market-gardeners have reason to be satisfied with their present situation, they foresee a crisis after the war. They fear a general economic war in which neutrals—and especially the Dutch, whose agriculture and horticulture are dependent on foreign markets—will be severely affected. They do believe that the belligerent nations will be so exhausted that it will be almost impossible for them to buy the horticultural produce in which Holland has specialised.

SUMMER ROSE SHOW ABANDONED.—The National Rose Society has decided not to hold its Metropolitan Show at the Royal Botanic Society's Gardens this year mainly owing to the difficulties attending railway transport. The question of the autumn show will be considered later.

STATE AID FOR ITALIAN NURSERIES.—The Board of Trade Journal reports that the Italian Minister of Agriculture has announced his intention of establishing in the chief cities of Italy large model nurseries for the production of herbaceous plants. The Ministry will grant subsidies to cover the expenses of these establishments.

"SANDERS' LIST OF ORCHID HYBRIDS."—A supplement to this useful work has now been issued, bringing up the entries of novelties to the beginning of the present year on the same lines as the original publication, which included all up to midsummer, 1915. The large number of new records, as disclosed in the supplement, speak well for the diligence of the raisers of Hybrid Orchids.

POTASH FERTILISERS.—It is satisfactory to learn from the report issued by the Board of Agriculture that a process has been discovered whereby the extraction of potash in soluble form from felspar may be carried out profitably. In order for this to be done it was necessary to produce from the felspar a second product of market value. The process, invented by Mr. J. RIBOX and investigated by the Board, admits of the production of a potash fertiliser and a white cement.

FINGER AND TOE.—A leaflet issued for the benefit of farmers and gardeners in the Eastern Counties gives a brief account of club root, or finger-and-toe. It insists on the importance of liming as a means of getting rid of the pest, and advises the use of bone-meal, steamed bone flour, or basic slag in preference to superphosphate, and nitrate of soda in preference to sulphate of ammonia. Gardeners who are troubled with this pest will do well to dig in in autumn a heavy dressing of quick-lime (2-1 lb. per square yard) rather than to rely on the use of slaked lime or chalk.

THE GROWTH OF APPLE ROT FUNGI AT DIFFERENT TEMPERATURES.—An interesting account of the effect of temperature on the growth of different fungi affecting the fruit of the Apple is given by Messrs. BROOKS AND COLLIER. The important conclusion to be drawn from their investigations is that the initial

Journal of the Board of Agric., Feb., 1917.

J. Leadet No. 2, Eastern Counties School of Agriculture, Cambridge.

Temperature Relations of Apple Rot Fungi," Jour. of Agric. Research, VIII, 4, Washington.

stages of growth of these fungi are more checked by low temperatures than are the later stages, and therefore immediate storage in low temperature is the best means of checking the development of Apple rot fungi.

A VETERAN GARDENER.—MR. HENRY JONES celebrated his jubilee of service at Carrow House, Norwich, a couple of years ago. Forty-four of the fifty years had been spent as gardener to the Colman family, one of the most distinguished members of which is Sir JEREMIAH COLMAN, Bt., so well known to our readers for his successful Orchid cultivation at Gattin Park, Reigate. Mr. Jones is a native of Surrey, and in his early years he was employed in Messrs. ROLLISON'S nursery at Tooting, and in the nursery of Messrs. B. S. WILLIAMS AND SON, Holloway, from which place he went to Carrow in 1865.
